2635. Taylor, James B., Haelele, Ethel; Thompson, Prescott, & O'Donoghue, Cathleen. (Menninger Foundation, Topeka, Kan.) **Rating scales as measures of clinical judgment: II. The reliability of example-anchored scales under conditions of rater heterogeneity and divergent behavior sampling.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 301-310.—4 example-anchored descriptive rating scales were developed which measure coping adequacy, physical health, informal support, and financial comfort. Mental health professionals and gatekeepers rank-ordered 30 authentic geriatric cases on each variable. After the scales were developed 15 professionals untrained in the rating technique rated clients familiar to them on the 4 example-anchored scales. Ratings were pooled and correlated with those of 2 clinicians. Interjudge reliability ranged from .77 to .87. Correlations between the scales within each group were moderate. "It is suggested that the new technique greatly reduces variance arising from instrument error, and that high interjudge reliability is apt to be found when (a) the trait being judged is stable across situations, and (b) when global judgments are required."—N. M. Chansky.

BEHAVIOR DISORDER

2637. Alderton, Harvey R. (U. Toronto, Ontario, Canada) **A comparison of the follow-up status of children's aid society wards and non-wards treated in a children's psychiatric hospital.** *Canadian Medical Association Journal*, 1969(Jun), Vol. 100(22), 1035-1042.—Compared 2 groups of 6-12 yr. old boys with serious acting-out behavior disorders following discharge from a children's psychiatric hospital. The groups were

comparable with regard to age, intelligence, duration of hospitalization, degree of disturbance, and interval since discharge. Wards had previously suffered more relationship losses than nonwards, the latter having generally remained with parent figures throughout life. Because of the adverse effects of repeated relationship loss, it was predicted that wards would be more poorly adjusted at follow-up, however the contrary was found to be true. Reasons are presented for concluding that the wards had made a better treatment response during hospitalization. The nonwards' prolonged contact with severely disturbed parents may result in behavior patterns which are harder to change than those of wards. However, factors operating during the stay in hospital may be responsible. These include a greater tolerance by wards of unavoidable relationship losses in the treatment setting, as a result of experience. Nonwards may be less significantly involved with treatment staff because of continuing external parental relationships, or their disturbance may be reinforced by parental visiting. (French summary) —*Journal summary.*

2638. Moran, E. (N. Middlesex Hosp., London, England) **Varieties of pathological gambling.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 593-597.—Survey of 50 persons whose excessive gambling resulted in personal or family problems suggests a 5-fold classification. 1/5 showed loss of control and may be considered the impulsive variety. 1/3 appeared to be neurotic, 1/4 were psychopaths, and subcultural and symptomatic varieties completed the group. Gambling may provide some relief from symptoms of tension and depression, and it can also be self-destructive in the context of the guilt feelings that occur in depression.—R. L. Sulzer.

2639. Paulson, M. J. & Blake, P. R. (U. California, Center for the Health Sciences, Neuropsychiatric Inst., Los Angeles) **The abused, battered and maltreated child: A review.** *Trauma*, 1967(Dec), Vol. 9(4), 1-3.—Attempts to "summarize all the pertinent articles on the subject through October 1967. The specific problems discussed are: What is the incidence of child abuse? What are the medical manifestations which differentiate such assault from other medical and legal problems? What are the social factors which contribute to the continued and apparently increasing pattern of parental behavior? What are the personality patterns which characterize such parents? What can society do to recognize this potential behavior within an individual, and once such preventive clues are found, what intervention procedures can be initiated to protect not only the rights of the child from abuse, but also to protect the parent from false and malicious accusations when justifiable and appropriate disciplining is administered?" The hope is expressed "that sound medical and psychological premises can be developed rapidly that can be used as guidelines of practice for both bench and bar."—I. N. Mensh.

2640. Sutker, Patricia B. (U. Georgia) **Vicarious conditioning, empathy, and sociopathy.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5703.

Drug Addiction

2641. St. Pierre, C. Andre. (Boston Dept. of Health & Hosp., Drug Addiction Treatment Unit, Mass.) **A treatment program for the drug-dependent patient.** *Social Work*, 1969(Oct), Vol. 14(4), 98-105.—Describes

the experiences of a drug addiction treatment clinic in a hospital setting that involved the disciplines of social work, medicine, and psychiatry. The treatment modality is based on the assumption that to reject drugs a patient must: (a) develop substitute satisfactions to be found in work and personal relationships; (b) discover outlets for pent-up emotions; (c) develop techniques to cope with day-to-day problems; (d) expand his threshold of tolerance for suffering, persevering, and delaying gratification; and (e) develop a more aggressive and self-assertive attitude. To accomplish these aims, the program emphasized a work training program to provide job skills and eventual employment. It is stressed that "in the final analysis, success in treatment must be equated with improved functioning rather than total and complete abstinence."—M. Maney.

Alcoholism

2642. Bonabesse, M. **Quelques considérations sur l'aspect psychologique de l'alcoolisme et de son traitement.** [Some thoughts on the psychological aspect of alcoholism and its treatment.] *Information Psychologique*, 1968(Apr), No. 30, 3-35.—Reviews various theories about the causes of alcoholism and methods of treatment.—S. G. Vandenberg.

2643. Canter, Francis M. (Eastern Michigan U.) **Alcoholism, tension-increase and existence.** *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 75-78.—Describes the case of a patient who used alcohol to increase, rather than to decrease, tension. It is suggested that therapy for excessive drinkers should be directed to the sources of their tension and the "development of more constructive ways of dealing with them."—H. K. Moore.

2644. Cautela, Joseph R. (Boston Coll.) **The treatment of alcoholism by covert sensitization.** *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 83-90.—Describes the application of the covert sensitization procedure in the treatment of alcoholism. The patient is instructed to close his eyes and imagine that he is about to drink an alcoholic beverage, instead he experiences a sensation of nausea and vomits. Some problems in the use of the treatment are noted. (24 ref.)—H. K. Moore.

2645. Chess, Stephen B. (U. Kansas) **The relationship between arousal level and Rod and Frame Test performance.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5684.

2646. Marconi, Juan. **Barreras culturales en la comunicación que afectan el desarrollo de programas de control y prevención del alcoholismo.** [Cultural barriers in communication which affect the growth of programs for the control and prevention of alcoholism.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Dec), Vol. 15(4), 351-355.—Describes problems in reaching Chile's 3 cultural types—an educated middle class guided by scientific theory, a large working class guided by folk medicine, and the aborigines who practice a medicinal ritual. A survey showed alcoholism to be a large problem among the lower classes, particularly the aborigines. Existing programs for alcoholism at the National Health Service and the University of Chile are reviewed and suggestions are made for a more effective program. Suggestions include: (a) sectorization of the community; (b) computation and hierarchization of health objectives; (c) distribution of educational information about alcoholism; and (d) a

delegation of doctors, nurses, social aid organizations, and recuperated alcoholics in various communities.—P. Hertzberg.

2647. **Rosenberg, C. M.** (Boston City Hosp., Mass.) **Forearm blood flow in response to stress.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 180-184.—Examined the relationship between stress, forearm blood flow, and subjective anxiety. In 26 normal male Ss, electric shocks applied to the opposite forearm led to a rapid rise in anxiety and forearm blood flow. With repeated regular shocks, habituation of the vasomotor response occurred and anxiety became less intense. Changes appeared to be related to S's ability to predict accurately the intensity and frequency of the stimulus. Mental arithmetic under harassment produced a more gradual but greater rise in blood flow without an equal rise in anxiety. 23 alcoholic Ss who were judged to have limited motivation and ego strength showed a significantly lower vasomotor response during mental arithmetic. It is concluded that changes in forearm blood flow observed during stress cannot be related only to an increase in anxiety. This response seems to depend also on the significance of the stimulus to S, his psychiatric status, and his level of motivation. (19 ref.)—*Journal abstract*.

2648. **Simpson, R. Keith; Fitz, Erle; Scott, Bob, & Walker, Len.** (College Hosp., Des Moines, Ia.) **Delirium tremens: A preventable iatrogenic and environmental phenomenon.** *Journal of the American Osteopathic Association*, 1968(Oct), Vol. 68(2), 123-130.—Establishes a specific diagnostic criterion for the diagnosis of delirium tremens that considers the presence of tremor, hyperkinesia, diaphoresis, hallucinations, illusions, or mental confusion, and hyperthermia as essential requirements. The sequential development of these clinical phenomena is explored. It is believed that the classic expression of delirium tremens has been iatrogenic and environmental in origin. Of 1654 patients that were admitted to a treatment and rehabilitation center, none experienced a significant withdrawal phenomenon. Tremor, diaphoresis, tachycardia, elevated systolic and diastolic blood pressures, and hyperkinesia have been fleeting and uncomplicated, and hallucinations have been rare. The need for complete review of the current approach to the alcoholic patient in the acute phase of his disease is emphasized.—*Journal abstract*.

2649. **Spruell, Michael N.** (U. Georgia) **The development of facilitative training for a group of alcoholics.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5679.

2650. **Wanberg, Kenneth W.** (Ft. Logan Mental Health Center, Denver, Colo.) **Some psychodynamic dimensions found among alcoholics.** *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 79-85.—24 items from the Social History Questionnaire administered to 1891 alcoholics revealed 5 1st-order factors, viz, anxiety-depression, introversion-threat reactive, introversion-social isolation, social role stress-anxiety, and extraversion-coping. 2 broad psychodynamic dimensions resulted from the 5 primary factors, viz, severe stress and extraversion. Different treatment approaches might be established for the different dimensions.—H. K. Moore.

Suicide

2651. **DeSole, Daniel E., Singer, Phillip, & Aronson,**

Samuel. (Veterans Administration Hosp., Albany, N.Y.) **Suicide and role strain among physicians.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 294-301.—Uses data from Journal of the American Medical Association obituaries over a 3-yr period to report on an incidence of suicide among physicians and to identify the specialty in 278 of 291 cases, and presents 7 case histories for which data were obtained from interviews with physicians and paramedical professionals who knew the deceased as well as friends and relatives. The function of role strain in causing physician suicides is discussed. It is suggested that the amount of psychological role strain is greater for physicians than other professional groups since their ethical reach has become vastly extended without institutional supports to meet these extended demands. It is concluded "that without the opportunity for psychological regression and . . . institutional supports for his role as physician, the physician will continue to be more susceptible to role strain leading to depression and its resolution by suicide." (19 ref.)—M. Maney.

2652. **Ianzito, Benjamin M.** (Washington U., Medical School) **Attempted suicide by drug ingestion.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 453-458.—Characterizes the type of person who attempts suicide through drugs, and discusses "data concerning his management, diagnosis, and disposition." 95 cases of patients who were hospitalized for intentional overdoses of drugs were reviewed with respect to various parameters including age, sex, race, marital status, occupation, religion, major precipitating factors, intent, prior suicide attempts, past and present psychiatric care, type of medication used, and diagnosis on discharge. Results indicate that: (a) the majority of patients were females, including a high number in the nursing profession; (b) most attempts were gestures, although intent was difficult to determine; (c) 39% had made prior suicide attempts; (d) medication was usually of the sedative-hypnotic type; and (e) most cases had a prior psychiatric history.—P. McMillan.

2653. **Krauss, Herbert H.** (U. Georgia) **Social development and suicide.** *Journal of Cross-Cultural Psychology*, 1970(Jun), Vol. 1(2), 159-167.—Studied 58 societies to test the relationship between societal complexity and frequency of suicide. Suicide frequency was highest in the medium complexity cultures and lowest in the low complexity cultures. The highly complex cultures were divided between high and low suicide rates. "It is suggested that this result may eventually be understood in terms of the way in which societies bind their members into patterned social relations." (25 ref.)—A. Krichev.

2654. **Krieger, George.** (Veterans Administration Hosp., Palo Alto, Calif.) **Biochemical predictors of suicide.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 478-482.—Reports a follow-up study of 205 male psychiatric patients who were considered suicidal risks and for whom 24-hr urinary output of 17 hydroxycorticosteroids (17-OHCS), 17-OHCS/creatinine ratios, and 8:30 AM plasma cortisol levels were obtained. Within 1-29 mo. after the completion of the tests, 6 of these patients had suicided. While the 17-OHCS did not differentiate between suicides and nonsuicides, the 17 OHCS/creatinine ratio and plasma cortisol did so at a statistical significance of between .05 and .10. It is speculated that the elevated plasma cortisol may reflect

the vulnerability to suicide and be causative. (17 ref.)—*Journal summary.*

2655. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Adolescent suicide and premarital sexual behavior.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 131-132.—C. Kluckhohn's suggestion that adolescent suicide would occur more in societies where premarital sexual expression was severely punished was tested on a sample of 40 nonliterate societies. The hypothesis was not confirmed.—*Author abstract.*

2656. Lester, David & Brockopp, Gene W. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Chronic callers to a suicide prevention center.** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 246-250.—Compared 24 chronic callers to a suicide prevention center with 378 1-time callers on a number of variables including age, sex, children, marital status, race, living arrangement, presenting problems, suicidal history, and rated suicidal risk on the 1st call. It was found that the 2 groups were similar in general characteristics and that chronic callers were "just as likely to be suicidal risks as average callers" and less likely to be anonymous. Types of chronic callers included those who were (a) currently seeing a therapist, (b) seeking diverse treatment and used the center, (c) wished to ventilate their feelings, and (d) disturbed people, previously in treatment. Possible useful approaches to the chronic caller include limiting the call from the outset, keeping a list of chronic callers, and preformulating a plan to deal with their needs.—*P. McMillan.*

2657. Rotov, Michail. (Trenton State Hosp., N.J.) **Death by suicide in the hospital: An analysis of 20 therapeutic failures.** *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 216-227.—Probes the reasons surrounding 20 suicides drawn from 2 public mental hospitals. Offers a postfactum examination of the circumstances as they are reflected in patient's hospital records, examining: (a) therapeutic regime, (b) patient/doctor relationship, (c) adequacy of preventative measures, and (d) missed clues of suicidal intent. Curtailement of the seclusion of suicidal patients is suggested and the retention ECS by the hospital as a possible method of treatment for selected patients is recommended. "An important clue to a patient's hidden suicidal impulses is a projective concern over his relatives or his own well-being." Tic-like suicides (impulsive and frequently repetitive suicidal attempt) may reflect a state of chronic dissociation. Some of the physicians responsible for the cases presented were of either of 2 character types: "the benevolent, indecisive, meek physician ... [and] an aggressive, nihilistically oriented physician."—*P. R. Shibelski.*

2658. Wyrsh, Jakob. **Schuld und Verantwortung bei Suizid.** [Guilt and responsibility with suicidals.] *Praxis der Psychotherapie*, 1968(Dec), Vol. 13(6), 241-252.—Discusses the roles and responsibilities of the physician in relation to institutionalizing vs. not institutionalizing patients who verbalize suicidal fantasies or intentions.—*B. A. Stanton.*

Crime

2659. Amelang, Manfred & Rodel, Gerd. (U. Hamburg, Psychological Inst., W. Germany) **Persönli-**

chkeits- und Einstellungskorrelate krimineller Verhaltensweisen. [Personality and attitude correlates with criminal behavior.] *Psychologische Rundschau*, 1970(Jul), Vol. 21(3), 157-179.—Discusses methodological difficulties in correlating personality characteristics with criminal tendencies. Some of these difficulties have been avoided in studies with 2 groups of prisoners: one incarcerated for traffic violations, the other group for thievery, breaking and entering, etc. Correlations with intelligence and personality tests showed no significant difference between the 2 groups with respect to IQ and extraversion, highly significant differences with respect to neuroticism and tendencies to lie, and a significant difference with readiness to take risks. (47 ref.)—*W. J. Koppitz.*

2660. Gattshall, Gerald W. (Ball State U.) **Imprisonment's affects upon the self concept and the actualizing process.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5235.

2661. Mucchielli, R. (U. Nice, France) **La personnalité criminelle.** [The criminal personality.] *Information Psychologique*, 1968(Feb), No. 29, 25-36.—Reviews various theories of the criminal personality from psychiatric and sociological viewpoints.—*S. G. Vandenberg.*

2662. Orgler, Herta. **Adlerian psychology: A help in solving the current crime problem.** *Individual Psychologist*, 1969(Nov), Vol. 6(2), 25-28.—Training in Adlerian psychology would be helpful to those who work with criminals. The criminals need to acquire insight into and change "their erroneous concept of life by enlarging their social interest and by setting themselves a constructive goal and pursuing it."—*A. R. Howard.*

2663. Quarantelli, E. L. & Dynes, Russell R. (Ohio State U.) **Property norms and looting: Their patterns in community crises.** *Phylon*, 1970(Sum), Vol. 31(2), 168-182.—Examines various views of looting, and suggests that such behavior is a subcultural pattern not unlike other normative behavior, rather than an individual action. As such, it is conforming behavior rather than an expression of deviance.—*A. R. Howard.*

2664. Renear, Katherine R. (Claremont Graduate School, Calif.) **Field dependence and parole success.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5678.

2665. Witter, Herman. (26 Alleestr., Homburg/Sanddorf, W. Germany) **Die Verantwortlichkeit des neurotisch Gestörten aus der Sicht der Begutachtung.** [The responsibility of the neurotically disturbed from the viewpoint of judgment.] *Praxis der Psychotherapie*, 1968(Dec), Vol. 13(6), 264-274.—Presents 8 case histories to demonstrate neurotic symptomatology which precipitated disturbed judgment resulting in criminal behavior. Several aspects of criminal law in relation to legal and social rights of emotionally disturbed offenders are discussed.—*B. A. Stanton.*

Juvenile Delinquency

2666. Baer, Daniel J. (Boston Coll.) **Taxonomic classification of male delinquents from autobiographical data and subsequent recidivism.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 27-31.—From a taxonomic analysis of a 75-item Biographical Questionnaire administered to 60 male delinquents, 3 groups were identified. Although no significant association was found between taxonomic classification and subsequent recidivism, some trend was evident. The group lowest in

recidivism also had the lowest proportion of stubborn child-runaway offenders and the highest incidence of larceny-theft delinquents. Results suggest that the taxonomic analysis of autobiographical data may be a useful method of classifying youthful offenders.—*Journal summary.*

2667. Balaščík, Drahomír. *Některé zvláštnosti intelektové úrovně u mladistvých provinilců.* [Some curiosities of intellectual level in juvenile delinquents.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(1), 21-50.—Discusses the discrepancy between data found in the literature indicating that the frequency of mental deficiency found in juvenile delinquents ranges from 2-96% and that the mean IQ levels of delinquents have both normal and subnormal values. An attempt was made to determine (a) the average IQ of 258 juvenile delinquents, (b) factors which could explain a decrease in IQ, and (c) reasons for data discrepancy. Results indicate (a) an IQ range of 89-94, (b) an intellectual performance level lower than normal Ss, (c) that intellectual insufficiency in etiology and development of offensive behavior occurred more often in 15-17 yr. olds than in older Ss, and (d) the tendency to commit various offenses is not conditioned by IQ. It is suggested that discrepancies in data findings were due to differences in level of observation used in research, validity of diagnostic methods, and representativeness of variables studied. It is concluded that age, nationality, educational level, and professional training are the main factors influencing intellectual performance in delinquents. (Russian summary) (44 ref.)—*English summary.*

2668. Bednar, Richard L., Zelhart, Paul F., Great-house, Larry, & Weinberg, Steve. (U. Arkansas, Rehabilitation Research & Training Center) *Operant conditioning principles in the treatment of learning and behavior problems with delinquent boys.* *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 492-497.—Gave 32 12-18 yr. old delinquent boys 18 consecutive weekly lessons of programed reading instruction. Ss were randomly assigned either to a group reinforced with monetary tokens, or to a group that was nonreinforced. Analysis of variance with repeated measures was employed to analyze the data. Results indicate that both groups showed significant improvement in reading skill from pre- to posttesting, but that the reinforced group showed significantly more improvement than the nonreinforced group. Teacher ratings of general classroom behavior showed concomitant improvement for the reinforced group. Results are discussed in the context of applying conditioning principles to learning problems and the role of the counseling psychologist as a consultant to teaching personnel.—*Journal abstract.*

2669. Fitzgerald, Bernard J., Pasewark, R. A., & Noah, Sally J. (U. Wyoming) *Validity of Rotter's Interpersonal Trust Scale: A study of delinquent adolescents.* *Psychological Reports*, 1970(Feb), Vol. 26(1), 163-166.—As a partial test of the validity of Rotter's Interpersonal Trust Scale, the instrument was utilized to differentiate male (N = 51) and female (N = 41) delinquent groups from like-sized nondelinquent groups matched for age and social class. Since Rotter states that delinquents are less trusting of others, the use of such groups seemed a fair test of the discriminability of the scale, but no significant differences were found on the Interpersonal Trust Scale among these male and female delinquent groups and their nondelinquent counterparts.

Thus, the validity of the instrument as a measure of the trust variable is questioned.—*Journal abstract.*

2670. Schindler, Sepp. (111 Schönbrunner Str., Vienna, Austria) *Aggressives Verhalten Jugendlicher: Eine sozialpsychologische Studie.* [Aggressive behavior of juveniles: A sociopsychological study.] *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 169-181.—Investigated all 1072 14-18 yr. olds sentenced for intentional physical bodily injuries by an Austrian court in 1961. Various personalities, social situations, behavioral characteristics, and relations between the offender and the persons who incurred injuries were compared. (23 ref.)—*English summary.*

2671. Schindler, Sepp. (111 Schönbrunner Str., Vienna, Austria) *Kann der Vater ersetzt werden? Zur Genese und Therapie kriminellen Verhaltens männlicher Jugendlicher.* [Can the father be replaced? Genesis and therapy of criminal behavior of male adolescents.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 141-147.—Proposes that therapy can provide compensation for the lack or deficiency of a father figure in youth. Statistics of increasing criminal behavior in male Austrian youths from 1951-1960 are compared. The roots of this socially aberrant behavior are traced to a deficiency in the father figure during early childhood. The need for treatment following the 1st criminal offense is emphasized as a means of providing compensation for lack of an adequate father figure. It is concluded that psychotherapy can increase achievement of ego and role identifications and decrease patterns of criminal behavior in adults.—B. A. Stanton.

2672. Spinks, Nellie J. (Florida State U.) *The effects of male and female models in vicarious therapy pretraining on the change in self-concept of institutionalized female juvenile delinquents in group counseling.* *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5702-5703.

2673. Taylor, Leslie R. (Purdue U.) *Dimensions of delinquent behavior.* *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5680.

2674. Tennent, T. G. (Broadmoor Hosp., Crowthorne, England) *Truancy and stealing.* *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 587-592.—Compared a group of truants to a group of delinquents to investigate the hypothesis that truants show a greater degree of maladjustment. No significant differences were found between the groups in any background factors, except that the truants were more often the youngest members of their family. A rating method based on the psychiatrist's global clinical impression suggests more emotional disturbance in the truants, but this was not confirmed by 6 area scores extracted from probation officers' and social workers' reports.—R. L. Sulzer.

2675. Truax, Charles B., Wargo, Donald G., & Volksdorf, Norman R. (U. Calgary, Alberta, Canada) *Antecedents to outcome in group counseling with institutionalized juvenile delinquents: Effects of therapeutic conditions, patient self-exploration, alternate sessions, and vicarious therapy pretraining.* *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 235-242.—An alternate session regimen led to poorer outcome in 40 female and 40 male 14-18 yr. old juvenile delinquents; vicarious therapy pretraining and depth of self-exploration did not lead to different levels of outcome; but high levels of therapist conditions led to

significantly better outcome than did low levels. Results are compared with conflicting results obtained with adult hospitalized and out-patient groups. (21 ref.)—*Journal abstract*.

Homosexuality & Sexual Deviation

2676. **Bieber, Irving.** (New York U., Medical School) **Homosexuality.** *American Journal of Nursing*, 1969(Dec), Vol. 69(12), 2637-2641.—Presents a comprehensive discussion of the parental family structure conducive to the development of homosexuality. 106 male homosexuals were employed in the study. Approximately $\frac{1}{3}$ of these Ss in psychoanalytic treatment became exclusively heterosexual. Describes male and female homosexuality in stages from childhood to adulthood. Discusses degrees of involvement, bisexuality, life style of homosexuals, and the psychodynamics and treatment of homosexuals.—*B. A. Stanton*.

2677. **Dellaert, R. & Kunke, T.** (207B Italelei, Antwerp, Belgium) **Investigations on a case of male transsexualism.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(2), 89-107.—Presents an investigation of a case of transsexualism and describes progress achieved in psychotherapy via the cooperative efforts of a psychologist and a psychiatrist. The patient became obsessed with the idea of undergoing a surgical procedure to effect a change in sex when confronted with the prospect of marriage. Recovery ensued following a complete analysis of the negative and positive oedipus complex. Therapy results point to a psychogenic etiology of transsexualism.—*B. A. Stanton*.

2678. **Haynes, Stephen N.** (U. Oregon, Medical School) **Learning theory and the treatment of homosexuality.** *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 91-94.—The patient is punished for overt homosexual responses and gains gratification from heterosexual activity. (24 ref.)—*H. K. Moore*.

2679. **Imielński, K.** (Research Inst. Mother & Child Health, Warsaw, Poland) **Homosexuality in males with particular reference to marriage.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(2), 126-132.—Based on an investigation of 28 homosexual males who married, it is stated that marriage may be recommended to homosexual individuals with 1st, or at least 2nd degree homosexuality according to Kinsey's scale. If homosexuality has reached greater intensification and, according to this scale, must be rated under the 3rd or higher degrees, the patient should be under treatment before marrying. Marriage may be suggested after the 1st or 2nd degrees have been reached. The marriage of homosexual individuals with 3rd or higher degree of homosexuality proved to be not lasting and frequently even fictitious. Separation of the partners even for a short period of time is contraindicated as sexual abstinence may bring about a recurrence of sexual perversion. (20 ref.)—*Journal summary*.

MENTAL DISORDER

2680. ———. **Mental disease: Biochemical causes.** *Nature*, 1969(Sep), Vol. 223(5210), 999.—Reviews a World Health Organization report which demonstrates the adverse effects of the following deficiencies on the brain and mental functioning: iodine, protein, vitamin A, thiamine, riboflavin, and vitamin B₁₂.

It is pointed out that electrolyte imbalance may cause mania and depression. It is suggested that the only rational biochemical approach to the study of mental illness is through investigation of conditions with similar symptoms, i.e., drug-induced psychoses.—*B. A. Stanton*.

2681. **Balbana, Virginia M.** (U. Georgia) **Psychopathology and the problem of guilt.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5682-5683.

2682. **Burton-Bradley, B. G.** (Dept. of Public Health, Territory of Papua & New Guinea) **Transcultural psychiatry in Papua and New Guinea.** *Journal of Cross-Cultural Psychology*, 1970(Jun), Vol. 1(2), 177-183.—Suggests "strongly that Papua and New Guinea cultural factors have a distinct pathoplastic effect on individuals relative to mental disorder, and that further cross-cultural studies will do much toward the clarification of many issues. Even at this stage it seems fairly clear that cultural factors are not of primary aetiological importance in the causation of mental disorder in the same sense as the pneumococcus is in relation to pneumonia. That they are of considerable secondary importance is clear from the above. The cultural factors operate with and against a background of psychological, physiological, and genetic forces which interact with one another in the production of mental disorder." (17 ref.)—*A. Krichew*.

2683. **Cadoret, Remi J., Winokur, George, & Clayton, Paula J.** (Washington U., Medical School) **Family history studies: VII. Manic depressive disease versus depressive disease.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 625-635.—Analyzed data from 5 previous studies for risk of affective illness in parents, siblings, and children of patients who were grouped by age, sex, and bipolar vs. unipolar (no history of mania). Significant sex differences lead to the postulation of 2 groups of unipolar illness, in which males and females have equal morbid risks and in which the illness is sex-limited to females. Risks for bipolar patients' relatives are mainly consistent with the hypothesis of X-linked dominant inheritance, i.e., brothers of female patients showed a lower risk than sisters, but sons and daughters of female patients showed equal risks. (23 ref.)—*R. L. Sulzer*.

2684. **de Bonis, M.** **Anxietés pathologiques et anxiété normale: II. Comparaison de la structure factorielle des réponses à la M.A.S. de Taylor et une échelle de symptômes.** [Pathological anxiety and normal anxiety: II. Comparison of the factorial structure of responses to the Taylor MAS and to a Scale of Symptoms.] *Revue de Psychologie Appliquée*, 1970, Vol. 20(1), 1-25.—Factorial structure reveals neurotics are apparently more anxious than schizophrenics and both of these are more anxious than normal Ss. Tentatively, anxiety appears independent of depression in normal Ss. Further, a leading factor among the normals is an emotional reactivity which does not appear among the ill. Application of discriminate analysis techniques arrived at results very similar to those obtained by the Scale of Symptoms despite important differences of factorial content between the 2 tests. On the Scale of Symptoms, normal Ss' scores were nearer to those of neurotics than of schizophrenics. Though of an entirely different source, the anxiety of the schizophrenic shows numerous aspects in common with the anxiety of the neurotic and both of these more intense than the anxiety of normal Ss.—*K. J. Hartman*.

2685. Dreyfuss, F., Dasberg, H., & Assael, M. I. (Hebrew U., Hadassah Medical School, Jerusalem, Israel) **The relationship of myocardial infarction to depressive illness.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(2), 73-81.—In a 5-yr survey of the incidence of myocardial infarction among the 890 male and 1545 female patients hospitalized in a psychiatric hospital (1959-1963), 21 male and 8 female patients were found to have coronary artery disease manifested by myocardial infarcts. 26 of these patients (all over age 40) belonged to the depressive group of disorders whereas 60% of all patients in this age group were depressives. The other 3 infarct patients had predominately paranoid manifestations. Figures for 1964-1965 showed the same trend. 34 patients had myocardial infarctions and depressive disorders, while only 5 infarcts were seen in all other patients. (15 ref.)—*Journal summary.*

2686. El-Islam, M. Fakhr & El-Deeb, Hend A. (Cairo U. Hosp., Egypt) **The educational and occupational correlates of psychiatric disorder: A study at an Arab psychiatric clinic.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 288-293.—Compared the educational and occupational status of 508 male and 459 female psychiatric outpatients to that of 100 male and 100 female medical outpatients, used as a control group, to explore the general belief that the rising incidence of psychiatric disorder is a product of the changes brought about by civilization and industrialization. Male psychiatric Ss, especially cases of neurotic depression and anxiety states were educationally better than controls. This was true even after excluding the overrepresented group that had secondary school or university education whose overrepresentation was attributed to external factors related to the availability of private psychiatric services. Occupationally, both male and female psychiatric Ss (except schizophrenics) were better than controls. Selection by education and selection by occupation were discussed. The better educational and occupational status of psychiatric Ss as a whole group contrasted with the poor educational and occupational status of the schizophrenic subgroup. The relevant hypotheses explaining this phenomenon are discussed.—*Journal summary.*

2687. Erwin, C. William & Zung, William W. (Duke U., Medical School) **Behavioral and EEG criteria of sleep in humans: Comparison using radiotelemetry.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 375-377.—Compared behavioral and EEG criteria of the sleep of 13 psychiatric inpatients, using radiotelemetry for 18 nights. Nursing hospital personnel completed a routine sleep chart on Ss based on 1/2-hr observations using the following behavioral criteria: relaxed and regular respiration, sleeper still and eyes closed, snoring present, general posture in bed, effect of shining light near sleeper's face, and asking sleeper to give a signal if awake. Behavioral estimation of the wake-sleep states was in agreement with EEG criteria 93% of the time. The majority of errors (85%) occurred when Ss were scored as asleep behaviorally but were awake in Stage A by EEG. Approximately 1/3 of the bed-checks of Ss produced EEG arousals as evidenced by a shift in sleep stages. These were, however, transient and did not produce a significant number of awakenings.—*Journal summary.*

2688. Kostandov, E. A. (Serbskii Central Research Inst. of Forensic Psychiatry, Moscow, USSR) **Vliyaniye otritsatel'nykh emotsii na vospriyatiye u psikhopatov.** [Influence of negative emotions on perception in psy-

chopaths.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 225-235.—The 20-45 yr. old Ss included 22 excitable psychopaths, 10 psychopaths with ideas of superiority of nonpathological character, 6 psychopaths with paranoid development, and 22 normal individuals. It was shown that, under emotional excitation, part of the stimuli from the external environment, previously perceived, receded from awareness, but could nevertheless, act on the organism on the subsensory level. The influence of negative emotions on the processes of perception were more prolonged in psychopaths than in normal Ss. In psychopaths the threshold of recognition of "emotional" words, having to do with their conflictful life situation, could be decidedly lower or higher than that of "neutral" words. In cases of increased threshold of recognition, a subthreshold effect of the emotional word was recorded in the form of bioelectrical and autonomic reactions. The possible role of these changes in perception in the behavior of psychopathic personalities is discussed. (English summary) (39 ref.)—*I. D. London.*

2689. Lilienfeld, Diana M. (Metropolitan Hosp., New York, N.Y.) **Mental health information and moral values of lower class psychiatric clinic patients.** *International Journal of Social Psychiatry*, 1969(Fal), Vol. 15(4), 264-278.—A study of lower class psychiatric clinic patients found that their knowledge of mental illness and psychiatry, measured by scores on several mental health questionnaires, was significantly higher than the clinic's professional personnel expected it to be. The moral values professed by the patients were more authoritarian and repressed than those of the experts. There were no significant relationships found between mental health knowledge or moral values congruent with those of the experts and psychiatric impression rating, diagnosis, or disposition. (60 ref.)—*Journal summary.*

2690. Robinson, Ann E. & Wolkind, S. N. (London Hosp. Medical School, England) **Amphetamine abuse amongst psychiatric in-patients: The use of gas chromatography.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 643-644.—Analyzed urine samples of 54 acute psychiatric patients in an open ward to assess amphetamine abuse. Amphetamine derivatives were found in the urine of 22 Ss (15% of total ward population). Ss were compared with the total ward population for sex, age, and residence. There were more males, younger patients, and local residents in the group with positive urine samples. Clustering of positive results in 2 6-wk periods suggests the ease in which drugs are brought into and distributed within the hospital. The ability of patients to deny drug taking is noted.—*P. McMillan.*

2691. Rogovin, M. S. **Problema ékspresii i oë mesto v psikhopatologii.** [The problem of expression and its place in psychopathology.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jan), Vol. 70(1), 136-143.—Presents a survey of non-Soviet research which attempts to discern general tendencies in the development of various views in the area of expressiveness, and indicate the essential nature of the psychological mechanisms underlying expressive communication. General headings include: (a) expressive occurrences and intuitive knowing, (b) the problem of expression in historical perspective, and (c) features of the problem of expression and the concepts defining it. (68 ref.)—*I. D. London.*

2692. Schulman, William J. (U. Texas) **Personality and behavior characteristics of assaultive psychi-**

atric patients. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5698-5699.

2693. Shipman, William G., Heath, Helen A., & Oken, Donald. (Michael Reese Hosp. & Medical Center, Inst. for Psychosomatic & Psychiatric Research & Training, Chicago, Ill.) **Response specificity among muscular and autonomic variables.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 369-374.—Describes an experiment designed to discover whether there are personality characteristics unique to persons having dominant responsivity in a particular muscular system or in 1 of the autonomic variables monitored. Ss were 44 18-49 yr. old psychiatric clinic outpatients. Muscle tension and autonomic scores were obtained under 4 conditions: rest, white noise, recovery, and psychological stress (simulated danger). Data indicate that an S tended to respond to the various stimuli consistently with the same muscle. Analysis of the autonomic variables also revealed response specificity. When the 4 subgroups of sufficient size were studied, certain characteristics emerged. Ss with a tense frontalis tended to be older, married, and depressed. Those with a tense gastrocnemius tended to be young, single, hostile, dependent, and active. Those with high heart rates were married, disorganized, and had chronic (trait) anxiety. Those with higher levels of palm sweating were young, slow moving, used suppression to handle fear, and had little interest in the opposite sex. The relations between trait anxiety and activity level and those between heart rate vs. palmar conductance (sweating) seemed to merit further research.—*Journal summary*.

2694. Shipman, William G., Oken, Donald, & Heath, Helen A. (Michael Reese Hosp. & Medical Center, Inst. for Psychosomatic & Psychiatric Research & Training, Chicago, Ill.) **Muscle tension and effort at self-control during anxiety.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 359-368.—Hypothesized that effort at self-control accounts for the role of muscle tension during anxiety. 44 psychiatric outpatients were studied during periods of rest, white noise, and a contrived danger. Results indicate that the great increases in muscle tension and most autonomic functions during psychological stress were related to anxiety ratings and not to ratings of self-control. Personality variables were related significantly to some of the responses to white noise. Depressed Ss had a major increase in frontalis muscle tension, field-dependent Ss a major heart rate increase, and disorganized, impulse-ridden Ss the greatest increase in palmar skin conductance. (33 ref.)—*Journal summary*.

2695. Tolsma, F. J. (Rotterdam Mental Hosp., Poortugaal, Netherlands) **Doom expectancy from a psychopathological point of view.** *Psychiatria, Neurologia, Neurochirurgia*, 1968(Sep), Vol. 71(5), 435-446.—Presents a phenomenological analysis of doom expectancy. This is encountered in several psychiatric syndromes, and found interwoven in philosophical, political, and religious systems. The problem of temporalization and regionalization is discussed. It is concluded that excessive isolation can cause mental disturbances. The individual must therefore be protected from an excess of impressions while appropriate demands are made on him. The attraction which can be exerted on a patient or a group varies from case to case and from situation to situation, dependent on the degree of healthiness.—*Journal abstract*.

2696. Watzlawick, Paul. **Familia y patogenicidad.** [Fam-

ily and pathogenesis.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Dec), Vol. 15(4), 334-340.—Explores the therapeutic potentialities inherent in the familial system, emphasizing a departure from the monadic psychoanalytic approach to a more comprehensive one based on the concept that interpersonal relations influence mental health. The effect of intra-familial communication on psychiatric disorders is illustrated by 2 examples. The basic pathogenic factor in human systems is thought to be overly rigid rules of conduct. 3 hypotheses based on studies of families of schizophrenics, depressed Ss, and delinquents are proposed to show the relation between familial interaction and pathogenesis. (English summary)—P. Hertzberg.

Neurosis & Emotional Disorder

2697. Agulnik, Peter L. (Littlemore Hosp., Oxford, England) **The spouse of the phobic patient.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 59-67.—50 patients, mostly agoraphobic in type, completed the Cornell Medical Index (CMI) and Caine's Hysteroid-Obsessoid Questionnaire as did their spouses. Patients gave high CMI scores, but spouses got low scores not indicative of neurosis. Neither patients nor spouses showed predominantly obsessoid characters, and they seemed to rate each other as reliably as controls. Conflicting with previous work, neurotic manifestations in the spouse did not appear to develop progressively with increasing duration of marriage. There was, however, a correlation of scores in recently married couples. (24 ref.)—R. L. Sulzer.

2698. Bruch, Hilde. (Baylor U., Medical School, Houston, Tex.) **Changing approaches to anorexia nervosa.** *International Psychiatry Clinics*, 1970, Vol. 7(1), 3-24.

2699. Cohler, Bertram J., Weiss, Justin L., & Grunebaum, Henry U. (Harvard U.) **Child-care attitudes and emotional disturbance among mothers of young children.** *Genetic Psychology Monographs*, 1970(Aug), Vol. 82(1), 3-47.—Maladaptive attitudes regarding particular child-care issues may be a factor in the development of emotional disturbances in women during the 1st 3 yr. following childbirth. Results obtained using a paper-and-pencil measure (233-item Maternal Attitude Scale) based on issues to be negotiated between mother and child indicated that greater denial of child-rearing concerns and a belief in the unimportance of establishing reciprocity with a child distinguished the attitudes of mothers hospitalized during the 1st 3 yr. following childbirth (N = 35) as contrasted with a matched control sample (N = 35). Additional study of these hospitalized mothers indicated that poor pre-morbid social adjustment was related to less adaptive attitudes concerning the development of mother-child reciprocity and that conflict regarding the resolution of particular life issues at the time of hospitalization was associated with more maladaptive attitudes. (124 ref.)—*Author abstract*.

2700. Frank, Irving & Frank, Rosanne K. (Chicago Medical School, Ill.) **The management of the academic under-achiever in a family practice.** *Psychosomatics*, 1970(May), Vol. 11(3), 183-187.—Presents methods for better understanding the underachieving child in school by the family physician. Common problems encountered are school phobia and academic underachievement. The relationship of these problems to

faulty family interactions is reviewed. 3 case histories are summarized. It is concluded that the uniqueness of each child's personality and needs must be recognized and that the family physician can be an effective liaison between the parents, the school, and the child.—P. McMillan.

2701. Gifford, Sanford; Murawski, Benjamin J., & Pilot, Martin L. (Harvard Medical School, Boston, Mass.) **Anorexia nervosa in one of identical twins.** *International Psychiatry Clinics*, 1970, Vol. 7(1), 139-228.

2702. Kreitman, Norman; Collins, Joyce; Nelson, Barbara, & Troop, Jane. (U. Edinburgh, Scotland) **Neurosis and marital interaction: I. Personality and symptoms.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 33-46.—Investigated the effects of neurosis on the patient's marriage and marital partner through a group of 60 male outpatients by conjoint interviews and tests. Ss' wives differed from matched controls both in higher ratings of impaired health and in results of the Cornell Medical Index (CMI) and the MPI. M-R and total CMI were higher and the N scale of the MPI was elevated. Early in marriage the Ss' wives were similar to the controls, yet duration of marriage did not have a simple relation to health of Ss' wives due to the most disturbed husbands appearing with the shortest marriages. CMI data do show a trend to increased scores late in marriage, but this is not paralleled in the MPI data. (15 ref.)—R. L. Sulzer.

2703. Lewinsohn, P. M. & Shaw, D. A. (U. Oregon, Psychology Clinic) **Feedback about interpersonal behavior change: A case study in the treatment of depression.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(2), 82-88.—Describes the short-term intensive treatment of a 24-yr-old female with symptoms of depression, dysphoria, urinary tract dysfunction, and a mental preoccupation with a brain tumor. Treatment consisted of home observations with discussions of marital interactions. This effected a rapid cessation of the depression. At the same time it improved the interactions between spouses.—B. A. Stanton.

2704. Makhoul, Norris F., Jones, H. Gwynne, & Norris, Hugh. (North Middlesex Hosp., London, England) **Articulation of the conceptual structure in obsessional neurosis.** *British Journal of Social & Clinical Psychology*, 1970(Sep), Vol. 9(3), 264-274.—Describes a new method for the analysis of the organization of constructs in the cognitive structure based on the correlations between constructs. The method differentiated significantly between a neurotic group (11 obsessive-compulsive patients) and a normal control group (11 nonpsychiatric patients). The normal conceptual structure is articulated, comprising 2 or more relatively independent clusters joined by a linkage cluster. The obsessional conceptual structure is non-articulated, being typically monolithic or segmented.—Journal abstract.

2705. Nelson, Barbara; Collins, Joyce; Kreitman, Norman, & Troop, Jane. (Graylingwell Hosp., Chichester, England) **Neurosis and marital interaction: II. Time sharing and social activity.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 47-58.—A time-budget for a 1-wk period supported the hypotheses that patients (N = 60) and their wives spent more time in face-to-face contact than controls (N = 60), and spent less time as a couple in social intercourse with others. Wives of Ss spent less time in independent social activity than controls. An index of social integration gave lower

scores for Ss' wives, and all these differences were most marked for the long married. There is a progressive increase in social activity of normal wives as marriage progresses and a lack of such a progression in Ss' wives.—R. L. Sulzer.

2706. Rausch, Bernard. (32 Kaulbachstr., Nürnberg, W. Germany) **Der Gutachter zwischen Täter und Opfer: Bemerkungen aus der gerichtsärztlichen Praxis zur Begutachtung neurotisch gestörter Menschen.** [The assessor between culprit and victim: Observations from forensic practice concerning the judgment of neurotically disturbed individuals.] *Praxis der Psychotherapie*, 1968(Dec), Vol. 13(6), 275-283.—Discusses failures in judgment abilities of neurotic patients, and presents 8 cases to demonstrate the importance of legal consideration of situational factors which are frequently involved in hostile acts performed by neurotic individuals.—B. A. Stanton.

2707. Rowland, Christopher V. (Harvard Medical School, Boston, Mass.) **Anorexia nervosa: A survey of the literature and review of 30 cases.** *International Psychiatry Clinics*, 1970, Vol. 7(1), 37-137.

2708. Schapira, Kurt; Kerr, T. A., & Roth, Martin. (U. Newcastle upon Tyne, England) **Phobias and affective illness.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 25-32.—Principal components analyses on the phobias elicited retrospectively from 111 patients with affective illness showed a tendency for phobias to separate into monosymptomatic and agoraphobic clusters. The 1st class was relatively unaffected by illness, while social phobias and agoraphobias were frequently related to it. The presence of agoraphobic symptoms may indicate a liability to affective illness. Ss with anxiety states had significantly more phobias both before and during illness than Ss with depressive illness. A control group of nonpsychiatric patients matched for age and sex showed the same tendency for phobias to separate into monosymptomatic and agoraphobic clusters. (15 ref.)—R. L. Sulzer.

2709. Sedman, G. (St. Ann's Hosp., Poole, England) **Theories of depersonalization: A re-appraisal.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 1-14.—Reviews the literature to show that even in organic states, the incidence of depersonalization is generally constant and near that shown in normal populations. Some studies show no relationship between degree of torpor and development of depersonalization. Psychometric tests produce little evidence of a relationship between clouding of consciousness and depersonalization. There may then be a built-in mechanism in 40% of the population to exhibit depersonalization with precipitating factors not related to clouding of consciousness. Relations with depressive mood change, the role of anxiety, and theoretical views are discussed. (91 ref.)—R. L. Sulzer.

2710. Sharma, S. D., Shah, P. B., & Acharya, P. T. (Medical Coll., Baroda, India) **Urinary 17-hydroxycorticosteroids levels and urine electrolytes in depression.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 343-347.—Studied plasma and urinary electrolytes and urinary 17-hydroxycorticosteroids (17-OHCS) levels (an index of anterior pituitary adrenal cortical activity), and their possible relationship in 8 24-60 yr. old normals, 10 endogenous and 3 neurotic 18-65 yr. old depression cases. It was found that there was sodium and chloride depletion in plasma and an increased excretion of these electrolytes in the endog-

enous depression and neurotic groups when compared to controls. The urinary excretions of 17-OHCS was lower in the endogenous group. This low level of 17-OHCS in urine was supported by increased excretion of sodium and chloride levels, and was possibly due to associated milieu factors of the ward. There were no significant changes as regards the plasma and urine electrolytes like potassium, bicarbonates, calcium and phosphorus. (16 ref.)—*Journal summary*.

2711. **Taschman, George.** (City Coll., City U. New York) **Historical antecedents in hysteric reading disability.** *Graduate Research in Education & Related Disciplines*, 1968(Win), Vol. 4(1), 3-24.—Examined "whether... the background of the defined hysteric child with reading disability includes self-absorbed, significant persons, from whom this child has 'learned' self absorption." 20 parents of children with retarded reading levels served as Ss. The hypotheses that Ss would be more successful than controls in detecting absurdities and that controls would better understand proverbs were supported.—*G. Steele*.

Psychosis

2712. **Colbach, Edward M. & Crowe, Raymond R.** **Marihuana associated psychosis in Vietnam.** *Military Medicine*, 1970(Jul), Vol. 135(7), 571-574.—Using a case study approach a psychotic syndrome subsequent to marihuana smoking has been found in approximately 10% of men hospitalized for psychiatric reasons in Vietnam. This syndrome is marked by time disorientation, recent memory loss, paranoid ideation, and occasionally auditory and visual hallucinations. These symptoms last up to 10 days after admission to the hospital. Affected individuals are characterized by a borderline personality organization.—*G. A. Chum*.

2713. **Frosch, J.** **Psychoanalytic considerations of the psychotic character.** *Journal of the American Psychoanalytic Association*, 1970(Jan), Vol. 18(1), 24-50.—The psychotic character establishes a reality-syntonic adaptation and may never show psychosis. Although the psychotic character shows fragmentation, projective identification, ego splitting, etc., these phenomena show a transient quality and can be reversed. Object relations are at a higher infantile level than in psychosis. The ego is threatened by breakthroughs of id-derived impulses but the psychotic character can reverse these phenomena. In contrast to the psychotic, the psychotic character shows a push toward differentiation and maturation derived via identification with reality-oriented love objects. The main goals of therapy with the psychotic character are encouraging differentiation, establishing feelings of identity, and facilitating the development of mature reality testing and reality constancy. (21 ref.)—*D. Prager*.

2714. **Gastager, Helmo.** (79 Ignaz-Harrer Str., Salzburg, Austria) **Frührehabilitation und Spätrehabilitation von Psychosen.** [Early and late rehabilitation of psychoses.] *Nervenarzt*, 1968(Oct), Vol. 39(10), 456-459.—The early rehabilitation of 146 male and 277 female institutionalized, psychotic patients using intensive psychotherapy, recreational therapy, occupational therapy, and music therapy proved to be successful in all but 11 cases. 5 of these were mentally retarded and 2 were alcoholics. It is emphasized that although late rehabilitation can be accomplished, most patients who have been institutionalized for many yr. have lost

motivation and have resigned to the "institutional personality," thereby making therapy more difficult and success less likely.—*B. A. Stanton*.

2715. **Levine, David & Wittenborn, J. Richard.** (U. Nebraska) **Relation of expressed attitudes to improvement in functional psychotics.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 275-277.—Correlated the attitudes of 120 mental hospital patients toward themselves, their future, symptoms and hospitalization with 6 measures of improvement. It was found that Ss' attitudes were relevant for predicting the outcome of their mental disorder.—*Journal abstract*.

2716. **Meyer, A.** (Singel 50, Amsterdam, Netherlands) **Supersition and magic in the Caribbean: Some psychiatric consequences: Preliminary investigation.** *Psychiatria, Neurologia, Neurochirurgia*, 1968(Sep), Vol. 71(5), 421-434.—Presents examples of magical and superstitious beliefs in the Caribbean area. The similarity of these beliefs in these culturally, linguistically, and socioeconomically often so different territories is striking. Magic and supersition influence, in a far higher degree than is mostly assumed, not only inter-human relations but the thought-content and behavior pattern of the individual as well. They form a psychic disposition that could be described as compulsive-paranoic. An attempt is made to propose a theory which could explain the extremely high incidence of paranoid reactions among psychotics as a result of these superstitious beliefs, however, it is concluded that further exploration in this field and especially of its impact on mental health, is prerequisite. (44 ref.)—*Journal abstract*.

2717. **Müller-Hegemann, D.** (Wilhelm Griesinger Hosp., Berlin, E. Germany) **Sexuelle Auffälligkeiten bei Psychosen.** [Sexual abnormalities of psychotics.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Apr), Vol. 22(4), 137-140.—Presents data on the frequency of abnormal sexual behavior, length of medical history, and age groups of 6 categories of 593 psychotics.—*K. J. Hartman*.

2718. **Pethő, B. & Takács, L.** (Medical School, Budapest, Hungary) **Über die nosologische Stellung und Differentialdiagnostik der phasischen und psychoorganischen Psychosen.** [On the nosological position and differential diagnosis of phasic and psycho-organic psychoses.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Apr), Vol. 22(4), 146-150.—Stresses the need for more systematic classification of psychoses. Endorsed is the cerebropathologically oriented psychiatric school of thought of Wernicke, Kleist, and Leonhard. (29 ref.)—*K. J. Hartman*.

2719. **Schneider, Stanley E.** (U. Maryland) **The effects of work and counseling on chronic psychiatric patients with differing levels of ego strength.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5697-5698.

2720. **Zysman, Samuel; Volnovich, J. C., Tischkovsky Palant, J., & Wajzman de Steinbaum, N.** **Rasgos psicóticos: Justificación de este diagnóstico en psicopatología infantil.** [Psychotic traits: A diagnostic entity useful in child psychopathology.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Dec), Vol. 15(4), 348-350.—Describes psychotic traits in children as an alternation of neurotic behavior which appears to be related to persecution anxiety that cannot be adequately controlled by the ego. A clinical picture of these traits is described from the observation of play situations. Important prognostic factors include S's (a) age, (b)

family situation, (c) conflicting situations at onset of illness, and (d) areas of expression. (English summary)
—P. Hertzberg.

Schizophrenia

2721. Bashina, V. M. (Inst. of Psychiatry, Moscow, USSR) **Nekotorye dannye kliniko-genealogicheskogo izucheniya semei detei zabollevshikh vyalotekushchei shizofreniei v doskol'nom vozraste.** [Some data from a clinicogenealogical study of the families of preschool children suffering from sluggishly proceeding schizophrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 246-251.—Studied the families of 13 boys and 3 girls (5-8 yr.). Among the 236 relatives and members of the immediate family, 74 disclosed the following: 15 with manifest, rudimentary, and attenuated forms of schizophrenia; 52 with schizoid traits; 6 with schizothymic traits; and 1 with psychasthenic traits. Despite the unselective character of the study, "processual and postprocessual pathologies and anomalies of character" were uncovered in all families in both parental lines. Special attenuated forms of the schizophrenic process, as well as a distinctive psychopathic development, were detected. (English summary)
—I. D. London.

2722. Broadhurst, Anne. (U. Birmingham, England) **Time estimation related to personality, cognitive speed and schizophrenia.** *Life Sciences*, 1969(Jan), Vol. 8(2, Pt. 2), 69-78.—24 normal and 24 chronic schizophrenic males estimated duration of elapsed time at 2 simple motor tasks. Personality and cognitive correlates of these estimates were calculated. Cognitive speed was related to time estimation only in the normal group. As predicted from H. J. Eysenck's work, there is a positive relationship between time estimation and extraversion. (25 ref.)—*Journal abstract.*

2723. Flarer, Franco; Genovese, Carmelo, & Borsari, Raffaele. (U. Ferrara, Italy) **Rilevati statistici sull'attività grafica di psicotici il grafo-analizzatore GAD I.** [A statistical survey of the plotted activity of psychotics.] *La Ricerca Scientifica*, 1968(Jan), Vol. 38(1), 63-70.—Examines the execution of a drawing by soldiers, trained and untrained in drawing, and schizophrenics working under identical conditions. A technique of analysis of the choices made by individuals of certain fundamental graphic signs was employed. An electronic apparatus, GAD I, a digital grapho-analyzer, was devised to give special attention to the time factor and to make possible the study of psychomotor mechanisms and deviation of the groups. Suggestions for the wider use GAD I are made.—*English abstract.*

2724. Frith, Uta. (MRC Developmental Psychology Unit, London, England) **Studies in pattern detection in normal and autistic children: II. Reproduction and production of color sequences.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 120-135.—10 5-6 yr. old normal and 10 7-15 yr. old autistic children of comparable performance level built rows of colors according to predetermined binary patterns. Most errors made by normal Ss were in accordance with the dominant feature of the patterns. Most errors made by autistic Ss were due to the imposition of simple perseveration or alternation strings independent of the given patterns. Similar imposition tendencies were found in the spontaneous production of binary sequences by normal and autistic Ss. It is concluded that autistic Ss are

insensitive to differences in the structures present and tend to impose their own simple stereotyped patterns, while normal Ss impose such patterns in absence of structured input only. This is consistent with the hypothesis of an input processing deficit in autistic children.—*Journal abstract.*

2725. Golovan, L. I. (Inst. of Psychiatry, Moscow, USSR) **Roditeli detei, bol'nykh vyalotekushchei shizofreniei.** [Parents of children suffering from sluggishly proceeding schizophrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 242-246.—The 50 parents of 25 schizophrenics (psychosis of the sluggish progressive type, starting in early childhood or puberty) were observed in a clinicogenealogical study to determine the types of anomalies of character most frequently encountered in the parents of schizophrenic children. Manifest forms of schizophrenia were observed in 7 parents (5 with attacklike schizophrenia; 2 following a sluggish course); attenuated ambulatory forms of schizophrenia in 18 parents. In several of them psychotic episodes were observed with affective, neurotic, and psychotiform symptomatology; in others (mostly fathers) changes in character predominated in the direction of autism, emotional impoverishment, psychopathization, and a decline of mental activity. 25 parents exhibited anomalies of character, capable of analysis within the frames of "constitutional psychopathies." (English summary)—I. D. London.

2726. Gordon, Robert B. (Indiana U.) **Thought disorder in schizophrenia.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5688.

2727. Heath, Robert G., Guschwan, Andrew F., & Coffey, John W. (Tulane U., Medical School) **Relation of taraxein to schizophrenia.** *Diseases of the Nervous System*, 1970(Jun), Vol. 31(6), 391-395.—Attempted to define more clearly the relation of schizophrenia to taraxein, a protein fraction from serum of schizophrenics. Serum from 38 severely disturbed schizophrenic patients and 18 controls (6 healthy medical students and 12 patients with other diseases) was given by intraventricular and iv injections to rhesus monkeys with implanted cortical electrodes during EEG recordings. Psychosis-inducing (taraxein) activity was observed at least once and usually repeatedly in serum fractions from 30 of the schizophrenic donors. Fractions were inert from all but 1 of the controls. Data suggest that "taraxein is present in all subtypes of acutely ill schizophrenic patients and that it induces aberrations in brain activity and consequent behavioral signs and symptoms of the disease." However, the many variables involved make it impossible yet to conclude from this study that "schizophrenia is probably a single disease entity."—P. McMillan.

2728. Johnson, George R., Martin, Patrick L., & Vogler, Roger E. (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) **Prediction of rehospitalization of family-care patients using the MMPI.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 273-274.—Peterson's scale, derived from the MMPI, was not predictive of rehospitalization for 40 schizophrenic patients preparing to leave the hospital.—*Journal abstract.*

2729. Kaplan, Helen S., et al. (New York Medical Coll., N.Y.) **Post-gastrectomy pain and schizophrenia.** *Psychosomatics*, 1970(May), Vol. 11(3), 157-163.—Found that 10 postgastrectomy patients who continued to complain of abdominal pain in the absence of demonstrable organic pathology showed a high inci-

dence of schizophrenia. This observation led to the development of 2 hypotheses: (a) postgastrectomy pain (PGP) is a psychopathological defense mechanism, considered to be a perceptual symptom (i.e., essentially a hallucinatory phenomenon, which is usually a manifestation of schizophrenia); and (b) PGP persists as a hallucinatory phenomenon in the schizophrenic because it is positively reinforced by alleviating anxiety and providing rewards. It is concluded that PGP, and perhaps various other intractable medical complaints, may represent still another of the many manifestations of schizophrenia.—*Journal summary.*

2730. Keup, Wolfram; Seto, Thomas A., & Gonda, Otto. (Brooklyn State Hosp., N.Y.) **Non-specificity of the "gray" spot (indole derivative) in the urine of schizophrenics.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 476-478.—Found that the "gray" spot claimed by G. L. Mattok, P. O. O'Reilly, and R. T. Hughes (see PA, Vol. 41:14001) to be a characteristic substance in the urine of schizophrenic patients, and appeared almost as frequently in the urine of 45 normal controls as in that of 68 schizophrenics. The amount of this substance fluctuated widely in a longitudinal study with 7 of the schizophrenics and 4 normals. It was found that the excretion of this factor was greatly increased with the ingestion of bananas.—*Journal summary.*

2732. Lane, Ellen A. & Albee, George W. (Case Western Reserve U.) **Correlations between the IQs of schizophrenic parents and their children.** *Psychological Record*, 1970(Win), Vol. 20(1), 81-82.—Obtained correlations between the IQs of 81 children of schizophrenics and the childhood IQs of their parents ($N = 47$). No relationship was found between the IQs of children and those of their schizophrenic parents but a significant and normal correlation was found between the IQ scores of these children and those of their nonschizophrenic parents. It is concluded that the lack of correlation between the IQs of children and their schizophrenic parents was due to the erratic test performance of schizophrenics, occurring long before the recognized onset of their disorder, rather than that of their children.—*Journal abstract.*

2733. Lupandin, V. M. & Stoyanov, St. (Inst. of Psychiatry, Moscow, USSR) **Parafrennye sostoyaniya pri remittiruyushchei shizofrenii u podrostkov.** [Paraphrenic states in remittent schizophrenia in adolescence.] *Zhurnal Nevropatologii i Psikhiatrii*, 1970, Vol. 70(2), 256-261.—50 adolescents with remittent schizophrenia (onset at 8-16 yr.), characterized by paraphrenic states, were observed. These states were not seen earlier than the age of 13 yr. While these states in adolescents shared the same general psychopathological structure and development seen in adults, there were a number of distinguishing features. Despite polymorphism, the fantasy delusions of adolescents were more rudimentary in character than in adults. At the same time, sensory disorders were displayed more clearly. Another essential feature of paraphrenic attacks in adolescence was the marked character of the catatonic disorders which frequently masked other psychopathological displays. 3 groups were distinguished: (a) where the course of the psychosis is intermittent (14); (b) where the appearance or intensification of negative symptoms follows an attack

(20); and (c) where a continuous course of the schizophrenia, featured by a paranoid syndrome, preceded the remittent course of the psychosis (16). There were differences among these 3 groups with respect to the interconnection of fantasy delusion and other disorders. In Group 1, fantasy delusion developed in close connection with a special state of consciousness; in Group 2, with affective disturbances; and in Group 3, primarily with instances of mental automatism. (English summary)—*J. D. London.*

2734. Mellor, C. S. (U. Dept. of Psychiatry, Manchester, England) **First rank symptoms of schizophrenia: I. The frequency in schizophrenics on admission to hospital. II. Differences between individual first rank symptoms.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 15-23.—Of 166 schizophrenic admissions to the hospital, 119 had "1st rank symptoms" as defined by K. Schneider. Those lacking 1st rank symptoms had been ill longer and had more admissions. Differences between individual 1st rank symptoms in associations with other symptoms and patients' sex, age of onset, number of admissions, and family history tabulated for 173 patients show a number of significant intercorrelations. These symptoms did not relate to the conventional subcategories of schizophrenia. (17 ref.)—*R. L. Sulzer.*

2735. Mishler, Elliot G. & Waxler, Nancy E. (Harvard Medical School, Boston, Mass.) **Functions of hesitations in the speech on normal families and families of schizophrenic patients.** *Language & Speech*, 1970(Apr), Vol. 13(2), 102-117.—Sampled sentences containing several types of hesitation, from the interaction of families of schizophrenic and normal children. These were submitted to 35 paid volunteer undergraduates who attempted to guess each successive word in the sentence. The degree to which words were correctly guessed was associated with the position of the word relative to the hesitation in the sentence. Differences were found in the predictability of words antecedent and subsequent to noncontent and content hesitations. The patterns of predictability were different for words from the 2 types of families; words following noncontent hesitations in schizophrenic families dropped to low levels of predictability, 18%, in contrast to a 36% level of predictability for the same type of word in normal families. Findings are discussed in terms of the possible different functions of hesitations in schizophrenic and normal families, and related to clinical reports of difficulty in comprehending conversations among schizophrenic family members. (15 ref.)—*Journal abstract.*

2736. Ornitz, Edward M. (U. California, Medical School, Los Angeles) **REM sleep and the autistic child.** *International Psychiatry Clinics*, 1970, Vol. 7(2), 112-117.

2737. Payne, Robert W., Hochberg, Arthur C., & Hawks, David V. (Temple U., Eastern Pennsylvania Psychiatric Inst.) **Dichotic stimulation as a method of assessing disorder of attention in overinclusive schizophrenic patients.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 185-193.—Gave matched groups of 12 clinically overinclusive schizophrenics, 12 nonoverinclusive schizophrenics, and 12 normals Payne and Friedlander's standard battery of tests of overinclusive thinking. They also took part in 2 experiments in which they repeated verbal material presented through 1 earphone, while distracted through the other. Tests of

overinclusive thinking intercorrelated significantly, as did the perceptual overinclusion scores derived from the amount of distracting material repeated. Overinclusive thinking did not correlate significantly with overinclusive perception, contrary to the hypothesis that both are due to some defective central filtering mechanism. Measures of both sorts of overinclusion discriminated significantly between the 2 schizophrenic groups, probably because the clinical definition of overinclusion included both thinking and perceptual distractibility. (29 ref.)—*Journal abstract.*

2738. Salzinger, Kurt; Portnoy, Stephanie; Pisoni, David B., & Feldman, Richard S. (New York State Dept. of Mental Hygiene, Biometrics Research, New York) **The immediacy hypothesis and response-produced stimuli in schizophrenic speech.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 258-264.—Compared speech samples emitted by 10 schizophrenics individually matched with 10 normals and used them to test the validity of the immediacy hypothesis, which states that schizophrenics are primarily controlled by the immediate aspects of their environment, whether response-produced or external. The cloze responses of 230 undergraduates to the verbal samples indicated that schizophrenic speech consists of relatively short strings of words related to one another, while in normal speech the dependency of 1 word on another holds over longer spans. Results are interpreted to mean that schizophrenics have a greater tendency than normals to be controlled by immediate stimuli (in this case, response-produced), thus providing further evidence for the immediacy hypothesis. (20 ref.)—*Journal abstract.*

2739. Shashkova, I. A. (Inst. of Psychiatry, Moscow, USSR) **Shizofreniya s psikhopatopodobnymi proyavleniyami u detei i podrostkov.** [Schizophrenia with psychopathoid manifestations in children and adolescents.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 251-256.—Studied: (a) the clinical features of child and adolescent schizophrenia, proceeding with psychopathoid manifestations; (b) the dynamic features of these disturbances; and (c) their connection with the course of the psychosis. 40 boys and 10 girls (7-15 yr.) were observed, 30 of whom displayed a continuous course of schizophrenia; 20 an attacklike-progressive course. Psychopathoid manifestations (especially heboid) were noted in both courses, preceded by the presence of certain traits before the onset of the psychosis. Emotional disorders were prevalent along with autism, disturbed behavioral drives, and social maladaptation; gross decline of mental ability was not observed despite the early onset of the psychosis. Social adaptation of these schizophrenics and their learning abilities depended on the degree of the psychopathoid manifestations expressed and not on the reduction of mental capacity. (English summary)—*I. D. London.*

2740. Siegel, E. & Heidrich, R. (Academy of Medicine, Erfurt, E. Germany) **Beziehungen zwischen pneumoencephalographischen und psychopathologischen Befunden bei Schizophrenie.** [Relations between pneumoencephalographic and psychopathological findings in schizophrenia.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Apr), Vol. 22(4), 132-137.—Reports pathological abnormalities in 334 of 381 pneumoencephalograms of schizophrenic patients during a 10-yr study in the authors' clinic. The cause of these morphological conditions is not known. (42 ref.)—*K. J. Hartman.*

2741. Silvert, Diane M. (Michigan State U.) **Cortical arousal in Russian paranoid schizophrenics as a function of a word association task.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5699-5700.

2742. Sonnenberg, Stephen M. & Miller, Jean B. (St. Elizabeth's Hosp., Washington, D.C.) **Depression in resolving schizophrenia.** *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 111-117.—5 randomly-selected patients showed significant depression during recovery from schizophrenia. This may be a common, maybe inevitable, occurrence. Recognition of and attention to the wish for autonomy, along with fear of its consequences, seems central to resolution of the depressive state through psychotherapy. Depression of this sort may be related to early experiences of the patient with symbiotic relationships. Prognostically, depression is neither a good nor bad sign. The relationship between the 2 major forms of severe mental disturbance, schizophrenia and depression is questioned.—*H. K. Moore.*

2743. Strauss, Milton E. (U. Missouri, St. Louis) **Thematic content and trials effects in the size estimation of meaningful stimuli.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 276-278.—Studies of size estimation have reported some inconsistent differences in responses to Harris' thematic stimuli in various subgroups of acute schizophrenics. To determine whether these inconsistencies might be due to the confounding of thematic content and sequence in these studies, a Latin-square design was employed with 36 male undergraduates. A significant Thematic Content \times Trials interaction suggested that (a) inconsistencies in previous studies may reflect a Schizophrenic Subgroup \times Thematic Content \times Trials effect, and (b) currently available data do not permit the unambiguous assessment of the role of thematic content in schizophrenics' size estimations.—*Journal abstract.*

2744. Suchotliff, Leonard C. (Fairfield Hills Hosp., Newton, Conn.) **Relation of formal thought disorder to the communication deficit in schizophrenics.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 250-257.—Evaluated 40 schizophrenics and 20 normals on a social communication task and on an individual cognitive task, both designed to reveal decentering deficits. It was hypothesized that the processes underlying the schizophrenic's thought disorder are formally similar to the processes involved in his deviant organization of social situations, specifically social communication, with both deficits to be interpreted in terms of faulty decentering. Schizophrenics manifested a decentering deficit on both the social communication ($p < .005$) and individual cognitive tasks ($p < .001$). The positive correlation between performance on these tasks within the schizophrenic group ($p < .025$) support the hypothesis. (17 ref.)—*Journal abstract.*

2745. Tolor, Alexander. (Fairfield U., Inst. for Human Development) **Fallacy of schizophrenic deficit in the interpersonal sphere.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 278-282.—Tested 24 process schizophrenics and 49 normal males for psychological distance by means of a modification of Kuehne's social schemata technique. Although the patients were generally older and less intelligent than the normals, neither of these variables was related to distance measures. Both groups of Ss underestimated the distances in relation to the standard. Schizophrenics

consistently replaced the designs, neutral as well as social, closer together than normals. Instead of indicating a psychological deficit in the area of interpersonal relationships, findings suggest that schizophrenics have a strong desire to associate with others. The possible relationship between hospital atmosphere and psychological distance is discussed. (31 ref.)—*Journal abstract.*

2746. Wolman, Benjamin B. (7 W. 96th St., New York, N.Y.) **Childhood schizophrenia or vectoriasis praecocissima.** *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 264-277.—An attempt was made to compare childhood schizophrenia (vectoriasis praecocissima) with adult schizophrenia considering 2 major points: (a) the schizophrenic child is a child and not an adult and should be viewed in this manner, and (b) adult schizophrenia has its roots in the schizophrenic childhood. It was also pointed out that unlike adult schizophrenia which is a downward ego adjustment, in child schizophrenia the ego has not yet had a chance to develop and so remains dormant through the usual maturation period. 4 syndromes of child schizophrenia are noted in order of decreasing severity: (a) the pseudoamative (child ego crushed at preverbal stage creating severe retardation), (b) the autistic, (c) the symbiotic (child develops an unusually strong attachment and dependency on mother), and (d) the aretic (mildest form which resembles paranoid schizophrenia in adults). (32 ref.)—P. R. Shibelski.

Schizophrenia Treatment

2747. Bloom, Joseph B. & Davis, Norman. (Veterans Administration Neuropsychiatric Hosp., Pittsburgh, Pa.) **Changes in liver disturbance associated with long-term tranquilizing medication: A follow-up study.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 309-317.—Reports a follow-up survey of 20 male schizophrenics who had been biopsied 3-3½ yr. earlier because of reported liver histopathology. Case summaries of the 11 Ss who were available for rebiopsy are presented, including clinical history, report of liver morphology and histopathology, type and quantity of psychotropic drugs consumed, liver profile abnormalities, and an interpretation of the serum paper electrophoretic patterns of these 11 Ss, 3 showed a worsening, 3 improvement, and 5 no change. All Ss remained asymptomatic and anicteric. Results indicate difficulty in isolating the causative agent or agents producing changes in the liver.—P. McMillan.

2748. Giovacchini, Peter L. **The influence of interpretation upon schizophrenic patients.** *International Journal of Psycho-Analysis*, 1969(Apr), Vol. 50(2), 179-186.—Interpretation is "a communication between analyst and patient... and is not simply a disembodied stream of words." Psychoanalysis depends on using interpretation in the transference situation. It can be in "depth" or "surface." It can get into the defensive superstructure or into the underlying conflicts. It is stated that schizophrenics can be made aware of the reasons or causes of their irrationality. A linking interpretation which correlates the external world event and the patient's behavior is described.—J. Chyatte.

2749. Goldberg, Harold L., DiMascio, Alberto, & Chaudhary, Basudeo. (Boston State Hosp., West-Ros-Park Mental Health Center, Mass.) **A clinical evaluation of prolixin enanthate.** *Psychosomatics*, 1970(May), Vol. 11(3), 173-177.—Investigated the effec-

tiveness of parenteral long-acting fluphenazine (prolixin enanthate) on schizophrenic patients who were known by their histories to be reluctant to take oral medication. Ss were randomly assigned to 2 groups, with 19 scheduled for oral phenothiazine (controls) and 26 for injections of prolixin enanthate. Duration of treatment was 6 mo. or less, depending on S's condition. Evaluations included rating scales, medical and psychiatric history, laboratory tests, and clinical observations. Side effects, controlled by antiparkinson drugs, included readily reversible extrapyramidal symptoms (i.e., pseudoparkinsonism, dystonia, dyskinesia, and akathisia), transient drowsiness, hypersalivation, and alterations in blood pressure. Results indicate that prolixin enanthate is significantly superior to oral phenothiazine in drug-reluctant Ss, particularly in paranoid cases, and those living at home, who would otherwise require hospitalization.—P. McMillan.

2750. Pons Bartrán, Ricardo. (Preventorio Psiquiátrico Municipal de Barcelona, Spain) **Ensayo del neuroleptico Imagan (TPN-12) en un contingente de enfermos esquizofrénicos.** [A test of the neuroleptic drug imagan (TPN-12) in a group of schizophrenics.] *Revista de Psiquiatria y Psicología Médica*, 1969(Jan), Vol. 9(1), 42-50.—A meleril derivative, 2-methylsulfo nyl-10-(12)-(N-methyl piperidyl-2"-ethyl-1") phenothiazine, was tested in a group of 56 schizophrenics classified as acute type with psychomotor excitement, intermittent type, and chronic type with poor prognosis. A 300-mg dosage was administered to the 1st 2 groups, 600 mg. to the 3rd group. In the 1st group the drug reduced psychomotor activity as well as other symptoms in 17 of the 25 cases. In the 2nd group remission of symptoms was very rapid, and 14 of the 15 patients were cured. 6 of them, however, relapsed after 2 mo. In the 3rd group, the effect was moderate; improvement was noted in about 2/3 of the 16 patients. The symptoms showing fastest remission were agitation, lack of appetite, and insomnia. Positive effects on anxiety and sociability were also observed. There were no significant side effects.—L. Zusne.

2751. Weingaertner, Arthur H. (U. Southern California) **The effects of self shock procedure on hallucinatory activity in hospitalized schizophrenics.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5704-5705.

PSYCHOSOMATIC DISORDER

2752. Baltruch, Hans. (International & Cross-Cultural Leukemia Project, Oldenburg, W. Germany) **Einige psychosomatische Aspekte der Krebskrankheit unter Berücksichtigung psychotherapeutischer Gesichtspunkte.** [Several psychosomatic aspects of cancer with consideration of psychotherapeutic aspects.] *Zeitschrift für psychosomatische Medizin und Psychoanalyse*, 1969(Jan), Vol. 15(1), 31-36.—Based on collective investigations of a total of 3200 patients having various forms of carcinomas, the following were deemed characteristic psychological manifestations of patients with cancer: (a) disturbances in object relations; (b) dissatisfaction, aggression, and hostility; (c) depression; and (d) feelings of hopelessness. Psychoanalytic investigations of cancer patients demonstrate that most patients have an amnesic history of very high dependency needs and parental attachment and arrested psychosexual development. 79 out of 100 investigated patients with

malignancies had a history of neurotic or psychosomatic disturbances prior to the development of their malignancies. The palliative benefits of psychotherapy with these patients are discussed.—*B. A. Stanton.*

2753. **Gol'dman, N. B., Matlina, E. Sh., & Fets, A. N.** **Ékskretsiya adrenalina, noradrenalina i lkh predshestvennikov (dofa i dofamina) u bol'nykh migren'yu.** [Excretion of adrenaline, noradrenaline and their predecessors (DOPA and dopamine) in migraine sufferers.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970, Vol. 70(2), 199-203.—Studied diurnal urinary excretion of adrenaline, noradrenaline, dopamine, and DOPA (dihydroxyphenylalanine) in the intercritical period, during crisis, and during insulin administration. Results are based on data derived from 2 male and 23 female sufferers of migraine (19 were 55 yr. of age; duration of condition, 1-43 yr.) and from normal controls. No significant differences in the excretion of these substances were observed in the intercritical period; only a decrease in the noradrenaline-adrenaline excretion ratio was shown. In the precrisis period, a decrease in adrenaline excretion was noted. In the crucial period of the crisis, adrenaline excretion mounted significantly. If, during insulin administration, a migraine attack occurred, there was an increase in adrenaline secretion beyond that seen in normal persons. It is suggested that change in adrenaline level plays a certain role in the development of a migraine attack. (English summary)—*I. D. London.*

2754. **Hagedorn, E.** (U. Freiburg, W. Germany) **Psychosomatische Aspekte bei Funktionsstörungen und Erkrankungen der Leber.** [Psychosomatic aspects in functional disturbances and diseases of the liver.] *Zeitschrift für psychosomatische Medizin und Psychoanalyse*, 1969(Jan), Vol. 15(1), 1-31.—Reviews the literature concerning investigation of correlations between psychosomatic factors and liver pathology. Studies are cited concerning the effects of anger and anxiety on biliary excretion. Parasympathetic stimulation results in increased secretion of bile, whereas sympathetic stimulation results in inhibition of biliary secretion. Liver glycogen changes were also reported following selective sympathetic and parasympathetic stimulation of hypothalamic regions in animals. Articles are cited which concern correlations between anxiety and hippuric acid excretion, psychological factors in icterus, and the posthepatitis syndrome. (129 ref.)—*B. A. Stanton.*

2755. **Lefer, Leon.** (350 Central Park W., N.Y.) **The patient with temperomandibular joint pain-dysfunction syndrome** *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 69-89.—25 patients with a temperomandibular joint dysfunction syndrome (pain in jaws, temperomandibular joint, eye and/or ear, spasm of jaw and/or neck muscles, difficulty in opening the mouth) were requested to seek psychiatric consultation following a workup by a dental specialist which had shown no demonstrable organic pathology. Ss provided evidence of severe and acute problems in living. The jaw symptoms served primary and secondary goals. Symptomatology became acute when the S who was most passive in his emotional relationship with a single important person was forced by life changes to activity in the search for another important dependency relationship. Speculations were made to explain the localization of symptoms in the mouth and jaws. Clenching and jaw spasm were seen to be aids in the search for a sense of identity. (German summary)—*Journal summary.*

2756. **Morse, Robert M.** (Mayo Clinic & Mayo Foundation, Section of Psychiatry, Rochester, Minn.) **Postoperative delirium: A syndrome of multiple causation.** *Psychosomatics*, 1970(May), Vol. 11(3), 164-168.—Compared psychosocial factors in 117 postoperative patients, 60 showing delirium (defined as disturbed orientation), and 57 controls matched for age, sex, and type of operation. Comparison on 14 psychosocial items revealed a significantly higher incidence of preoperative fear of death, alcoholism, and depression among the delirious Ss. It is concluded that delirium, so defined, is a psychosomatic condition encompassing both biologic and psychologic variables.—*P. McMillan.*

2757. **Schwidder, Werner.** (Niedersächsisches Landeskrankenhaus, Göttingen/Tiefenbrunn, W. Germany) **Psychoanalyse und psychosomatische Medizin: Neue Ergebnisse und heutiger Stand der Forschung.** [Psychoanalysis and psychosomatic medicine: New results and the present state of research.] *Fortschritte der Psychoanalyse: Internationales Jahrbuch zur Weiterentwicklung der Psychoanalyse*, 1968, Vol. 3(3), 11-29.—Emphasizes the significance of psychoanalysis for the development of the various psychosomatic conceptions, in particular, for the interpretations of the etiology of psychosomatic disturbances. The continuous development of psychoanalytical basic positions as well as the inclusion of experimental, clinical, and psychological results of research has entailed a differentiation of the original psychosomatic model of Freud (conversion—narcissistic neurosis). Current experiences concerning the problem of the specificity and nonspecificity of psychosomatic illnesses are discussed. (72 ref.)—*English summary.*

2758. **Shanon, Jacob.** (Hadassah University Hosp., Psychosomatic Skin Clinic, Jerusalem, Israel) **The subconscious motivation for the appearance of psychosomatic skin disorders in concentration camp survivors and their rehabilitation.** *Psychosomatics*, 1970(May), Vol. 11(3), 178-182.—Discusses psychosomatic skin disorders in 128 survivors of concentration camps, classifying them as conflictogenic or stressogenic. Conflictogenic cases included pruritus, neurodermatitis, and concentration camp syndrome, and were linked to real or imaginary feelings of guilt. Stressogenic cases, particularly urticaria, were prompted by feelings of shame and injured self-esteem. Methods of rehabilitation emphasize reestablishing basic trust, emotional desensitization, reeducation toward reality, vocational counseling, and guidance in matters of family mental hygiene. A case history of a conflictogenic patient is included.—*P. McMillan.*

2759. **Steinhardt, Milton J.** (Grace Hosp., Detroit, Mich.) **Modes of therapy in emotional aspects of respiratory dysfunction.** *Psychosomatics*, 1970(May), Vol. 11(3), 169-172.—Presents 5 case summaries illustrating diagnostic issues and management problems of patients with asthmatic and similar breathing difficulties. The cases are used to indicate whether a patient should be referred to an internist or to a specialist (i.e., allergist or psychiatrist). It is concluded that the selection of therapist and mode of treatment are determined by the particular psychological mechanisms found in each case. (15 ref.)—*P. McMillan.*

CASE HISTORY

2760. **Aleksandrowicz, Jerzy; Klimek, Rudolf, & Ryn,**

Zdzisław. (Medical Academy, Psychiatric Clinic, Cracow, Poland) **A case of manic-depressive psychosis with 14-day cycles: Psychopathologic and endocrinologic observations.** *Polish Endocrinology*, 1968, Vol. 19(5-6), 280-284.

2761. **Arons, Barbara; Kosek, Jon C., & Forrest, Irene S.** (Stanford U., Medical School) **Chlorpromazine therapy in a female albino mental patient: Clinical, histochemical and biochemical observations.** *Life Sciences*, 1968(Dec), Vol. 7(24, Pt. 2), 1273-1280.—While it was previously demonstrated that chlorpromazine and melanin interact in vitro and in vivo, the effect of virtual absence of peripherally circulating melanoprotein in a 26-yr-old female true albino mental patient was unknown. Neither chlorpromazine metabolism as reflected by urinary drug excretion, nor the efficacy of chlorpromazine therapy were found affected. S showed clinical improvement beyond her previous level after 4 mo. of therapy with 800 mg/day chlorpromazine. S's urinary drug excretion pattern was entirely normal, both qualitatively and quantitatively. (18 ref.)—*Journal summary.*

2762. **Aronson, Stanley M. & Aronson, Betty E.** (State U. New York, Downstate Medical Center, Brooklyn) **Clinical neuropathological conference.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 348-354.—Presents the case of a 6½ yr. old boy hospitalized with complaints of progressive unsteadiness of gait, dizziness, headache, and double vision, beginning several wk. before admission. The patient was also noted to be lethargic and unable to swallow. In a discussion of the clinical aspects of the case by 2 physicians, a diagnosis of an inoperable infiltrating glioma of the brainstem was suggested. In a discussion of the pathological aspects of the case after autopsy, the final anatomical diagnosis was malignant pontine astrocytoma, Grade IV, with extension to medulla, right basal ganglia, thalamus and subarachnoid space.—*P. McMillan.*

2763. **Aronson, Stanley M. & Aronson, Betty E.** (Miriam Hosp., Providence, R.I.) **Clinical neuropathological conference.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 497-503.—Presents the case of a 48-yr-old Negro man, with a long-standing history of osteomyelitis, who was admitted to the hospital because of the recent development of seizures, confusion, swelling of the right elbow, and the presence of draining sinuses from his right shoulder. In a discussion of the clinical aspects of the case by 3 physicians, a diagnosis of cerebral abscess and chronic tertiary syphilis was suggested. An intracerebral gumma was also suggested as a rare possibility. The report of the pathologist after autopsy revealed the presence of a large granuloma within the left cerebral hemisphere. "The gross and histologic character of the granuloma suggested that it was a syphilitic gumma."—*P. McMillan.*

2764. **Boer, A. P. & Sipprelle, C. N.** (U. South Dakota) **Induced anxiety in the treatment of LSD effects.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(2), 108-113.—Describes a patient who following ingestion of LSD, displayed a variety of symptoms usually considered to be effects of that drug. Functional analysis of the case indicates the effects were really displaced manifestations of anxiety triggered by anxiety over separation from the family which was being bound by an avoidance response to LSD. Behavior therapy designed to reduce the displaced anxiety motivating the avoidance response was effective in removing the symptoms.—*Journal abstract.*

2765. **Constantinidis, J.** (U. Geneva, Psychiatric Clinic, Switzerland) **Ostéome intrathalamique.** [Intrathalamic osteoma.] *Psychiatria et Neurologia*, 1967, Vol. 154(6), 366-372.—Reports on the anatomoclinical observation of a woman who had suffered over a long period from specific motor disabilities, difficulties of coordination, and of left-side sensitivity. As a result of softening of the left occiput, the S developed a right hemianopsia, an acute confusional state, and marked signs of left thalamic and cerebellar disturbance. Radiography and a macroscopic examination of the brain after death at 74 yr. confirmed the presence of a calcified mass in the right posterior thalamus. Microscopic examination showed that this calcified mass, which was encased in a fibrous sheath, contained a bony formation with characteristic trabeculae and numerous osteoblasts. The literature has not revealed any other case of intrathalamic osteoma. Intrathalamic calcifications are very rare and only 3 cases were found in the literature. 1 of these was studied histologically and no bony formations were found. The pathogenesis of these calcified and ossified masses is not always clear. An inflammatory process, an abscess, a hematoma, a chance hyperplasia, or an embryonic malformation may be the cause.—*English summary.*

2766. **Cripps, Jean H., Tuites, Ann, & Blocklinger, Nancy.** (Hockessin Friends Preschool, Del.) **The re-education of a pampered prince.** *Individual Psychologist*, 1969(Nov), Vol. 6(2), 29-33.—Describes the modification of a preschool child's behavior according to Adlerian principles. The outcome is seen as a function of home and school cooperation.—*A. R. Howard.*

2767. **Donner, Gail.** **The treatment of a delusional patient.** *American Journal of Nursing*, 1969(Dec), Vol. 69(12), 2642-2644.—Repressed material must be examined prior to appropriate intervention with delusional patients. The correlation between delusional content and therapeutic intervention in a 20-yr-old female schizophrenic patient is described. The subject of whether the patient's dependency needs should be met with frustration, gratification, or investigation is discussed.—*B. A. Stanton.*

2768. **Drake, William E.** (Veterans Administration Hosp., San Francisco, Calif.) **Clinical and pathological findings in a child with a developmental learning disability.** *Journal of Learning Disabilities*, 1968(Sep), Vol. 1(9), 486-502.—Presents the case history and results of a neuropathological examination of a child with a relatively mild developmental learning disability who died unexpectedly. It is presented from an interdisciplinary approach involving various professional efforts and evolutionary thoughts.

2769. **Espin Montañez, José & Iranzo Prieto, Vicente.** **Un caso prurito anal de origen psíquico.** [A case of anal itching of psychological origin.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Jul), Vol. 28(3), 184-191.—Presents the clinical history of a 30-yr-old male who suffered anal itching from age 14 and failed to respond to local and general medication. Psychiatric analysis revealed that the itching was caused by neurotic somatization. The S showed (a) a fixation for infantile satisfactions, (b) rigid defenses of morbidity and religiosity, and (c) characteristics of self-punishment. Psychotherapy effected successful removal of the itching symptoms. (English summary)—*P. Hertzberg.*

2770. **Greene, Robert J., Hoats, David L., & Hornick, Adelbert J.** (Edward R. Johnstone Training & Research

Center, Bordentown, N.J.) **Music distortion: A new technique for behavior modification.** *Psychological Record*, 1970(Win), Vol. 20(1), 107-109.—Distorted music was made contingent upon disruptive rocking behavior of a blind, retarded S using an escape-avoidance design. Conditioning, extinction, reconditioning, and intermittent reinforcement procedures demonstrate the aversiveness of music distortion.—*Journal abstract*.

2771. **Hahn, Peter.** (U. Heidelberg, Ludolf Krehl Klinik, W. Germany) **Symptom und Erlebnisgeschichte.** [Symptoms and history of experiences.] *Praxis der Psychotherapie*, 1969(Jan), Vol. 14(1), 10-17.—Presents a case history of a 62-yr-old female with atrial sclerosis and a depressive-phobic state accompanied by a severe anxiety neurosis. The connection between clinical symptoms and subjective history of experiences in reference to symptom formation and neurotic structure is illustrated.—*B. A. Stanton*.

2772. **Hersen, Michel.** (Fairfield Hills Hosp., Newtown, Conn.) **The use of behavior modification techniques within a traditional psychotherapeutic context.** *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 308-313.—Presents a case history to support the contention that techniques and approaches in psychotherapy should be applied in terms of the particular problems and needs of the patient. A 26-yr-old female presented surface symptoms of anxiety and depression with underlying compulsive symptomatology. After 1 yr. of psychoanalytic therapy, the symptoms were magnified. However, following behavior modification, traditional treatment was once again employed with positive results. Flexibility of technique was further emphasized, as continued use of a particular technique with theoretical bias can be detrimental to the patient.—*P. R. Shibleski*.

2773. **Ingvar, David H. & Sourander, Patrick.** (U. Goteborg, Sweden) **Destruction of the reticular core of the brain stem: A patho-anatomical follow-up of a case of coma of three years' duration.** *Archives of Neurology*, 1970(Jul), Vol. 23(1), 1-8.—Severe lesion of the rostral reticular formation, associated with consciousness disturbances, was revealed in an adult male. Symptoms can be well-explained by long-term study of the topography of the lesion, involving the rostral part of the reticular core, with destruction almost complete at the level of the mesencephalon and rostral pons. Secondary brain lesions revealed, over time, distinct neuronal changes in the cerebral cortex that support the view that loss of a small volume of critical brain tissue leads to global functional depression of the brain, progressive in character. (28 ref.)—*S. E. Gavin*.

2774. **Jelinek, V. M. & Garson, O. Margaret.** (U. Melbourne, Victoria, Australia) **A case of adult male pseudohermaphroditism: The problems of diagnosis and treatment.** *Medical Journal of Australia*, 1969(Jul), Vol. 2(3), 150-151.—Describes a 28-yr-old male with genital ambiguity. Clinical findings suggested that S was either a male pseudohermaphrodite or, less likely, a true hermaphrodite. Cytogenetic and endocrinological investigations failed to differentiate with certainty between the 2 diagnoses. As the S's main problems were psychosocial, laparotomy and androgen therapy were thought to be contraindicated, and no active treatment for the intersex state was instituted. (17 ref.)—*Journal abstract*.

2775. **Kaesler, A. C., Rodnight, R., & Ellis, B. A.**

(Runwell Hosp., Essex, England) **Psychiatric and biochemical aspects of a case of homocystinuria.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1969(Apr), Vol. 32(2), 88-93.—Describes a homocystinuric adult with minor mental defect suffering from a psychosis and other psychiatric disorders. Treatment with pyridoxine resulted in a marked lowering of the plasma and urinary levels of homocystine but no change was demonstrated in his ability to metabolize a methionine load. Findings are discussed in relation to their etiological implications for psychosis and enzyme function. (21 ref.)—*Journal summary*.

2776. **Kahrweg, A. & Schmidt, J.** (Ruhr U., Neurologische Klinik, W. Germany) **Akute Chininvergiftung mit transitorischer Erblindung und Schwerhörigkeit (Suicidversuch).** [Acute quinine poisoning with transitory loss of sight and hearing (suicide investigation).] *Nervenarzt*, 1968(Oct), Vol. 39(10), 478-480.—Describes the means by which the correct diagnosis of attempted suicide was arrived at in the case of a 26-yr-old male who had ingested 3-5 gm. of quinine in conjunction with a large quantity of ethanol. Presenting symptoms included CNS disturbances in the form of headache, nausea, tinnitus, loss of hearing, blindness, and optic atrophy. In 3-4 wk., all symptoms subsided. It is concluded that quinine exerts a direct toxic effect on retinal ganglion cells. (17 ref.)—*B. A. Stanton*.

2777. **Keddie, Kenneth M.** (Sunnyside Royal Hosp., Montrose, England) **Hereditary ataxia, presumed to be of the Menzel type complicated by paranoid psychosis, in a mother and two sons.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1969(Apr), Vol. 32(2), 82-87.—Describes the case histories of 2 brothers suffering from Menzel type of hereditary ataxia. A paranoid psychotic illness affected each S before the neurological disturbance became manifest. In the elder S the psychosis was present for 12 yr. before the ataxia manifested itself and has persisted for a further 6 yr. The younger S was paranoid for only 5 yr. before his ataxia became obvious 3 yr. ago. The psychosis in this case remitted temporarily under the influence of drugs. The mother of the Ss also had ataxia for the last 15 yr. of her life. The responsible pathology is probably the same as in the case of her sons. The probability is even greater in view of the fact that she suffered from a paranoid psychosis for the last 23 yr. of her life. All Ss showed the common factors of ataxia, paranoid psychosis, and alcoholism. The relationship between those syndromes is discussed.—*Journal summary*.

2778. **Kimura, Bin.** [A family case with induced invocatory psychosis: I. Psychiatric study.] *Japanese Journal of Clinical Psychology*, 1968(Jul), Vol. 7(2), 107-114.

2779. **Kohlberg, Irving J. & Rothenberg, Michael B.** (U. Washington, Medical School) **Comprehensive care following multiple, life-threatening injuries.** *American Journal of Diseases of Children*, 1970, Vol. 119(5), 449-451.—Presents a case report demonstrating typical psychological reactions occurring in an adolescent boy with multiple, severe, permanent disabilities. Methods of dealing with such a patient are described which simultaneously are therapeutic and preventive of future psychological problems.—*A. B. Warren*.

2780. **Korganova, L. M.** (Municipal Hosp. No. 1, Rostov-on-Don, USSR) **Smeshannaya forma boleznii Recklinghausena.** [A mixed form of Recklinghausen's disease.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol.

70(2), 216-218.—Presents the rare case of neurofibromatosis, representing a mixed form of Recklinghausen's disease. Detailed histological study of the neurofibromata involved appears to confirm the view that the neurinomata in Recklinghausen's disease are hamartomatous in nature. (English summary)—*I. D. London.*

2781. Kraft, T. B. **Ein fall akuter paranoider psychose durch persuasion sofort genesen.** [A case of acute paranoid schizophrenic psychosis which showed improvement following persuasion therapy.] *Psychiatria, Neurologia, Neurochirurgia*, 1968(Sep), Vol. 71(5), 399-408.—Presents the history of a 42-yr-old female physiotherapist who developed a paranoid hallucinative psychosis following treatment by a homeopath. After a 1½-hr consultation with a psychiatrist it seemed possible to cure her completely by strong persuasion. No relapse has occurred during 2 yr. and the S could discuss her past condition objectively. F. Labhardt's short schizophrenia-like emotional psychosis is considered the most likely diagnosis. It is noted that such treatment is normally fruitless in psychoses. (German summary) (16 ref.)—*English summary.*

2782. Maier, William J. (3411 N. 5th Ave., Phoenix, Ariz.) **Sensory deprlrvn therapy of an autistic boy.** *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 228-245.—Describes the process of treatment of a 5-yr-old psychotic boy whose disability resembled L. Kanner's infantile autism syndrome. Common features of the syndrome are: (a) extreme aloneness, (b) failure to assume an anticipatory posture when picked up, (c) failure to use language to communicate, (d) obsessive desire for a status quo, (e) fascination with objects that can be handled, (f) skill in fine motor movement, and (g) good cognitive potential. It was hoped that the isolation experience would lead to: (a) "regression loosening of the child's defense stabilization, (b) alternating periods of successful defensive reestablishment, and (c) ... a significant personality reorganization." The child was placed in a small barren, dimly lit room for a period of some 74 days. During this time, he was fed and visited twice daily by a therapist at irregular times. The resulting effect was a significant improvement of the boy's ability to relate to other people and adapt to his environment. (16 ref.)—*P. R. Shibelski.*

2783. Melgar, Ramón & Goldar, Juan C. **Sobre las amnesias por lesiones límbicas: A propósito de un caso.** [On amnesia by limbic lesions: Regarding one case.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Dec), Vol. 15(4), 341-347.—Describes the syndrome of a 57-yr-old male with amnesia in regard to recent events, spatial and temporal disorientation, and faulty recognition. S was diagnosed as having circumscribed cerebral atrophy (atypical Pick's disease) with temporolimbic localization. Literature relating to disturbances of the limbic circuit and their effect on memory is discussed. (English summary) (22 ref.)—*P. Hertzberg.*

2784. Merry, Julius & Gompels, B. M. (St. Thomas's Hosp., London, England) **Miliary tuberculosis, tuberculosis of ribs and heroin addiction.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 645-646.—Presents a case history which illustrates an uncommon form of blood-disseminated infection complicating drug dependence. Blood-borne infections are common complications of drug self-administration because drug addicts are notorious for disregard of elementary hygienic

precautions. A needle cleaned by licking it can spread tuberculosis.—*R. L. Sulzer.*

2785. Oesterreich, Klaus. (U. Heidelberg, Psychiatrische & Neurologische Klinik, W. Germany) **Über den Einfluss von Sexualhormonen auf den Verlauf einer Psychose.** [The influence of sex hormones on the progression of a psychosis.] *Nervenarzt*, 1968(Oct), Vol. 39(10), 481-482.—Presents the case history of a 34-yr-old female having endogenous depression with strong paranoid anxiety components. Following unsuccessful treatment with melleril (thioridazine) and tofranil (imipramine), it was noted that the S's depression coincided with her menstrual cycle. Estrogen therapy was instigated to which the S responded favorably. The possibility of an endocrinological etiology of psychoses is suggested and briefly discussed.—*B. A. Stanton.*

2786. Ozaydin, S. & Nassi, G. **Un cas de narcolepsie associée au syndrome de Kilyaditi: Sa comparaison avec le syndrome de Pickwick.** [A case of narcolepsy associated with Kilyaditi's syndrome: Comparison with the Pickwick syndrome.] *Encéphale*, 1970(Jan), Vol. 59(1), 56-66.—Reports a clinical study of narcolepsy in a 65-yr-old man with rapid mental deterioration. He developed an uncompensated respiratory acidosis as determined by arterial blood gases. X ray revealed the interposition of colon between the right diaphragm and the liver—an anomaly known as Kitayditi's syndrome. Hypercapnia due to hypoventilation was attributed to diaphragmatic dysfunction. Resemblance to the Pickwick syndrome is discussed. (22 ref.)—*W. W. Meissner.*

2787. Pattison, E. Mansell. (U. Washington, Medical School) **The patient after psychotherapy.** *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 194-215.—Examines the psychodynamic changes which occurred during a 30-mo posttherapy period in a 30-yr-old female patient, originally diagnosed as having symptoms of spasmodic torticollis which, after approximately 1 yr. of psychotherapy, had disappeared. Through mail correspondence, the therapist and patient continued their relationship. A gradual shift from a therapeutic relationship to one of a human sharing relationship resulted which was also accompanied by a degree of generalization of the acquired coping skills on the part of the patient. Thus, she extended her therapeutic relationship to others in her new environment. Conclusions drawn point to a definite value in continued communication with the posttherapeutic patient in 3 areas: (a) development of a meaningful human relationship, (b) collection of psychotherapy research data, and (c) development of a therapeutic tool for the patient. (47 ref.)—*P. R. Shibelski.*

2788. Poser, Charles M., Huntley, Carolyn J., & Poland, Jack D. (U. Vermont, Coll. of Medicine) **Para-encephalitic parkinsonism.** *Acta Neurologica Scandinavica*, 1969, Vol. 45(2), 199-215.—Observed a case of severe transient parkinsonian syndrome following a meningoencephalitis associated with the coxsackie virus type B2 in a 16-yr-old boy. The onset of the clinical syndrome occurred immediately following the acute meningoencephalitis and lasted in its severest form for approximately 12 days. 8 mo. after the acute illness the only residual consisted of very mild cogwheel rigidity at the elbow joints which was confirmed by EMG reciprocal innervation studies. 15 mo. later, S had returned to his premorbid state. The validity of the concept under which postencephalitic parkinsonism is said to follow

only von Economo's encephalitis lethargica and the advisability of differentiating postencephalitic parkinsonism from the other 2 clinical types, idiopathic and arteriosclerotic, are questioned. It is hypothesized that all parkinsonism is viral in origin, and that the damage to the cells of the basal ganglia results from viral meningoencephalitis. The parkinsonism syndrome may become manifest later as the result of a secondary noxious situation, bringing into play the phenomenon of pathoclosis within the CNS. (30 ref.)—*Journal summary.*

2789. Reinhardt, G., Geldmacher, J. H., & Geldmacher-von Mallinckrodt, M. (U. Erlangen-Nürnberg, W. Germany) *Zur Toxizität von Noveril.* [Noveril toxicity.] *Nervenarzt*, 1968(Oct), Vol. 39(10), 473-476.—Discusses pathological and anatomical findings on autopsy of 2 patients who had successfully committed suicide via ingestion of an overdose of noveril (dibenzepin). It is suggested that when long-term treatment with tricyclic antidepressants is advisable, only small quantities of drugs be given to patients at 1 time to minimize ingestion of overdoses.—*B. A. Stanton.*

2790. Savitt, R. A. *Transference, somatization, and symbiotic need.* *Journal of the American Psychoanalytic Association*, 1969(Oct), Vol. 17(4), 1030-1054.—Presents a case report showing recurrence of peptic ulcer in the course of analysis. Environmental and predispositional factors combined to cause the original peptic ulcer and were also responsible for the recurrences. This analysis furthered understanding of the psychosomatic process and its resolution, particularly as it may refer to peptic ulcer. (18 ref.)—*D. Prager.*

2791. Stam, F. C., Wigboldus, J. M., & Grosveld, F. M. (Free U., Valerius Clinic, Amsterdam, Netherlands) *A peculiar type of presenile dementia.* *Psychiatria, Neurologia, Neurochirurgia*, 1968(Jul), Vol. 71(4), 337-350.—Describes a case of presenile dementia in a 56-yr-old male which showed a high degree of clinical similarity to subacute spongiform encephalopathy. However, the neuropathological findings proved to be of an entirely different type. The characteristic finding was the presence of disseminated racemose deposits of sialomucoproteins in the grey substance of the cerebrum, in the basal ganglia, and in the cerebellum. (28 ref.)—*Journal summary.*

2792. Tets, I. S., Perevoshchikova, G. F., & Smirnova, N. A. (Bekhterev Psychoneurological Inst., Leningrad, USSR) *K voprosu o sootnosheniyakh osobennostei kliniki i morfologicheskikh izmenenii mozga pri propul'sivnoi forme épilepsii.* [On the interrelationships of features of the clinical picture and those of morphological changes in the brain in the propulsive form of epilepsy.] *Zhurnal Nevropatologii i Psikhiatrii*, 1970(Jan), Vol. 70(1), 115-122.—Reports results of a clinico-anatomical study of 1 case of propulsive epilepsy with lethal outcome. This form of epilepsy is 1 of the varieties of dysontogeny. Cerebral malformations, providing the morphological basis of the disease, occur in early embryogenesis. Harmful peri- and postnatal factors complete the process whereby propulsive epilepsy eventuates. Characteristic of this form of epilepsy are (a) mental immaturity connected, obviously, with organic insufficiency of the brain at several levels, i.e., cerebellar, brainstem, subcortical ganglia, and cortex (especially in the speech zones of the motor and temporal cortex); and (b) acute cerebral ataxia accompanied by speech disorders.—*I. D. London.*

2793. Unger, L., Brunecker, G., & Drietomsky, E.

(Städtischen Krankenhaus für Psychiatrie und Neurologie Herzberge, Berlin, E. Germany) *Schwärmerische Euphorie mit chronischem Verlauf.* [Wild euphoria with a chronic course.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Apr), Vol. 22(4), 150-153.—Reports the case histories of 2 middle-aged women. Both cases were characterized by a wild euphoria. The syndrome is distinctive but is believed to be different from schizophrenia. Both patients also had religio-erotic delusions.—*K. J. Hartman.*

2794. Van Dongen, H. R. & Fortuyn, J. Droggeleever. (University Hosp., Groningen, Netherlands) *Drawing with closed eyes: Report of a case.* *Psychiatria, Neurologia, Neurochirurgia*, 1968(May), Vol. 71(3), 275-280.—Describes a case of glioma in the right parietal lobe of a 58-yr-old male. In this case the ability to draw was greatly improved by closing the eyes. Only a few similar cases have been published.—*Journal abstract.*

MENTAL HEALTH & REHABILITATION

2795. Goldston, Stephen E. (National Inst. of Mental Health, Chevy Chase, Md.) *Mental health considerations in public health: A guide for training and practice.* *Public Health Service Publication*, 1969(May), No. 1898, 3-252.—Presents proceedings of a 1968 National Conference on Mental Health in Public Health Training. Presentations by various authors cover such topics as general health administration, health education, epidemiology, biostatistics, chronic diseases, maternal and child health, public health nursing, family planning and population policies, and environmental and occupational health.

2796. Harms, Ernest. (108 E. 95th St., New York, N.Y.) *The need for differentiation in rehabilitating the mentally retarded.* *Mental Hygiene*, 1970(Jul), Vol. 54(3), 457-458.—Challenges the educational psychology research teams to develop views and techniques to meet the differing "dynamic aspects" of various characteristic forms of psychopathology, specifically, cerebral palsy, polio, and epilepsy.—*A. M. Cawley.*

2797. Misawa, Gichi. [Activities of psychologists in the field of rehabilitation for the handicapped in European countries.] *Japanese Journal of Clinical Psychology*, 1968(Jul), Vol. 7(2), 128-131.

2798. Terhune, William B. (Silver Hill Foundation, New Canaan, Conn.) *Mastering your emotions: Mental health through reeducation of self.* New York, N.Y.: William Morrow, 1970. 249 p. \$5.95.

2799. Tseng, M. S. (West Virginia U.) *Locus of control as a determinant of job proficiency, employability, and training satisfaction of vocational rehabilitation clients.* *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 487-491.—Investigated job proficiency, personal quality, employability, need for achievement, fear of failure, and 16 other personality attributes of 140 vocational rehabilitation clients in relation to their locus of control. Correlates of the locus of control were the S's compliance with rules, observance of safety practices, care of equipment, ability to work with others, work tolerance, manners in the shop, training satisfaction, and 16 PF factors B and G. Internals and externals showed significant mean differences on their ability to work with others, cooperation, self-reliance, courtesy, reliability, work tolerance, work knowledge, care of equipment, safety practices, compliance with shop rules, training satisfaction, need

for achievement, and 16 PF factors B, G, Q₁, and Q₂.—*Journal abstract.*

COUNSELING & GUIDANCE

2800. Pedersen, Paul B. **A proposal: That counseling be viewed as an instance of coalition.** *Journal of Pastoral Care*, 1968(Sep), Vol. 22(3), 139-146.—Presents a theory of counseling which introduces the client's problem as a 3rd factor in the client-counselor relationship thus creating a triadic means-oriented relationship. It is hypothesized that the coalition formation can be anticipated when "the initial distribution of resources among members" and the pay-off rewards are known. Perceptual field theory is utilized. Interpretation, confrontation, and control are used by the counselor to align himself with the client against the problem. A ratio of relationships, general structure of behavioral change, limitations of unidimensional theoretical approaches, and predictions for different approaches are suggested by the coalition analogy. Case reports are included.—G. Steele.

2801. Robinson, Francis P. (Ohio State U.) **The growth of counseling psychology.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 385-387.—Discusses those evidences of growth in the field of counseling psychology which are indicated by the number of manuscripts submitted, the rejection rate, the number of pages published, and the circulation of the *Journal of Counseling Psychology* each yr. during its 16-yr history. Observations on common errors in manuscripts submitted are also made.—*Journal abstract.*

2802. Shutts, Ellis L. (U. Missouri, Kansas City) **The effects of group games counseling and group centered counseling with a population of hospitalized children and adolescents.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5247-5248.

2803. Strong, Stanley R. (U. Minnesota) **Causal attribution in counseling and psychotherapy.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 388-399.—Presents a behavioristic view developed from attribution theory of how persons acquire knowledge of their psychological characteristics, and examines counseling from this framework. Persons infer underlying motivational characteristics to account for actions they assign to personal causes. Assignment of cause is based on social comparison and counseling provides such comparison. Implications of this view for counseling include: (a) why clients come to counseling; (b) how counselors change clients' views of their psychological characteristics, and how counselors change clients' behavior; (c) counselor characteristics; and (d) limits to the effectiveness of counseling. (31 ref.)—*Journal abstract.*

2804. Tarnower, William. (Menninger Foundation, Topeka, Kan.) **The experience of seeking and receiving help.** *Journal of Pastoral Care*, 1968(Sep), Vol. 22(3), 147-151.—Presents a representation of a client-counselor relationship and the treatment process. The conflicts revealed are real and universal. The client's feelings about receiving help and his perception of the therapist are expressed.

2805. Ullrich, Maureen F. (Southern Illinois U.) **The effect of expectancy on vocational counseling.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5704.

2806. Weiss, David J. (U. Minnesota) **Factor analysis and counseling research.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 477-485.—Dis-

cusses topics including factor analysis vs. cluster analysis, analysis of Q correlation matrices, ipsativity and factor analysis, and tests for the significance of a correlation matrix prior to application of factor-analytic techniques. Techniques for factor extraction discussed include principal components, canonical factor analysis, alpha factor analysis, principal factors and image factor analysis, and multimethod factor analysis. (26 ref.)—*Journal abstract.*

Marriage & Family

2807. Blair, Maudine. (Florida State U.) **Divorcedes' adjustment and attitudinal changes about life.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5541-5542.

2808. Bontrager, Helen L. (U. Kansas) **Patterns of family interaction with emotionally disturbed versus nondisturbed siblings in a teaching situation.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5683-5684.

2809. Meadows, Mark E. & Taplin, Jaci F. (Auburn U.) **Premarital counseling with college students: A promising triad.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 516-518.—Describes a premarital counseling model and its application in a university counseling center. 6 engaged student couples participated in a series of individual and joint counseling interviews. Results of a postcounseling questionnaire are discussed, revealing a positive response on the part of clients. The premarital counseling triad is recommended as an appropriate and needed service in the college setting.—*Journal abstract.*

2810. Streeter, Noble M. & Owens, W. Eugene. (1st Presbyterian Church, Redding, Calif.) **Partners in ministering: A psychiatrist and a pastor.** *Community Mental Health Journal*, 1970(Aug), Vol. 6(4), 292-299.—Suggests criteria essential for good interdisciplinary relationships between a pastor and psychiatrist working conjointly in therapy. It is suggested that: (a) stereotypes and traditional roles are barriers which must be "worked-through"; (b) the "working-through process" may not be applicable to every professional dyadic relationship, but the conjoint approach might be considered in addition to current *modus operandi*; and (c) interdisciplinary cotherapists must utilize the same process they are trying to teach their patients.—*Journal abstract.*

Social Casework

2811. Levine, Baruch & Schild, Judith. (U. Chicago, School of Social Service Administration) **Group treatment of depression.** *Social Work*, 1969(Oct), Vol. 14(4), 46-52.—Suggests that a group treatment approach based on the integration of casework and group treatment methodology is a viable means of serving depressed clients without overburdening the limited agency and worker resources, i.e., as group members relate to each other, they are less manipulative of and dependent on the worker. 3 stages of treatment are identified: mutual mourning, ego reactivation, and mastery. The characteristics of each stage, the rationale for specific therapeutic interventions, and case examples are presented.—*Journal summary.*

2812. MacNamara, Margaret. (U. Adelaide, South Australia) **The crisis of dialysis and renal homo-**

transplantation: A team approach to patients and families. *British Journal of Psychiatric Social Work*, 1968(Fal), Vol. 9(4), 193-200.—Describes the activities of the social worker in a renal unit of an Australian hospital. The importance of close collaboration between members of a multidisciplinary team in working with the patient, donors, and family members is stressed.—P. McMillan.

2813. Vail, Susan. (Smith Coll., School for Social Work) **The effects of socio-economic class, race, and level of experience on social workers' judgments of clients.** *Smith College Studies in Social Work*, 1970(Jun), Vol. 40(3), 236-246.—140 professional social workers and 140 student social workers were mailed descriptive material on a client and were asked to assess the potential and level of treatment proposed. Additional data on the client's social class and race were included. Information on age, sex, and level of experience were obtained on the social workers. Findings from 170 Ss showed that socioeconomic class of the client significantly influenced caseworkers in assessment and plan for treatment. Race of the client and level of experience of the social worker were not related to assessment.—M. W. Linn.

PHYSICAL HANDICAP

2814. Rosillo, Ronald H. & Fogel, Max L. (U. Pennsylvania, Medical School) **Emotional support.** *Psychosomatics*, 1970(May), Vol. 11(3), 194-196.—Views emotional support as an interactive process involving a temporary borrowing of ego strength from the supporter for the help of the supported. This process is mediated by the mechanisms of identification and magical thinking. Illustrations from a group of physically disabled patients, who used a 7-point scale to evaluate the roles they usually adopted in interpersonal relationships are presented. Emotional abreaction, which sometimes occurs during emotional support, is viewed as a related but separate process.—P. McMillan.

Blindness & Visual Disorder

2815. Groffman, Sidney. **Operant conditioning and vision training.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Aug), Vol. 46(8), 583-593.—Vision training is concerned with modification of visual behavior. Operant conditioning is a method of behavior modification useful for improving the design of vision training programs and insuring patient interaction with such programs. The optometric application of operant conditioning is illustrated by 2 experimental studies. In Exp. I, with an 8-yr-old girl, individual patient control was obtained by restructuring an existing vision training procedure. Exp. II, with 5 3rd and 4th grade boys, demonstrated the extinction of disruptive behavior in group vision training through the use of a token reinforcement system.—*Journal abstract*.

2816. Petrov, Yu. P. **Osnovnye problemy fiziologii zritel'nogo analizatora v ékstremaal'nykh usloviyakh.** [Basic problems in the physiology of the visual analyzer in extremal conditions.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 118-123.—Presents a survey of research on disturbances of visual functions (narrowing of the visual field, decrease in visual acuity, deterioration of color vision, pathological vasomotor effects, etc.) under the influence of the following extremal factors: changes in

gravity, changes in the pressure of the atmosphere and its composition, mechanical oscillations (vibration, noise), and the action of different parts of the electromagnetic spectrum. Possible mechanisms underlying these disturbances are discussed.—I. D. London.

2817. Warren, R. L. (3540 E. 31st St., Tulsa, Okla.) **What constitutes blindness? II. Psychology.** *Journal of the American Optometric Association*, 1969(Nov), Vol. 40(11), 1116-1120.—Provides practical suggestions for the understanding and management of the low vision patient. Special needs of patients with 3 categories of visual loss are discussed, including those with problems (a) existing at birth, (b) of recent origin, and (c) existing for many yr. Sociological and monetary considerations are presented in terms of the person who is considering entering the vision care field. It is noted that the tendency to view vision care as a humane act and therefore something to be given away is 1 of the chief deterrents to the expansion of the field of optometry. Specific suggestions for determining the cost of an optometric service are reviewed.—P. McMillan.

Deafness & Hearing Disorder

2820. Larson, Alfred D. (U. Kansas) **A comparative study of the ability of children with high frequency hearing loss and normal children to discriminate low-pass filtered speech.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5168-5169.

2821. VanderWoude, Kenneth W. (Michael Reese Hosp., Inst. for Psychosomatic & Psychiatric Research & Training, Chicago, Ill.) **Problem solving and language.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 337-342.—Attempted to combine the methodological approach indicated by H. Furth and M. Vernon in a study of problem-solving processes. It was hypothesized that there would be (a) no differences in the problem-solving processes used by matched groups of hearing and deaf children, and (b) no interaction between language and problem-solving performance. 18 deaf children (nonverbal group) were matched with 18 hearing children (verbal group) on the basis of age, sex, and IQ. Results confirm the hypothesis and indicate that both groups use similar tactics in their solutions to the problems. Also, for both groups there is no consistent relationship between problem-solving processes and final answers. (36 ref.)—*Journal summary*.

SPEECH DISORDER

2822. Adams, Martin R. & Brutten, Gene J. (Kent State U.) **An exploratory study of some learning-based procedures for modifying stuttering.** *Journal of Communication Disorders*, 1970(Aug), Vol. 3(2), 123-132.—15 15-44 yr. old stutterers read aloud, 3 times in

succession, a list of 75 common monosyllable nouns. Words that were consistently stuttered or spoken with consistent fluency were the test elements of this study. In the experimental conditions, $\frac{1}{2}$ of these words were audibly presented to the Ss in quick succession. In the matched silent condition, the other $\frac{1}{2}$ of the consistently stuttered or fluent words were not repetitively presented. After each of these situations, Ss orally read the original word list 3 additional times. The consistency of stuttering decreased significantly in both the auditory and silent conditions. Less absolute stuttering occurred in the auditory condition than in the silent condition but, apparently because of sample size, significance was not reached. Consistent fluency, like consistent stuttering, was demonstrated to be a reliable phenomenon. The consistency of stuttering and fluency is viewed in conditioning terms; the decrease in stuttering is viewed in deconditioning terms.—*Journal abstract.*

NEUROLOGICAL DISORDER

2826. Akhutin, E. A. **Spisok knig po nevropatologii, psikiatrii i smezhnym distsiplinam, postupivshikh v Gosudarstvennyy tsentral'nyy nauchnyy meditsinskyy biblioteku v sentyabre-oktyabre 1969 g.** [List of books on neuropathology, psychiatry and contiguous disciplines, arriving at the State Central Scientific Medical Library in September-October 1969.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 310-312.—Lists Soviet and non-Soviet publications.—*I. D. London.*

2827. Amler, G. & Gergener, M. (U. Dusseldorf, Psychiatric Clinic, W. Germany) **Typisches EEG-Muster beim Creutzfeldt-Jakob-Syndrom unter Berücksichtigung diagnostischer und differentialdiagnostischer Gesichtspunkte.** [The typical EEG pattern with Creutzfeldt-Jakob-syndrome with consideration of diagnostic and differential diagnostic aspects.] *Psychiatria et Neurologia*, 1967, Vol. 154(6), 373-383.—In a case of the Creutzfeldt-Jakob syndrome, a typical EEG pattern was found showing rhythmically appearing step high voltage waves arising against a background of severe generalized abnormalities. In conjunction with similar observations reported in the literature, these EEG changes are regarded as pathognomonic for the Creutzfeldt-Jakob syndrome (subacute spongy encephalopathy) and the focus of origin of the dominant signs of rhythmization and hypersynchronization can be localized into deep centrocephalic subcortical areas of the brain. Certain parallels with subacute encephalitis do exist. The typical EEG changes in the Creutzfeldt-Jakob syndrome appear mainly when the progress of the disease process shows evidence of involvement of basal areas of the brain. The fact that it is astroglia rather than neuronal tissue which is affected by the disease process is

obviously of no importance, and must be interpreted in the light of the newest research findings of the functional and biochemical unity of neurons and glia. (33 ref.)—*English summary.*

2828. Billevich-Popova, A. S. (Inst. of Neurology, Moscow, USSR) **Narusheniya elektricheskoi aktivnosti myshts u "zdorovykh" rodstvennikov lits, stradayushchikh semeinoi spasticheskoi paraplegiei Shtryumpelya.** [Disturbances of electrical activity of the muscles in "healthy" members of families of persons suffering from Strümpel's familial spastic paraplegia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 218-224.—Reports the results of an EMG study of 28 "healthy" members of 7 families, individual members of which were suffering from familial spastic paraplegia. 12 exhibited disturbances of muscular electrogenesis, characteristic for spastic enhancement of muscular tonus; 6 displayed attenuated forms of the spastic syndrome; and 10 manifested no pathology of muscular tonus. The results of EMG examinations, which also take into account the available clinical and genealogical data, can be utilized for diagnosis of the "minor" forms of Strümpel's spastic paralysis as well as of its initial stages. (English summary)—*I. D. London.*

2829. Boller, Francois C. & Sherwin, Ira. (Veterans Administration Hosp., Boston, Mass.) **Electroencephalography and brain scan in the diagnosis of posterior fossa lesions.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 490-493.—Compares the relative usefulness of EEG and brain scan tests, both described as repeatable and safe procedures, in diagnosing posterior fossa tumors. Data were drawn retrospectively from the hospital records of 9 patients with a verified diagnosis of posterior fossa pathology on whom both EEG and brain scan had been obtained. Examination of records revealed that EEG was of localizing value in 8, but a positive brain scan was found in only 3. The discrepancy between these brain scan findings and more positive findings by others in the literature is discussed. It is noted that a special head position (not used in the cases studied here) might increase the yield of positive scans. It is concluded that together EEG and brain scan are of complementary value in diagnosing posterior fossa tumors.—*P. McMillan.*

2830. Eisen, A. A. & Norris, J. W. (McGill U., Montreal, Quebec, Canada) **Adrenal steroid therapy in neurological disease: I.** *Canadian Medical Association Journal*, 1969(Jan), Vol. 100(1), 27-30.—Examines "the therapeutic uses of the adrenal steroids, their synthetic analogues and the adrenocorticotrophic hormone (ACTH) as applied to diseases of the nervous system." Collagen diseases, diseases of muscle and the neuromuscular junction, and demyelinating disease are discussed. (47 ref.)

2831. Ernst, K. & Sayk, J. (Universitäts-Nervenklinik, Rostock, E. Germany) **Untersuchungen zur reflektorischen Aktivierbarkeit spinaler Motoneurone bei spastischen, myogenen und peripher-neurologischen Erkrankungen.** [Investigations into the activity of spinal motoneurons in spastic, myogenic and peripheral-neurological diseases.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Apr), Vol. 22(4), 140-146.—Electroneurographic studies of 122 patients failed to yield statistically significant differences in afferent conductance between normal and pathological muscle tone or spinal excitability. (49 ref.)—*K. J. Hartman.*

2832. Gannushkina, I. V. (Inst. of Neurology, Moscow, USSR) **Znachenie autoantigennosti élementov nervnoy tkani pri sosudistyykh i travmaticheskikh porazheniyakh mozga.** [Significance of the autoantigenic character of nerve tissue elements in vascular and traumatic lesions of the brain.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 172-177.—Studied the role of the autoantigenic properties of nervous tissue in the development of pathological processes in the brain, which arise as a result of acute and even momentary damage of the hematoencephalic barrier and which are of vascular or traumatic origin. It is shown that prior sensitization of animals to the antigens of nervous tissue complicated the clinical picture in brain injury and in cerebral circulatory disorders, as a result of the antigen-antibody reaction that occurred in the brain under these conditions. The sera of specifically sensitized animals and patients with multiple sclerosis contained anticerebral antibodies which were fixed on certain elements of the nerve and glial cells as revealed in the Kuns immunofluorescent test; the sera of patients with cerebral circulatory disorders, hepatocerebral dystrophy, and lateral amyotrophic sclerosis contained anticerebral antibodies which were fixed on the basal membranes of small vessels and capillaries. (English summary)—*I. D. London.*

2833. Gel'fand, I. M., et al. (Inst. of Neurology, Moscow, USSR) **Matematicheskoe prognozirovaniye iskhodov pri gemorragicheskikh insul'takh s tsel'yu opredeleniya pokazaniy k ikh khirurgicheskomy lecheniyu.** [Mathematical prediction of outcomes in hemorrhagic strokes with the aim of determining the indications for their surgical treatment.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 177-181.—Analyzed 124 case histories of patients with cerebral hemorrhages, developed out of high blood-pressure and atherosclerosis. 56 indices, the most significant for predicting hemorrhagic strokes, were taken into account along with their dynamics for 12 hr. following the onset of the stroke. Computer analysis of these indices yielded correct prognoses of survival over the 1st 5 days with 95% accuracy. (English summary)—*I. D. London.*

2834. Grechko, V. E. & Florianovich, N. M. **Mediko-tekhnicheskile trebovaniya k apparature dlya ékhóntsefalografii.** [Medico-technical requirements demanded of apparatus for echoencephalography.] In V. V. Parin (Ed.), *Sovremennyye pribory i tekhnika fiziologicheskogo éksperimenta.* (See PA, Vol. 45:Issue 2) 161-163.—Examines the possibilities of applying echoencephalography in the diagnosis of cerebral pathological processes, and defines necessary characteristics for echoencephalographic instrumentation.—*I. D. London.*

2835. Heitzman, Martin & Johnston, Gerald S. (Walter Reed General Hosp., Div. of Neurology & Nuclear Medicine, Washington, D.C.) **Radioactive bromide in the diagnosis of central nervous system disease.** *Diseases of the Nervous System*, 1970(Jul), Vol. 31(7), 483-486.—Determined a blood serum/cerebrospinal fluid (CSF) bromide partition ratio on 24 patients with CNS disorders. Sodium bromide-82 was administered and the serum and CSF collected for radioactivity assay at 24 hr. 5 Ss presented with possible neurosyphilis and 1 with possible tuberculous meningitis. The bromide partition ratio was helpful in determining the diagnosis in each of these Ss and their case histories are summarized. In the 18 remaining Ss, with a variety of CNS conditions, including head injury, multiple scler-

osis, Guillain-Barre syndrome, chorioretinitis, epilepsy, pituitary tumor, and herniated nucleus pulposus, the bromide partition was normal. The specificity of this test for active neurosyphilis and for tuberculous meningitis gives it value in ruling out these entities and confirming their presence.—*Journal summary.*

2836. Kanareikin, K. F. **Sovmestnaya nauchnaya sessiya Instituta nevrologii AMN SSSR i Instituta nevrologii Akademii nauk Sotsialisticheskoi Respubliki Rumynii, posvyashchennaya mozgovym insul'tam.** [Joint Scientific Session of the Institute of Neurology of the USSR Academy of Medical Sciences and the Institute of Neurology of the Romanian Academy of Sciences, devoted to cerebral strokes.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(2), 91-93.—Presents summaries of a number of the papers read at the 1969 conference, held in Bucharest, Romania.—*I. D. London.*

2837. Khalfina, F. A. (Research Inst. of Neurology & Psychiatry, Kharkov, USSR) **Izmeneniye zritel'nykh posledovatel'nykh obrazov v klinike prekhodyashchikh narusheniy krovoobrashcheniya v vertebral'no-bazilyarnoi sisteme.** [Changes in successive visual images in the clinical picture of transient circulatory disturbances in the vertebrobasilar system.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 182-186.—Studied visual trace effects (successive images and successive contrasts) in 50 33-72 yr. old patients. 1 deviation or another was detected in the dynamics of the successive images and contrasts. In the beginning, the character of the course of successive images was changed following the presentation of colored and multicolored test objects; then there was a loss of capacity to differentiate an added form (white circle on a black background, yellow horseshoe on a black background) after exposition of the "combined" test objects. The grossest pathology, observed in almost 1/2 the patients, was the disappearance or sharp diminution of retention time of the afterimage following the presentation of colored, combined, and black test objects. The frequent disturbance of visual trace reactions in the presence of circulatory disorders in the vertebrobasilar system, often in the absence of defects in the visual field and of other symptoms, indicated that this test can disclose fine changes in the neurodynamics in the cortical terminus of the visual analyzer, which is supplied with blood from the basin of the posterior cerebral artery. (English summary)—*I. D. London.*

2838. Khondkarian, O. A. & Maksudov, G. A. (Inst. of Neurology, Moscow, USSR) **K épidemiologii bokovogo amiotroficheskogo skleroza.** [On the epidemiology of lateral amyotrophic sclerosis.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(1), 83-86.—Preliminary studies suggest that serious research should be directed to the problem of epidemiology of lateral amyotrophic sclerosis, since there is some basis for conjecturing the possibility of a latent infection in this disease.—*I. D. London.*

2839. Kuznetsova, A. S. (Kuusinen U., Petrozavodsk, USSR) **Diagnosticcheskoe znachenie defektov polia zreniya pri subarakhnoidal'nykh krovoizlivaniiyakh.** [Diagnostic significance of visual field defects in subarachnoid hemorrhages.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 195-199.—Ss were 14 patients with hemorrhaging into the subarachnoid space and consequent stable changes in the visual field. Homonymous hemianopsia, developing from hemorrhages from dif-

ferent vascular regions, were observed in 11 Ss. A combination of homonymous hemianopsia with paresis of the oculomotor nerve is characteristic for hemorrhages from a supracallosal aneurysm of the internal carotid artery. In combination with apathetic disorders, the hemorrhage probably occurs from the radicular branches of the middle cerebral artery. In isolated hemianopsia without affection of cranial nerve innervation and hemiparesis, or combination with cerebellar changes, the hemorrhagic foci are probably located in the region of the posterior cerebral artery. Full loss of sight in the acute period of the disease is an unfavorable sign for visual restitution and is most likely due to hemorrhages from the anterior connective artery. (English summary) —I. D. London.

2840. Lebedeva, N. V. (Inst. of Neurology, Moscow, USSR) *Opređenje glubiny ochaga pri krovolyaniyakh v bol'shie polushariya golovnogogo mozga.* [Determination of depth of the hemorrhagic focus in the cerebrum.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 168-171. — Presents the results of clinical examination of 242 patients with cerebral hemorrhage in combination with (a) EEG data obtained during the hours immediately following the onset of the hemorrhage, and (b) the data of angiography when they provide sufficient basis for accurate topical diagnosis of the depth and the location of the hemorrhage, backwards in the parieto-occipital direction or forwards in the direction of the frontal lobe. (English summary) —I. D. London.

2841. Lugovskii, B. K. (Provincial Psychiatric Hosp., Mogilev, USSR) *K voprosu o klinike bolezni Friedreicha, protekayushchei s psikhicheskimi narusheniyami.* [On the clinical picture in Friedreich's disease, proceeding with mental disturbances.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jan), Vol. 70(1), 101-106. Reports on 4 cases of Friedreich's ataxia (a recessive hereditary anomaly, marked by muscular incoordination and twitching), accompanied by severe mental disorders involving progressive dementia and affective (dysphoric) disturbances. In 2 cases paranoid, hallucinatory-paranoid, and catatoniform symptoms were manifested. Friedreich's disease is to be differentiated from neural amyotrophy and from Marie's disease, since in all the cases observed peripheral pareses of the extremities appeared. —I. D. London.

2842. Martindale, Colin & Black, F. William. (Harvard U.) *Season of birth and intelligence.* *Journal of Genetic Psychology*, 1970(Sep), Vol. 117(1), 137-138. To determine the effect of season of birth on IQ, 10 neurologically damaged children born in each of the 12 mo. were evaluated using the Stanford-Binet (N = 46), the WISC (N = 44), and the Arthur Adaptation of the Leiter International Performance Scale (N = 30). Summer-born Ss were found to perform significantly better. There was a clear curvilinear relationship between mean temperature of mo. of birth and IQ. Prenatal and perinatal stress is suggested as a causal factor. —F. W. Black.

2843. Nikiforov, B. M. (Pediatric Medical Inst., Leningrad, USSR) *Tromboz meshotchatykh anevrizm posle podpautinnogo ili subarakhnoidal'no-parenkhimatoznogo krovolyaniya.* [Thrombosis of sacular aneurysms following subarachnoid-parenchymatous hemorrhage.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 209-212. — Reports results of carotid angiography undertaken to detect the presence of sacular

aneurysm in 306 patients with subarachnoid hemorrhaging. (English summary) (16 ref.) —I. D. London.

2844. Olson, Norinne H., Olson, Arthur V., & Duncan, Patricia H. *Neurological dysfunction and reading disability.* *Reading Teacher*, 1968(Nov), Vol. 22(2), 157-162. — Reviews research on neurological dysfunction associated with reading disability and on the parts of the brain involved in the reading process. Alexia, dyslexia, mixed-lateral dominance, and strephosymbolia are examples of the types of disability involving neurological dysfunction. It was found that these types often coexist "with more broadly classified neurological categories." It is concluded that "in proper dynamic diagnosis they [neurological symptoms] should be regarded, along with other significant correlates of performance, in the synthesis of a disability profile." —G. Steele.

2845. Prudenskii, E. A. (Gorki Medical Inst., Donetsk, USSR) *Spinal'naya flebografiya v differentsial'noi diagnostike bolevykh poyasnichno-kresttsyovnykh sindromov.* [Spinal phlebography in differential diagnosis of lumbosacral pain syndromes.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 186-191. — Of 52 17-67 yr. old patients, 30 had spinal osteochondrosis with pronounced radicular pain symptoms, 16 exhibited inflammatory processes (cauditis, meningoradiculitis), and 6 had varicosis of the spinal veins. For each group it was possible to distinguish characteristic changes in the system of spinal venous plexures. A certain relationship existed between the character of phlebographic changes and the intensity of radicular pain syndromes. (English summary) —I. D. London.

2846. Snezhnevskii, A. V., et al. *"Zhurnal nevropatologii i psikiatrii im. S. S. Korsakova" 70 let.* [The 70th anniversary of the "S. S. Korsakov Journal of Neuropathology and Psychiatry".] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jan), Vol. 70(1), 132-134. Presents a history of the journal, which from 1930-1951 bore variant names. —I. D. London.

2847. Stang, R. R. *The etiology of Parkinson's disease.* *Diseases of the Nervous System*, 1970(Jun), Vol. 31(6), 381-390. Postulates that there is a single disease — parkinsonism, with a common etiology, multiple precipitating factors, and highly variable onset, course, and symptomatology. A genetic study was made of unselected patients with parkinsonism, 110 males (3 adopted) and 90 females (2 adopted). Data from a questionnaire indicated that parkinsonism was or had been present in 198 parents (155 having at least 1 sibling with the disease), and at least 135 siblings, 33 children, and 134 grandparents (75 having at least 1 sibling with the disease). "Thus parkinsonism in characteristic hereditary form was present in 94.5% of Ss. It is concluded that (a) all forms of the disease are hereditary and degenerative, (b) mode of inheritance is autosomal dominant, and (c) the disease is likely to increase rather than decrease in incidence. The diverse clinical nature of parkinsonism, due in part to "the age at which it begins and its duration when the patient is seen," is primarily due to the resultant interaction between the nature of the precipitating factors and "the degree of reactivity of the inherited substrate material." (21 ref.) —P. McMillan.

2848. Suchkov, V. V. (Myasnikov Inst. of Cardiology, Moscow, USSR) *Vliyaniye gipoksii mozga na sino-karotidnye refleksi i rol' baroretseptorov karotidnykh sinusov v kompensatsii mozgovykh tsirkulyatornykh narushenii.* [Influence of cerebral hypoxia

on the sinocarotid reflexes and the role of the carotid sinus baroreceptors in compensation for cerebral circulatory disturbances.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 77-86.—Using 30 narcotized dogs, it was shown that (a) the carotid sinus baroreceptors participated continuously in regulating cerebrovascular tonus, and (b) depressor reactions to stimulation of the carotid sinus baroreceptors acquired a pressor character, as cerebral hypoxia increased, and became distorted in deep cerebral hypoxia. Compensation for cerebral hypoxia and the emerging magnitude of the cerebroischemic hypertension depended on the functional state of the carotid sinus baroreceptors. Optimal compensation was observed when the baroreceptors were in the normal state. Both their excitation and the absence of stimulation complicated the course of hypoxia and promoted the appearance of more pronounced hypertensive reactions to cerebral hypoxia. Hypoxic excitation of the pressor regions of the vasomotor center and inhibition of its depressor regions constituted the mechanisms for bringing about a change in the sinocarotid reflexes. *I. D. London.*

2849. Vil'shanskaya, M. I. *Spisok otechestvennykh dissertatsii po nevropatologii, psikhiatrii i smezhnym dissiplinam, postupivshikh v Gosudarstvennyy tsentral'nyy nauchnyy meditsinskuyu biblioteku v III kvartale 1969 g.* [List of dissertations in the Soviet Union on neuropathology, psychiatry and contiguous disciplines, arriving at the State Central Scientific Medical Library in the 3rd quarter of 1969.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 313-315.—Lists 63 dissertations.—*I. D. London.*

2850. Weiskrantz, L. & Warrington, Elizabeth K. (Inst. of Experimental Psychology, Oxford, England) **Verbal learning and retention by amnesic patients using partial information.** *Psychonomic Science*, 1970(Aug), Vol. 20(4), 210-211.—Showed that learning and retention occurred in 3 amnesic patients when the partial information about words was in the form of whole letters. Results tend to discount an interpretation in terms of spared perceptual learning in such patients.—*Journal abstract.*

2851. Zlotnik, E. I., Oleshkevich, F. V., & Pavlovets, M. V. (Belorussian Research Inst. of Neurology, Neurosurgery, & Physiotherapy, Minsk, USSR) **Atipichnoe techenie gemorragicheskogo perioda pri oslozhnenii razryva anevrizmy arterial'nym spazmom i vnutrimozgovoi gematomoi.** [Atypical course of the hemorrhagic period due to the complication of aneurysmal rupture by arterial spasm and intracranial hematoma.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(2), 212-216.—Discusses 5 cases where, despite angiographically detected intracranial hematomata and cerebroarterial spasm, the hemorrhagic period went off lightly with no postoperative neurological disorders. (English summary)—*I. D. London.*

Brain Damage

2852. Bartko, Daniel & Trávníková, Margaréta. (Comenius U., Neurological Clinic, Bratislava, Czechoslovakia) **Acute focal hypoxia of the brain and personality changes.** *Studia Psychologica*, 1970, Vol. 12(1), 69-75.—Attempted to determine (a) "whether a psychological investigation will reveal certain concepts on the mental and personality changes in acute focal hypoxia of the brain," and (b) "whether these changes

will bear some correlation to the degree of organic lesions, or to their localization and laterality." Experimental Ss were 91 patients, average age 59.6 yr., with acute focal hypoxia of the brain (36 with lesions on the right, 42 on the left, and 13 with bilateral lesions). Controls were 30 hypertonic and arteriosclerotic Ss, with a mean age of 53.6 yr. Test instruments used were the Wechsler-Bellevue for intellectual functioning and the ROR projective technique for personality factors. Results indicate that a marked decrease in the overall IQ occurred in groups with acute focal brain hypoxia, severe neurological findings, and left-sided, cortically and supratentorially localized lesions. Similar changes were noted in verbal IQ, but the most pronounced changes were in the performance component. "Disorders of emotionality occurred in 88.6% of cases in the entire sample, which constitutes a significant difference against the 70% in the control group." (17 ref.)—*P. McMillan.*

2853. Ingebrigtsen, Brynjulf. (Ullevål Hosp., Oslo, Norway) **Arachnoid rupture as cause of the postconcussion syndrome: A new theory of the pathophysiology.** *Acta Neurologica Scandinavica*, 1969, Vol. 45(2), 231-237.—Presents a new theory for the pathogenesis of the postconcussion syndrome. It is hypothesized that the syndrome is caused by a traumatic rupture of the arachnoid membrane with secondary accumulation of cerebrospinal fluid in the subdural space. The following pathophysiological consequences are considered likely: (a) brain deformation, (b) increased vulnerability to mechanical injuries, and (c) impaired circulation of blood and cerebrospinal fluid. This explains the uniformity of the symptoms in the postconcussion syndrome. It is concluded that most of the symptoms of the postconcussion syndrome can be satisfactorily explained by this theory.—*Journal summary.*

2854. Newcombe, Freda & Russell, W. Ritchie. (Churchill Hosp., Oxford, England) **Dissociated visual perceptual and spatial deficits in focal lesions of the right hemisphere.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1969(Apr), Vol. 32(2), 73-81.—81 right-handed men with focal, unilateral brain lesions due to missile injury were reexamined neurologically and psychologically, 20 yr. after World War II in an on-going study of the long-term sequelae of these injuries. The performance of 44 Ss with unilateral lesions of the left hemisphere and 37 Ss with right hemisphere lesions in 2 visually-presented tasks, face identification (closure) and maze-learning are reported. Ss with right hemisphere lesions were significantly impaired in both tasks, whereas Ss with lesions in the left hemisphere performed as well as normal controls. There was also evidence of dissociated deficits within Ss with right post-Rolandic lesions: there was no overlap in scores of Ss most severely impaired in closure and those most severely impaired in maze-learning. The anatomical characteristics and some other features of these groups are discussed. Data support the concepts of hemispheric asymmetry and of functional differentiation within the hemisphere. (48 ref.)—*Journal summary.*

Epilepsy

2855. Broughton, Roger; Meier-Ewert, Karl H., & Ebe, Mituru. (U. Ottawa, Ontario, Canada) **Evoked visual, somato-sensory and retinal potentials in**

photosensitive epilepsy. *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 373-386.—Made a comparison of the group mean visual evoked potential (VEP), somato-sensory evoked potential (SEP) and electroretinographic (ERG) response between 10 photosensitive epileptic Ss and 10 age and sex-matched normal controls. The VEP of Ss was similar in wave form but differed significantly in a number of other features from that of controls, all components being of larger amplitude in photosensitive Ss. There was evidence for alteration of the ERG in the form of an earlier α wave. The changes indicate participation in photosensitivity of: the retina; visual pathways of primary, secondary and associative type; unspecific diffuse projection systems projecting maximally to the vertex; or local changes of the central cortex. Differential stages of sleep and states of arousal produced quite stereotyped changes of the VEP. The SEP was altered even more than the VEP. Individual components showed marked changes in amplitude, latency and distribution, some having mean amplitudes of up to 8 times normal. It is suggested that "photosensitivity" represents a diffuse multimodal alteration in cerebral excitability affecting various levels of different sensory systems. (French summary) (41 ref.)—*Journal summary*.

2856. Corkin, Suzanne; Milner, Brenda, & Rasmussen, Theodore. (McGill U., Montreal, Quebec, Canada) **Somatosensory thresholds: Contrasting effects of postcentral-gyrus and posterior parietal-lobe excisions.** *Archives of Neurology*, 1970(Jul), Vol. 23(1), 41-58.—127 Ss who underwent unilateral cortical excision for relief of focal epilepsy yielded preoperative, postoperative, and follow-up data on somatosensory discrimination. Tests of pressure sensitivity, 2-point discrimination, point localization, position sense, and tactual object recognition revealed lasting sensory loss associated with lesions of the postcentral gyrus. Parietal-lobe excisions were followed by transient deficits or no deficits. Ipsilateral sensory defects, related to lesion size, appeared in 12 of 50 patients in the parietal-lobe groups. (37 ref.)—S. E. Gavin.

2857. Ebe, Mituru; Meier-Ewert, Karl H., & Broughton, Roger. (McGill U., Montreal, Quebec, Canada) **Effects of intravenous diazepam (Vallum) upon evoked potentials of photosensitive epileptic and normal subjects.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 429-435.—Studied the effects of 7.5-10 mg. of iv diazepam in 7 patients with photo-sensitive epilepsy and in 9 normal controls. Minimal side effects occurred in 3 controls, but not in the epileptic Ss. Diazepam rapidly blocked the photoconvulsive and photomyoclonic responses of epileptic Ss, and reduced the blinking and autonomic or vegetative changes induced by photic stimulation. Spontaneous epileptic discharges were abolished. In both epileptic and normal Ss, beta activity appeared in the EEG maximally in anterior head regions, and marked hypotonia and subjective relaxation were induced. Visual and somatosensory evoked potentials and the electroretinogram were modified. The effects of iv diazepam on the evoked potentials of photosensitive epileptics represents a normalization of cerebral reactivity. (French summary) (25 ref.)—*Journal summary*.

MENTAL RETARDATION

2858. Bialer, Irv & Sternlicht, Manny. (Kennedy

Child Study Center, New York, N.Y.) **Psychological issues in mental retardation: Report of a survey.** *Mental Retardation*, 1969(Aug), Vol. 7(4), 35-37.—To determine what are considered to be the most cogent psychological issues in mental retardation, a mail survey was conducted among 56 psychologists both in and out of that field. A strong degree of congruence was obtained between the 2 groups on issues relating to: (a) cognitive, affective, and psycholinguistic development; (b) intelligence as a concept; (c) differential diagnosis; and (d) success and failure as motivators with retardates. Differences between the 2 groups are discussed along with those issues which seem to be of generally decreasing concern and/or are newly emerging among psychologists in mental retardation.—*Journal abstract*.

2859. Corte, Henry E. (U. Kansas) **The use of punishment in the modification of self-destructive behavior of retarded children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5685.

2860. Dallaire, Louis; Kingsmill-Flynn, Diana, & Leboeuf, Giles. (Douglas Hosp., Medical Genetics Lab., Montreal, Quebec, Canada) **Autoimmunity and chromosomal aberrations: Serological studies in mothers of children with Down's syndrome.** *Canadian Medical Association Journal*, 1969(Jan), Vol. 100(1), 1-4.—2 thyroid serological tests (Tanned Red Cell Hemagglutination and Complement Fixation—CF) revealed a significant increase of antibodies in 86 euthyroid mothers of children with Down's syndrome. Results show that 23.3% of these Ss had circulating thyroglobulin antibodies as compared to 10.4% of matched controls. The complement fixation reaction with an extract of thyrotoxic gland was positive in 61% and 13.9%, respectively. Of the 13 Ss whose 1st single pregnancy resulted in a mongol child none had thyroglobulin antibodies but 7 had a positive CF test. Findings are examined in consideration of the present knowledge of thyroid autoimmunity. It is concluded that the results support the concept that a maternal autoimmune phenomenon is related to the birth of some aneuploid children and suggest that the cornerstone of the deranged immunological reaction may not be thyroid-specific. (French summary) (20 ref.)—*Journal summary*.

2861. Dickerson, Donald J. & Girardeau, Frederic L. (U. Connecticut) **Oddity preference by mental retardates.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 28-32.—Gave 3 groups of 45 12-16 yr. old severely retarded and 3 groups of 45 12-20 yr. old mildly retarded Ss a series of 5 10-trial oddity problems under nonreward conditions. The groups were presented with stimulus arrays containing 1 odd stimulus and 2, 3, or 4 identical stimuli. Results indicate that mildly retarded Ss responded to the odd object slightly less than 50% of the time, significantly above chance expectancy, whereas severely retarded Ss responded to the odd object approximately 33% of the time, significantly above chance expectancy for those groups with 3 and 4 identical stimuli. Findings suggest that oddity is a stimulus characteristic to which an approach response is made independent of its concurrent association with reward, and that the stimulus value of oddity differs for mildly and severely retarded Ss.—*Journal abstract*.

2862. Ferrell, C. Richard; Tokstad, Gary C., Listella, Guido M., & Jackson, Jay. (Fairview Hosp. & Training Center, Salem, Ore.) **Influence of a therapeutic community on behavior and adjustment of defective delinquents.** *Mental Retardation*, 1969(Dec), Vol. 7(6),

6-9.—Reports findings on the effectiveness of a therapeutic community approach to the treatment of 25 adult male defective delinquents. A comparison of S movement before and after the inception of the program showed a significant increase in placements to the community, half-way houses, or more open institutional environments. Ss' social participation in open ward meetings was rated by staff twice weekly on a behavior rating scale. Those moving to "superior" placements had made significant improvements while those moving to "inferior" placements or remaining on the ward had not improved.—*Journal abstract.*

2863. Flick, Grad L. (U. Miami) **Attention to color-form stimuli as a function of stimulus parameters and the level of adaptation in normal and mentally retarded children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5687.

2864. Gerjuoy, Irma R. & Winters, John J. **Psychological research in mental retardation.** *Mental Retardation*, 1969(Aug), Vol. 7(4), 4-10, 45.—Offers suggestions and describes techniques and methodologies that would alleviate some of the problems germane to psychological research with the mentally retarded. Recommendations are offered as a result of the authors' experiences and the observations of other Es. No resolution of all questions has been attempted, however, it is hoped that the counsel offered will help Es anticipate some of them and make them wary of the problems they may encounter. (29 ref.)—*Journal abstract.*

2865. Goda, Sidney. (120 Grand St., White Plains, N.Y.) **Language therapy for the non-speaking retarded child.** *Mental Retardation*, 1969(Aug), Vol. 7(4), 22-25.—Presents guidelines and specific procedures for a language program for children with severe deficits affecting both the encoding and decoding of language. The level of a child's speech comprehension is as important as his speech level in such a program, and should determine the materials which will be spoken or read to him. It is stressed that success depends upon the child's level of understanding, and that this should never be assumed without definite proof. The initial goal of language therapy is to make language symbols meaningful, and in teaching the nonspeaking retarded child should be associated with activities which he finds pleasurable. The use of coloring books, index cards with pictured objects, puzzles, simple toys, intraverbal responses, and carefully selected reading materials are described. It is suggested that the management and eventual placing of a retarded child in a home, is greatly facilitated when he has learned to substitute language for overt behavior.—*P. McMillan.*

2866. Hudson, Frederick P., Mordaunt, Virginia L., & Leahy, Irene. (Alder Hey Children's Hosp., Liverpool, England) **Evaluation of treatment begun in first three months of life in 184 cases of phenylketonuria.** *Archives of Disease in Childhood*, 1970, Vol. 45(239), 5-12.—184 Ss did not have the severe retardation that usually is found in untreated phenylketonuric Ss.—*A. B. Warren.*

2867. Lonsdale, Derrick & Foust, Margaret. (Cleveland Clinic, O.) **Normal mental development in treated phenylketonuria.** *American Journal of Diseases of Children*, 1970, Vol. 119(5), 440-446.—Reports on 10 Ss with hyperphenylketonuria. "The results support the belief that it is possible for the children to attain normal levels of mental development" if dietary restriction of phenylalanine is practiced during the 1st yr. of life.

Problems in the management of secondary emotional effects are discussed.—*A. B. Warren.*

2868. Mechem, Richard S. (U. New Mexico) **A study of differences in measures of overprotective attitude between mothers of high and low functioning mongoloid children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5290-5291.

2869. Monaco, T. M. & Noble, D. (Central Missouri State Coll.) **Pilot project: An activities program for mentally retarded adults.** *Central Missouri Synthesis on Mental Retardation*, 1968(Dec), Vol. 1(2), 1-4.—Tested the effectiveness of an activities program for 80 mentally retarded, institutionalized adults. By taking an active part in institutional life through recreational activities, an increase in motor performances was exhibited on a pre-post test designed to note differences in pre- and postmeasures of motor performance.—*Journal abstract.*

2870. Montgomery, Jacqueline & McBurney, Raymond. (Camarillo State Hosp., Calif.) **Problems and pitfalls of establishing an operant conditioning-token economy program.** *Mental Hygiene*, 1970(Jul), Vol. 54(3), 382-387.—After a successful project with the mentally ill, the programs were set up on 4 of 8 units (later, 8 of 9) in a new mental retardation division. Similarities in the 2 project programs include group leaders and their groups (on 3 levels), group medication, and particular attention to grooming and appropriate social behavior. Difficulties arise from breakdowns in communication and inappropriate personnel (i.e., hostile nursing service and/or disinterested physicians). "Where the environment can be controlled, behavior can be controlled and a token economy is a highly efficient way of accomplishing the training of many by a few."—*A. M. Cawley.*

2871. Paul, Howard A. & Markow, Michael J. (American Inst. for Mental Studies, Training School Unit, Vineland, N.J.) **Neurological organization exercises on retarded children with strabismus.** *Journal of the American Optometric Association*, 1969(Jul), Vol. 40(7), 706-709.—Hypothesized that an exercise program patterned along "neurological organization" lines will reduce strabismus and increase intellectual performance in retarded children. Ss were students in a training school for retarded children, and included 5 strabismic Ss (Experimental group), and 5 nonstrabismic Ss (Control Group I), all of whom received experimental treatment. 10 controls (Control Group II) received a normal physical education program. Pretreatment optometric examinations and a Merrill-Palmer Scale of Mental Tests were given to all Ss. Experimental exercises included coupling hand and foot usage, cross pattern motion of arms and legs, binocular visual pursuit of objects held and moved by others, and ball toss and kick with dominant hand and foot. Results show that the strabismic group advanced twice as much as the 2 control groups during the 6 mo. of training as based on Merrill-Palmer scores. Also a change in dominance toward right handedness was strikingly evident in the experimental group.—*P. McMillan.*

2872. Phelps, William R. (West Virginia Rehabilitation Center, Charleston) **Further evidence on the Hain scoring method for the Bender-Gestalt Test.** *Journal of Learning Disabilities*, 1968(Jun), Vol. 1(6), 358-360.—Scored 76 Bender-Gestalt protocols utilizing the Hain scoring method. Ss were 89 young adult moderately or mildly mentally retarded females. Protocols were scored for Hain's 15 differentiating signs

identifying brain damage: 37% of the rehabilitated group and 39% of the nonrehabilitated group received critical scores. Characteristics of the procedure and limitations of the study are discussed.—*Journal abstract.*

2873. Raškaya, M. M. (Inst. of Defectology, Moscow, USSR) *Znachenie tsitogeneticheskikh metodov v izuchenii etiologii oligofrenii.* [Significance of cytogenetic methods in the study of the etiology of oligophrenia.] *Defektologiya*, 1970, Vol. 2(1), 19-24.—Discusses the chromosomal bases of congenital feeble-mindedness, particularly chromosomal pathology stemming from anomalies in the sex chromosomal system.—*I. D. London.*

2874. Roicki, Maria. (Fordham U.) *A comparison of the critical flicker frequency and other perceptual tasks in mental defectives and normals.* *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5697.

2875. Stein, Zena & Susser, Marvyn. (Columbia U.) *Mutability of intelligence and epidemiology of mild mental retardation.* *Review of Educational Research*, 1970(Feb), Vol. 40(1), 29-67.—Individuals and groups vary in measured intellectual performance at different times, and an attempt is made to order knowledge about such mutability, especially as it relates to mental retardation. Environmental conditioning seems to be the greatest single factor in affecting IQ and perhaps the greatest advantage will incur through a serious attack on the social factors of poverty and unemployment. (3 p. ref.)—*P. D. Leedy.*

2876. Stephens, Wyatt E. (Southern Illinois U.) *Interpreting mental retardation to parents in a multi-discipline diagnostic clinic.* *Mental Retardation*, 1969(Dec), Vol. 7(6), 57-59.—Compares 2 methods of interpreting diagnostic findings to the parents of handicapped children. The "virtuoso model" involves the diagnostic findings of a group of highly trained medical specialists, extensive laboratory tests, and a single meeting with the parents to inform them of the groups conclusions concerning the child. The other method, the "interaction model" with no more than 2 professionals in attendance, uses several interview sessions, "approaches interpretation through the questions raised by the parents, and... seeks to deal with their underlying concerns." It is concluded that the 1st method, though usually favorably received by other professional persons, fails to meet the needs of the parents, who often can neither comprehend nor believe information transmitted in a single session in a group setting.—*P. McMillan.*

2877. Towbin, Abraham. (Harvard Medical School, Boston, Mass.) *Mental retardation due to germinal matrix infarction.* *Science*, 1969(Apr), Vol. 164(3876), 156-161.—Describes "the transition between acute cerebral infarctional damage in the newborn and chronic encephaloclastic lesions in mental retardation." Over 600 clinically correlated cases were investigated. Whole-brain serial histologic sectioning allowed detailed pathologic analysis of the CNS. Results suggest that in both the fetus and newborn most cerebral lesions caused by hypoxia are infarctional in origin. Implications of these findings for improving clinical methods of management in premature delivery are presented. (22 ref.)—*P. McMillan.*

2878. Wilkerson, D. C. (Clearbrook Center, Rolling Meadows, Ill.) *The mentally retarded child: A psychological and child-care approach.* *Mental Retardation*, 1969(Dec), Vol. 7(6), 17-19.—Describes the principles and philosophy underlying a clinical program

for the intellectually disturbed, approaching it from a psychological and child care viewpoint. Many children labeled mentally retarded are cared for in institutions where the treatment programs stress the organic etiology of retardation. Experience with such children indicates that true intellectual potential asserts itself in a situation where the emphasis is not on training a retarded child, but on the development of a relationship within which the child can learn. Since the teacher is the most involved in the care of the child, focus should be on her therapeutic and educational skills.—*Journal abstract.*

Learning & Motor Ability

2879. Lambert Sue E. (U. Wisconsin) *The effect of white noise and rest interval on pursuit rotor learning in retardates.* *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5312.

2880. Shearer, William M. & Baud, Henry E. (Northern Illinois U., Speech & Hearing Clinic) *Adaptation in mentally retarded stutterers and non-stutterers.* *Journal of Communication Disorders*, 1970(Aug), Vol. 3(2), 118-122.—Observed speech adaptation rates in 8 mentally retarded stutterers and 12 nonstutterers to determine whether or not adaptation was consistently present in these groups, and to compare resulting adaptation behavior with that reported for normal and high IQ groups. Adaptation was found consistently in the mentally retarded groups and the influence of mental retardation upon this behavior was not evident. (15 ref.)—*Journal abstract.*

2881. Weisberg, Paul; Lieberman, Christiane, & Winter, Katherine. (U. Alabama) *Reduction of facial gestures through loss of token reinforcers.* *Psychological Reports*, 1970(Feb), Vol. 26(1), 227-230.—A procedure involving presentation of tokens, exchangeable for the opportunity to play a piano, which strengthened many appropriate work behaviors of a retardate in an occupational setting, failed to affect an attention-getting, distractable, facial gesture. The frequency of gesturing was drastically reduced when a deliberate contingency, token removal for gesture display, was superimposed on the above procedure. The simultaneous use of token delivery and token removal enabled the assessment of the tokens as conditioned reinforcers without causing disruptive behavioral effects which are possible with procedures wherein the back-up reinforcers are removed.—*Journal abstract.*

Training & Vocational Rehabilitation

2882. Becker, Ralph L. & Ferguson, Roy E. (Columbus State Inst. for the Mentally Retarded, O.) *Assessing educable retardates' vocational interest through a non-reading technique.* *Mental Retardation*, 1969(Dec), Vol. 7(6), 20-25.—Describes a reading-free vocational interest test for mildly retarded adolescent youth enrolled in a prevocational evaluation center at a state residential facility. Work areas on the grounds were observed for type, kind, methods, and materials used by job incumbents. A series of sketches of activities with occupational significance were prepared for males and females in booklet format. Preliminary administration of the instrument to 170 males and 113 females in the evaluation center gives strong evidence of the utility of this type of measurement in the guidance process. (15 ref.)—*Journal abstract.*

2883. Monaco, Theresa M., Fizer, Francis, & Sedge, Zelma. (Central Missouri State Coll.) **Pilot project: Housekeeping incentive plan.** *Central Missouri Synthesis on Mental Retardation*, 1968(Dec), Vol. 1(2), 12-14.—Tested the effectiveness of a monetary form of reward in developing quality control and speed associated with housekeeping tasks performed in cottages by 40 mentally retarded institutionalized females. CA ranged from 15 yr. through adulthood; MA ranged from untestable through high trainable. After a period of task orientation, the operant level of performance was determined prior to the introduction of the monetary form of reinforcement. An analysis of pre- and post-monetary performance indicates that quality and speed in performing specific cottage housekeeping tasks increased and remained consistent after the introduction of money as a reinforcing agent.—*Journal abstract.*

2884. Tsikoto, G. V. (Inst. of Defectology, Moscow, USSR) **O semeinom vospitanii umstvenno otstalogo rebënka rannego vozrasta.** [On training of the young mentally retarded child in the family.] *Defektologiya*, 1970, Vol. 2(1), 78-83.—Accompanied by practical suggestions and illustrative exercises, the training of young mentally retarded children at home is discussed, based on the work of A. Broner and F. Broner.—*I. D. London.*

2885. Twiehaus, John & Meinershagen, Joyce. (Central Missouri State Coll.) **Effectiveness of a home living program for institutionalized adolescent retardates.** *Central Missouri Synthesis on Mental Retardation*, 1968(Dec), Vol. 1(2), 15-18.—Gave 22 9-13 yr. old male retardates a 6-wk intensive program stressing social and self-care skills and a general knowledge of home living. Pre- and posttest results from 21 questions in the area of general living show that all but 1 S improved. It is concluded that such a program is beneficial, feasible, and should be adopted as part of the curriculum for adolescent institutionalized retardates.—*M. Maney.*

PHYSICAL ILLNESS

2886. Almajan, P. & Vintila, P. (Center of Cardiology, Bucharest, Romania) **Aspects psychologiques du patient coronarien.** [Psychological aspects of the coronary patient.] *Revue de Medecine psychosomatique*, 1970(Spring), Vol. 12(1), 65-71.—Compared coronary patients to a nonpatient population in an effort to determine differences in personality traits. The instruments used were clinical interviews, objective and projective tests. Patients were found to display significantly greater affectivity and aggression. Implications of these findings regarding early detection of future coronary patients are discussed. (30 ref.)—*R. Naar.*

2887. Bruch, Hilde. (Baylor U., Medical School, Houston, Tex.) **Juvenile obesity: Its course and outcome.** *International Psychiatry Clinics*, 1970, Vol. 7(1), 231-254.

2888. Hansotia, P., Harris, Ruth, & Kennedy, Jean. (National Hosp., London, England) **EEG changes in Wilson's disease.** *Electroencephalography & Clinical Neurophysiology*, 1969(Nov), Vol. 27(5), 523-528.—Correlated the EEGs of 23 patients and 5 asymptomatic siblings with Wilson's disease with their clinical states and biochemical studies related to liver function and copper metabolism. In uncomplicated cases of the disease the EEG may be normal or abnormal. When the

EEG is abnormal there does not appear to be a clear correlation with a clinical or biochemical state. Severely abnormal EEGs are seen with severe complications of the disease and are appropriate to the complication. These EEGs show improvement parallel with clinical improvement. Asymptomatic siblings with the characteristic biochemical defect of copper metabolism may also show normal or abnormal EEGs, a feature which seems to have a familial tendency. The abnormal EEGs of asymptomatic siblings show improvement with treatment, supporting the argument for prophylaxis in such cases. (French summary) (15 ref.)—*Journal summary.*

2889. Hornsby, L. G. **Ulcerative colitis: A contemporary overview.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 338-343.—Reviews the literature concerning etiology and treatment indications for chronic ulcerative colitis in both children and adults. No single cause (genetic, endocrine, allergic, infective, or psychogenic) has gained full acceptance. It is noted that emotional factors may either be predisposing to the illness or secondary once the illness is established. Treatment indications, ranging from surgery through psychotherapy, are discussed, and contraindications presented. Close team work between the internist, surgeon, and psychiatrist is stressed. (20 ref.)—*P. McMillan.*

2890. Kempf, John P. (State U. New York, Downstate Medical Center, Brooklyn) **Observations of the effects of kidney transplant on donors and recipients.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 323-325.—Describes psychological effects of renal homotransplantation on 37 15-44 yr. old recipients and their 15-59 yr. old donors. Psychological tests showed that although potential recipients became more optimistic after learning of the possibility of receiving a transplant, they remained preoccupied with thoughts of death and dying. Young recipient Ss reacted to their illness with more denial than older Ss, and many recipients felt guilt about receiving another's kidney, or felt that their illness was a punishment. Donors went through "a process of mourning" after surgery, with occasional depression or anxiety, caused in part by the fact that recipients could not live long. Both donors and recipients at times showed unconscious castration fears. No permanent impairment of psychological functioning occurred, however, in either donors or recipients as a result of transplant.—*P. McMillan.*

2891. Kolarov, S. A. (Inst. of Pediatrics, Moscow, USSR) **Vzaimootnoshenie struktury i funktsii pri funktsional'nykh zabollevaniyakh rebënka.** [Interrelationship of structure and function in functional diseases of the child.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 66-71.—Concludes that there is an independent group of diseases properly termed functional, but also recognizes that "functional diseases at their basis have a morphological substratum, localized at the level of the microstructure of the ailing organ."—*I. D. London.*

2892. Kowal-Gierczak, B., Fałowska-Adamczyk, W., & Hańczy, H. (Medical Academy, Wrocław, Poland) **Activity of salivary muramidase in allergic bronchial asthma.** *Polish Medical Journal*, 1969, Vol. 8(3), 584-588.—Determined the activity of salivary muramidase in various clinical states of allergic bronchial asthma in 126 16-64 yr. old Ss. All Ss with allergic bronchial asthma showed an increase of the enzyme activity. The highest enzyme level was found in status asthmaticus and in

asthmatic attack. The role of muramidase in allergic bronchial asthma is manifold. Since it has a lytic activity against micro-organisms it releases bacterial antigens and favors asthmatic attacks. On the other hand, its ability to bind histamine is likely to participate in the pathomechanism of bronchial asthma.—*Journal abstract.*

2893. Lüders, Hans; Kato, Motohiro, & Kuroiwa, Yoshigoro. (Kyushu U., Fukuoka, Japan) **Cortical evoked potentials in hepatolenticular degeneration.** *Electroencephalography & Clinical Neurophysiology*, 1969(Oct), Vol. 27(4), 425-428.—Studied somato-sensory and visual evoked potentials in 3 patients with hepatolenticular degeneration. In 1 S all of the components of the somato-sensory evoked potential were absent. In the other 2 Ss prominent alterations of N₁, P₁, and N₂ were observed. The visual evoked potentials were within normal limits in all Ss, except for the absence of rhythmic after-discharges. Findings suggest that somato-sensory evoked potentials are a more sensitive test than EEG in hepatolenticular degeneration. (French summary)—*Journal summary.*

2894. Markov, Kh. M. (Inst. of Pediatrics, Moscow, USSR) **Neirogennyye mekhanizmy patogeneza pochечноj gipertonii.** [Neurogenic mechanisms in the pathogenesis of renal hypertension.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(1), 87-95.—Presents a critical survey of primarily the non-Soviet literature, and discusses (a) the significance of the baroreceptor mechanisms, (b) the enhancement by angiotensin of the pressor effect of endogenous nor-adrenaline and the participation of the nervous system in the vasoconstrictive action of angiotensin, and (c) the significance of the cerebro-ischemic pressor mechanism. It is concluded that the "sympathetic nervous system and those changes of its functioning subjected to analysis [by the author] should be viewed as very essential and, possibly, determining, but, nevertheless, not the [1] single factor, but only as 1 of the components in the pathogenesis of chronic renal hypertension."—*I. D. London.*

2895. Nemtseev, G. I. & Kharon, N. S. (Research Inst. of Work Hygiene & Occupational Diseases, Kharkov, USSR) **Vremya zritel'nogo oshchushcheniya pri vozdeystvii terapevticheskikh doz rentgenovskikh luchei na diencefalo-gipofizarnuyu oblast'.** [Time of visual sensation under the action of therapeutic doses of roentgens on the diencephalo-hypophyseal region.] *Problemy Fiziologicheskoi Optiki*, 1969, Vol. 15, 72-76.—Investigated the "time of visual sensation" in 26 patients (17 endocrinal exophthalmia, and 9 optochiasmal arachnoiditis with disturbance of the visual functions). Under the influence of irradiation almost all Ss exhibited a reduction in "time of visual sensation." This is attributed to a decrease in the threshold of excitability of the interneuronal synapses in the optic pathway.—*I. D. London.*

2896. Rimón, Ranan; Lehtonen, Johannes, & Scheinin, T. M. (U. Turku, Finland) **Psychiatric disturbances after cardiovascular surgery.** *Diseases of the Nervous System*, 1970(May), Vol. 31(5), 326-328.—Investigated the psychiatric and social adjustment of 24 4-40 yr. old patients in whom psychopathological phenomena had occurred after major cardiovascular surgery. The mean duration of the observation was 3.2 yr. During the follow-up period, 6 Ss showed psychiatric symptoms: 3 had neurotic syndromes, 1 depression, 1 organic brain syndrome and 1 subnormal intelligence. In 4 cases these

symptoms caused partial incapacity and 2 were completely handicapped. 17 Ss accomplished good social adjustment and 9 showed improvement in general adaptation to social life after cardiac surgery. The significance of postoperative long-term psychiatric control and treatment is emphasized.—*Journal summary.*

2897. Serov, V. V. (1st Moscow Medical Inst., USSR) **Strukturno-funktsional'nye osnovy patologii pochek.** [Structuro-functional bases of renal pathology.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(3), 32-40.—Presents an analysis of structure and function, using data on the fine structure of the neuron, in order to develop an understanding of the renal pathological process.—*I. D. London.*

2898. Tambortsev, P. D. (Children's Clinical Sanatorium, Leningrad, USSR) **Fiziolopskhoprofilaktika khronicheskikh nespetsificheskikh pnevmonii u detei.** [Physiopsychoprophylaxis of chronic nonspecific pneumonias.] *Pediatriya*, 1970, Vol. 49(2), 92-93.—An analysis of the case histories of 5770 children led to their division into 2 groups, i.e., for Group 1, N = 4216, and for Group 2, N = 1554. Group 1 was decidedly inferior to Group 2, as indicated by a number of physical and emotional indices. The more normal life of Group 2 Ss suggests that the inferiority of those in Group 1 is due to the failure to undertake physio- and psychoprophylactic measures.—*I. D. London.*

2899. Tropauer, Alan; Franz, Martha N., & Dilgard, Victor W. (U. Cincinnati) **Psychological aspects of the care of children with cystic fibrosis.** *American Journal of Diseases of Children*, 1970, Vol. 119(5), 424-432.—Studied 20 children with cystic fibrosis and 23 mothers of such children using psychiatric interviews and the House-Tree-Person test. Results indicate emotional problems in both patients and mothers which if unresolved can impede medical therapy.—*A. B. Warren.*

2900. Wijsenbeek, H., Maoz, B., Nitzan, Ilanah, & Gill, Ruth. (Tel Aviv U., Medical School, Israel) **Ulcerative colitis: Psychiatric and psychological study of 22 patients.** *Psychiatria, Neurologia, Neurochirurgia*, 1968(Sep), Vol. 71(5), 409-420.

COMMUNITY SERVICES

2901. ———. **Hope for the family that is failing: A new dimension in the delivery of psychiatric care.** *Menninger Quarterly*, 1968-1969(Win), Vol. 22(4), 15-21.—Describes a community service project established to assist families in a low-income area who were failing in the basic tasks of feeding, clothing, and providing shelter. Results of 3 yr. of operation are described, focusing on findings involving what a psychiatrist, a clinical psychologist, and a social worker, working as a team and going into their clients' homes, have to offer this group of people and what techniques of helping prove most efficacious.—*M. Maney.*

2902. Beigel, Allan. (U. Arizona, Medical School) **Planning for the development of a community mental health center: I. Catchment area, administration, continuity of care, staffing and funding.** *Community Mental Health Journal*, 1970(Aug), Vol. 6(4), 267-275.—Discusses "the development of a community mental health center as described in federal legislation." Guidelines suggested for successful planning include: (a) sufficient funds from local organizations or individuals, (b) community support (the formation of a board of advisers of community leaders and potential consumers

is suggested), (c) priority evaluation of community needs, and (d) a knowledge of services currently being provided by other agencies so that duplication can be avoided. The administrative structure, continuity of care and records, staffing, and funding of a mental health center are also discussed. (42 ref.)—*P. McMillan*.

2903. Gottesfeld, Harry; Rhee, Chongik, & Parker, Glenn. (Roosevelt Hosp., New York, N.Y.) **A study of the role of paraprofessionals in community mental health.** *Community Mental Health Journal*, 1970(Aug), Vol. 6(4), 285-291.—Conducted a study of paraprofessionals in 10 New York institutions with mental health programs. 58 Ss were interviewed, including the director of the program, supervisor of paraprofessionals, 3 paraprofessionals, and 1 clinician in each institution. Data indicate that: (a) in the New York area, fewer paraprofessionals are utilized than in the rest of the nation; (b) their work overlaps with the professional; (c) many are involved in community organization and various forms of psychotherapy; (d) the paraprofessional contribution is perceived as "highly desirable" by administrators and clinicians; and (e) training and career opportunities for paraprofessionals are generally poor. Findings raise questions not only about the role and training of paraprofessionals but of professionals in community mental health.—*Journal abstract*.

2904. Gould, R. L. **Preventive psychiatry and the field theory of reality.** *Journal of the American Psychoanalytic Association*, 1970(Apr), Vol. 18(2), 440-461.—Community psychiatry is a public health venture that demands affecting individual internal systems by external social systems. Social reality is a force affecting the individual's internal equilibrium via a complex of channels regulating drive discharge by complementing ego structures. Reality operates as a series of signs mediating change demands or maintenance demands of structures. Concepts of structure-maintaining and structure-changing forces are equally useful in more fully understanding the individual as well as a society of individuals. (17 ref.)—*D. Prager*.

2905. Hersch, Charles. (Mental Health Center, Cambridge, Mass.) **The process of collaboration: II. Implementation and its discontents, or you don't learn that in school.** *Community Mental Health Journal*, 1970(Aug), Vol. 6(4), 300-312.—Describes the 2nd phase of a mental health program designed to help the poor. Phase I brought the collaborating groups to the point of a mutually endorsed plan. Phase II secured the funds needed to implement the program. Difficulties of this endeavor in the areas of community organization and political action are described. The strategies employed and unexpected obstacles encountered are emphasized.—*Journal abstract*.

2906. Sindberg, Ronald M. (Central Wisconsin Colony & Training School, Madison) **A fifteen-year follow-up study of community guidance clinic clients.** *Community Mental Health Journal*, 1970(Aug), Vol. 6(4), 319-324.—Conducted a 15-yr total sample follow-up study on 28 clients of a small general purpose community mental health clinic. Ss who received psychotherapy and those not receiving therapy had not initially differed significantly on a number of variables. Results indicate that although a higher proportion of the therapy group 15 yr. later showed no continuing emotional problems, and were more often happily married and steadily employed, the only statistically significant difference between groups was in subsequent

institutionalization which was much higher in the no-therapy group. For many therapy Ss the clinic apparently served a crisis intervention function, and clinic psychotherapy probably served as an alternative to institutionalization.—*Journal abstract*.

2907. Wolkon, George H. (Mental Health Rehabilitation & Research, Inc., Cleveland, O.) **Characteristics of clients and continuity of care into the community.** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 215-221.—Describes a study of 312 20-60 yr. old patients who were referred from psychiatric hospitals to a posthospital social rehabilitation center. $\frac{2}{3}$ of the Ss did not follow through on the referral. It was found that Ss who participated in the rehabilitation service were more dependent in several areas of functioning than those who did not participate. (18 ref.)—*Journal abstract*.

GERIATRICS

2908. Muller, C. (U. Lausanne, Switzerland) **Le problème de l'interférence des troubles de la sénescence avec les psychoses préexistantes.** [The problem of the interference of senile deterioration with preexisting psychoses.] *Encéphale*, 1970(Jan), Vol. 59(1), 81-89.—Reviews personality changes associated with senescence. Preexisting symptomatology seems less affected by senile changes than by the continuation of pathogenetic processes. The influence of cerebral-organic changes seems minimal, but the psychological changes associated with disengagement seem to have a greater effect.—*W. W. Meissner*.

2909. Schwartz, Ph. (State Hosp., Pathological Inst., Warren, Pa.) **Neue Beiträge zur Pathologie des Alterns: Fluoreszenzmikroskopische Untersuchungen.** [New contributions to the pathology of aging: Fluorescent microscopic investigation.] *Psychiatria et Neurologia*, 1967, Vol. 154(6), 337-365.—Describes a new method for the detection of amyloid deposits in tissues: treatment of histologic sections with thioflavine-S and viewing the preparations in ultraviolet light. It is emphasized that senile mental and physical deterioration is often caused by the accumulation of amyloid in the brain, cardiovascular system and pancreatic islets. Amyloidosis is the most common morphologically recognizable significant disease in human pathology. Cerebral, aortic and pancreatic insular amyloid degeneration in cases of mongoloid idiocy were found. Alzheimer's disease and pugilistic dementia were detected. Cerebral and cardiovascular amyloidosis, as observed in human pathology, also occurs in aged dogs. (4 p. ref.)—*English summary*.

2910. Speck, Peter W. (U. Birmingham, England) **Visiting in a female psycho-geriatric ward.** *British Journal of Psychiatry*, 1970(Jul), Vol. 117(536), 93-94.—Conducted a 7-day survey in a female psychogeriatric ward of 24 patients in order to collect information from 94 visitors concerning the value of their visit with a patient. A questionnaire was administered to elicit (a) factual information about visitors, (b) subjective accounts of their visiting behavior, and (c) their attitudes towards the hospital and visiting. A statistical test was made of the relationship between aspects of visiting behavior considered desirable by the investigator and the Ss' reported attitudes. Results suggest a ward-aid scheme in which visitors feel they take a more active part in the care of the patient.—*P. McMillan*.

2911. Whittingham, Senga, et al. (U. Melbourne,

Victoria, Australia) **Absence of brain antibodies in senile dementia.** *British Journal of Psychiatry*, 1970(Apr), Vol. 116(533), 447-448. —No antibody specific to brain antigens was detected in sera from 18 patients.—R. L. Sulzer.

EDUCATIONAL PSYCHOLOGY

2912. ———. **O rabote Pervogo soveshchaniya rektorov vysshikh uchebnykh zavedenii SSSR i GDR.** [On the work of the 1st Conference of Rectors of the Higher Educational Institutions of the USSR and the GDR.] *Vestnik Vysshei Shkoly*, 1970, Vol. 28(1), 90. —Presents an account of the 1969 conference, held in Berlin, E. Germany.—I. D. London.

2913. Baruchin, Fred. (State Education Dept., Albany, N.Y.) **Middle school for elementary youngsters? Maybe not!** *New York State Education*, 1967(Feb), Vol. 54(4), 44-47. —Argues that the rush to link "the elementary grades onto the middle school may not be justified and as scientifically based as its proponents make it seem...." —L. D. Summers.

2914. Centra, John A., Hartnett, Rodney T., & Peterson, Richard E. (Educational Testing Service, Princeton, N.J.) **Faculty views of institutional functioning: A new measure of college environments.** *Educational & Psychological Measurements*, 1970(Sum), Vol. 30(2), 405-416. —The Institutional Functioning Inventory (IFI) yields 11 scores. Among these are intellectual-esthetic extracurriculum, freedom, human diversity, and institutional esprit. IFI scales correlated with Astin variables as well as with scores on the College and University Environment Scales. The demonstrations of the validity of all scales are discussed.—N. M. Chansky.

2915. Edington, Everett D. (New Mexico State U.) **Disadvantaged rural youth.** *Review of Educational Research*, 1970(Feb), Vol. 40(1), 69-85. —A review of research relevant to characteristics of disadvantaged rural youth shows them disadvantaged in 7 different areas: socioeconomic status, low level of aspiration, attitudes nonsupportive of educational progress, educational achievement, inadequate and irrelevant curricula, and the wide spectrum of ethnic and cultural factors. Research is meager in the area, but the problems of the group under study are overlapping and interrelated to the general problems of education in this country. (2 p. ref.) —P. D. Leach.

2916. Erlich, M. **Research in classroom interaction and its implications for instruction.** *Hachinuch*, 1970(Jun), Vol. 42(5), 366-374.

2917. Graff, Robert W., & Bradshaw, Harley E. (Southern Illinois U., Counseling & Testing Center) **Relationship of a measure of self-actualization to dormitory assistant effectiveness.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 502-505. —Investigates the relationship between a measure of self-actualization and dormitory assistant effectiveness. The Personal Orientation Inventory (POI) was administered to 71 male undergraduate dormitory assistants. Effectiveness was measured by a semantic differential questionnaire in which students and personnel deans rated the assistants. Canonical correlations were used to explore the relationship between the POI variables and criterion measures. Results suggest that the POI may have value as a tool in the selection of dormitory assistants.—*Journal abstract*.

2918. Horne, Kibbey M. (Defense Language Inst., West Coast Branch, Monterey, Calif.) **Optimum class size for intensive language instruction.** *Modern Language Journal*, 1970(Mar), Vol. 54(3), 189-195.

—Reviewed past discussions and studies on optimum size of classes in foreign language instruction. It is suggested that a class size between 5 and 9 students constitutes the ideal. Justification for this class size revolved around the theories that (a) language is best learned as a small group activity rather than individually or on a mass basis, (b) with larger classes the students would not be allowed any speaking time, (c) students should be close enough to see and hear the instructor clearly (approximately 4-12 ft.), and (d) this size group enhances the atmosphere for informal group discussion.—C. O'Donnell.

2919. Howie, George. **Educational theory and practice of St. Augustine.** New York, N.Y.: Teachers Coll. Press, 1969, vi, 338 p. \$4.25(paper).

2920. Howie, George. **Psychological aspects.** In G. Howie, *Educational theory and practice of St. Augustine*. (See PA, Vol. 45:Issue 2) 63-98.

2921. Hruska, Jack L. (Michigan State U.) **An analysis of Paul Goodman's conception of the nature of man as a perspective on his educational proposals: A study in the philosophical foundations of radical educational thought.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5286-5287.

2922. Murphy, Maribeth L. (United States International U., San Diego, Calif.) **Measurement of values through responses to selected visual stimulus materials.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5294.

2923. Petrofesa, John J. (Wayne State U.) **A comparison of the personality need structure of college students enrolled in different academic majors.** *National Catholic Guidance Conference Journal*, 1970(Sum), Vol. 14(4), 218-228. —Ss were 854 upper-classmen and graduate students, under 25 yr. of age, of liberal arts and professional schools of a university. Data were need pattern scores of the EPPS. Need preference patterns of males and females in the various majors in the different schools were compared. It is concluded that: (a) "a fundamental relationship exists between the individual's personality needs and the college major he selects...." (b) Personality need patterns are relatively similar among the students in different areas of study in the same school.... (c) Differences among natural groups of both male and female Ss were in the expected directions.—A. M. Cawley.

ATTITUDE & ADJUSTMENT

2924. Adinolfi, Allen A. (Harvard U.) **Characteristics of highly accepted, highly rejected, and relatively unknown university freshmen.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 456-464. —Presents an empirical-descriptive study of personality, value, interest, social awareness, and interpersonal orientation variables associated with a sociometric status of high acceptance, high rejection, or relative anonymity of 297 male and 325 female freshmen undergraduates. A range of assessment techniques revealed differences among groups in needs expressed in interpersonal settings, in affectionate and inclusive social behavior, in interests, and in past dating behavior and

requests for current emotional counseling. Results indicate the anonymous student as defensive, self-protective, and emotionally uncomfortable; the highly accepted student as interpersonally rewarding; and the rejected student as interpersonally aversive. Regardless of objective social status all Ss felt accepted by others. Results are seen as means for helping anonymous and possibly rejected students establish a more satisfying interpersonal environment. (22 ref.) *Journal abstract.*

2925. **Baird, Leonard L., Richards, James M., & Shevel, Linda R.** (American Coll. Testing Program, Iowa City, Ia.) **A description of graduates of two-year colleges.** *ACT Research Report*, 1969(Jan), No. 28, 25 p.—Administered comprehensive follow-up survey to 2nd-yr students at 29 2-yr colleges. Ss responded to items regarding their background and plans, participation in nonacademic activities, financial and work status, and general satisfaction with college. The majority of Ss planned to transfer to 4-yr colleges. Ss were satisfied with most aspects of their instructors' performance, and described them as clear, factual, consistent, and concerned with their students. Ss participated in several areas of extracurricular activity, but seldom attained public recognition of their accomplishment. Most Ss worked part of their 2-yr college careers and commuted to campus. However, working or commuting were found to have little effect on college experiences or achievement. Graduates were generally satisfied with their 2-yr college. Some problems of 2-yr colleges were found to be real, others, e.g., student time spent in working or commuting, were not as great as expected. *Journal abstract.*

2926. **Cooley, Fannie R.** (U. Wisconsin) **Women doctoral students: Differential perceptions of their role behavior in the academic environment.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5228-5229.

2927. **Duerries, Lee E.** (U. Rhode Island) **Purpose in life and social participation.** *Journal of Individual Psychology*, 1970(May), Vol. 26(1), 50-53. 122 undergraduates took the Purpose in Life Test and completed a checklist of clubs, organizations, and community groups. High test scorers, as hypothesized, participated in more organizations than low scorers. Lack of support for hypothesizing that higher scores would be obtained by Ss who believed that their professor would evaluate their performance than Ss who felt that a graduate student was conducting a study in which they would remain anonymous was interpreted as contributing to the validity of the test.—*A. R. Howard.*

2928. **Fisher, Richard I.** (U. Kansas) **The effect of the academic self-concept and the method of problem presentation on problem solving performance.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5284.

2929. **Katkin, Steven.** (U. Georgia) **The relationship between professed values and emotional adjustment of college students.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5690.

2930. **Nelson, Charles M.** (U. Kansas) **Differences in measures of locus of control, evaluative style, incentive orientation, academic achievement, and overt behavior between conduct disturbed children and their peers in the regular classroom.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5295-5296.

2931. **Patterson, James P.** (U. Texas) **Correlates of**

student satisfaction in undergraduate educational psychology. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5297.

2932. **Sandven, John.** (U. Oslo, Inst. for Educational Research, Norway) **Students in general and school-rejecting students compared: Results of an investigation concerning relations to school and personality characteristics among 9th graders in the compulsory school.** *Scandinavian Journal of Educational Research*, 1968, No. 3-4, 91-140. Investigates the main characteristics in the students' relations to school, and compares findings for students in general with school-rejecting students, i.e., students who express a desire to leave school immediately if permitted. School-rejecting students were compared with other students with regard to: school achievement motivation, feeling of security, and problem-solving ability. The findings show that most students feel attached to school, like their work, and make efforts. School-rejecting students present a complex picture, but as a group they differ clearly from the others in their relations to school as well as in personality characteristics. *Journal abstract.*

2933. **Vikainen, Inkeri.** (U. Turku, Finland) **Attitudes as defence mechanisms of pupils with varying scholastic success.** *Scientia Paedagogica Experimentalis*, 1968, Vol. 5(1), 108-118. Gave attitude check lists to 1092 Finnish 4th graders. Although the correlation of school success and attitudes is often observed, it was found that the correlation was very low. Results are attributed to the fact that the negative attitudes of weaker pupils towards school and teachers are weaker not stronger than average. "A further study is being made of how different attitudes are reflected in the behaviour of different school-success groups." (German summary)—*A. M. Berg.*

2934. **Weilman, Robert E.** **Psychological growth and openness to learning in secular and parochial colleges.** *National Catholic Guidance Conference Journal*, 1970(Sum), Vol. 14(4), 256-262. Compared realistic personal values of students attending different kinds of colleges in an attempt to answer the question "Does college experience help students learn to confront human problems effectively?" The measuring instrument consisting of 20 statements requiring choice among 4 levels of approval, was adapted from the kinds of problems that bring students to the counseling situation. Ss were samples from the freshmen and senior students of 3 Catholic women's colleges, 1 Catholic men's college, and 1 private and 1 state coeducational college. Results suggest that a substantial percentage of the sample lack awareness of a realistic attitude that would assist them to live a creative human existence despite evidence of limited favorable movement among Catholic college students.—*A. M. Cowley.*

2935. **Wolffenden, John.** (British Museum, London, England) **Students' strains and stresses.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 577-585.—As part of the price of growing up, young people have always suffered from stresses and strains. While some have thought that the relative affluence of today makes the lot of the young easy, other differences from the past increase strain, including the "focus on youth" attitude, personal problems generated in part by the passion for honesty and sincerity, the loss of conventions and other simple guidelines to behavior, and the revolutionary ethos of "smash the system." It is concluded that the unhappiness behind the desire to smash has

roots in a profound disillusion with internal, domestic, national policies, and in a deep concern about the great causes.—R. L. Sulzer.

2936. Wright, Logan & Dunn, Thomas. (U. Oklahoma, Medical Center, Oklahoma City) **Factor structure of the Expanded Sociometric Device: A measure of personal effectiveness.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 319-326.—The Expanded Sociometric Device was administered to 88 female and to 168 male college student members of Greek societies. 4 factors were extracted from the factor analysis of item intercorrelations: perceptual and task effectiveness, autonomy and self-actualization, commitment, and openness. These findings were replicated on a 2nd sample of 393 Ss from the same university. Findings were partially replicated for fraternity and sorority Ss of the 2nd sample.—N. M. Chansky.

TESTING

2937. Achenbach, Thomas M. (Yale U.) **The Children's Associative Responding Test: A possible alternative to group IQ tests.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 340-348.—308 5th graders took the Children's Associative Responding Test (CART), a previously standardized and validated multiple-choice analogy test designed to identify children who rely on free association rather than on reasoning processes which may be available to them. 2 experiments replicated previous findings that the correlations between classroom performance and ability measures (Otis and Binet IQ, mental age) were lower for children who, on the CART, relied excessively upon free association (high Ds) than for children who did not (low Ds). High Ds were significantly poorer than low Ds on an individual paired-associate task, but not on content-free problem-solving tasks. Unlike the Otis and Binet, total errors on the CART had consistently high correlations with classroom performance for all groups.—*Journal abstract*.

2938. Baggaley, Andrew R., Isard, Eleanore S., & Sherwood, Emily J. (U. Pennsylvania) **Discrimination of academic curricula by the Runner Studies of Attitude Patterns, College Form.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(1), 41-44.—All freshmen entering a large urban university completed the college form of the Runner Studies of Attitude Patterns (RSAP). 2 yr. later, 628 of these students had attained junior status and had selected academic majors. Multiple-discriminant analysis was applied to the 10 personality variables of the RSAP and to 17 groups of academic majors. The hypothesis of equality of population centroids for the 17 groups was rejected at the .01 level. The 1st 2 latent roots accounted for 55% of the discrimination. The 2 discriminants were identified as need for exploring new ideas and competitive tendency.—S. M. Amatora.

2939. Bracht, Glenn H. & Hopkins, Kenneth D. (Southern Illinois U.) **The communality of essay and objective tests of academic achievement.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 359-364.—An essay and a multiple-choice test were administered to 279 undergraduate sophomores. Items for both tests were based on similar assigned content. The Kuder-Richardson Formula 20 reliability for the objective test were .4 and .5; for essay, .3 and .7. When allowances were made for the unreliability in the tests, all intercorrelations between essay and objective

tests were approximately .9. (15 ref.)—N. M. Chansky.

2940. Brown, Frederick G. (Iowa State U.) **Review of the past, focus for the future.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(1), 18-24.—Views A. R. Jensen's (see PA, Vol. 43:9740) report as reemphasizing many of the persistent problems of psychological measurement rather than as raising a new set of issues. In particular, it forces test developers and users to consider: (a) the multiplicity of determiners of test performance, (b) the central role of the norming population in test interpretation, (c) whether tests measure basic psychological traits or are only decision-making aids, (d) the diversity of human abilities and possible tests, and (e) the adequacy of the present model for conceptualizing test performance. Attention is also directed to the social consequences of testing.—S. M. Amatora.

2941. Cameron, Howard K. (Howard U.) **Cultural myopia.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(1), 10-17.—The controversy resulting from A. R. Jensen's (see PA, Vol. 43:9740) report is viewed in terms of the questionable usefulness and applicability of standardized tests in measuring personality attributes of minority group Ss. A moratorium on testing minority group members with existing standardized measuring instruments, accompanied by a reassessment of the validity of standardized tests and an ethical appraisal of testing practices with minority groups whose cultural backgrounds vary significantly from that of the middle-class white norm is recommended. There must be lessened emphasis on the predictive aspects of cognitively based tests, increased emphasis on their diagnostic value, and greater professional attention to researching nonintellectual predictors of behavior.—S. M. Amatora.

2942. Carr, George L. (Cornell U.) **The development, construction, and validation of a test of problem-solving ability in physical science for use with nonscience majors in college.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5279-5280.

2943. Cole, Nancy S. (American Coll. Testing Program, Iowa City, Ia.) **Differential validity in the ACT tests.** *ACT Research Report*, 1969(Aug), No. 30, 8 p.—Investigates the differential validity of subject area tests of academic ability. Principal components analyses of test scores, and high school and college grades in English, math, social studies, and natural sciences show a dominant general ability dimension and a consistent configuration of subject areas on 2nd and 3rd dimensions. Data from 250 colleges yield correlations of subject area college grades with subject area test scores on the American College Tests (ACT) and with high school grades. A criterion of differential validity is proposed and calculated for the ACT tests and high school grades in predicting college grades. The moderate differential validity found is interpreted in terms of the 1st analysis.—*Journal abstract*.

2944. Costin, Frank. (U. Illinois) **The optimal number of alternatives in multiple-choice achievement tests: Some empirical evidence for a mathematical proof.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 353-358.—Presents empirical evidence which supports Tversky's mathematical proof that a 3-choice multiple-choice test is more powerful than a 4-choice test. Power refers to 1 minus the p of attaining a perfect performance by chance alone. 3-choice items were slightly easier and more discriminating than 4-choice items.—N. M. Chansky.

2945. Debyser, R. & Jennen, J. (Royal Military School, Brussels, Belgium) **Une batterie de tests d'intelligence destinée à des étudiants du niveau de l'enseignement supérieur.** [A battery of intelligence tests for college students.] *Information Psychologique*, 1969(May), No. 34, 34, 39-80.—8 tests including the Progressive Matrices and the Dominoes Test were administered to 111 students at the Royal Military School, Brussels, Belgium. Means, standard deviations, and intercorrelations are reported as well as the results of factor analyses. Correlations with school success are not reported.—S. G. Vandenberg.

2946. Dreyer, Dorothy E. (Michigan State U.) **Listening performance related to selected academic and psychological measures.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5735.

2947. Goolsby, Thomas M. (U. Georgia) **The validity of the College Level Examinations Programs tests for use at the college sophomore level.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 375-380.—The College Level Examination Program was administered to 2 samples at the end of the sophomore year. Intercorrelations between the subtests are presented. Given also are correlations of subtest scores with sophomore and with junior GPA. Correlations were moderate. They were interpreted to be too low for predictive purposes.—N. M. Chansky.

2948. Goolsby, Thomas M. & Frary, Robert B. (U. Georgia) **Validity of the Metropolitan Readiness Test for white and Negro students in a southern city.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 443-450.—A battery of tests including the Metropolitan Readiness Test (MRT), the Otis-Lennon Mental Ability Test, the Metropolitan Achievement Tests, and the Botel Reading Inventory were administered to children in integrated and segregated schools. Intercorrelations between the tests were computed. Correlations of MRT with subsequent achievement tended to be higher among Negroes. Factor analyses of the data from the 2 races revealed similar factors. Factor 1 had more MRT loadings in the Negro than in the Caucasian group.—N. M. Chansky.

2949. Hanna, Gerald S. (Kansas State U.) **Influence of directions regarding guessing on validity.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(1), 35-40.—4 psychometric and 2 ethical issues concerning test directions regarding guessing and the use of scoring formulas were identified. Most standardized tests of maximum performance ignore the warning against scoring on the basis of number right in the absence of power-testing conditions and instructions to mark every item. The validity concomitants of 4 sets of directions regarding guessing were investigated with a sample of high school geometry students. The most valid procedures were testing with directions indicating or implying the use of a scoring formula, and scoring by means of either conventional or multiple-regression formulas.—S. M. Amatora.

2950. Lunneborg, Clifford E., Greenmun, Renny, & Lunneborg, Patricia W. (U. Washington) **A factor analysis of the core elements of the CEEB Comparative Guidance and Placement Battery.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 387-392.—The Comparative Guidance and Placement Battery (CGPB) was administered to 687 community college entrants. The 20 measures obtained from the CGPB were factor analyzed. 6 factors accounted for

72% of the variance: verbal skill, verbal interest, scientific interest, business interest, fine arts, and mechanical perceptual factors.—N. M. Chansky.

2951. Ostyn, N. (Royal Military School, Brussels, Belgium) **Ijkingen van de intelligentietest voor ruimteverhoudingen.** [Standardizing the spatial relations test of Gedeon for 19-22 year old boys.] *PMS: Tijdschrift voor Psycho-Medisch-Sociaal Werk*, 1970, Vol. 16(1), 27-31.—Norms are given for Gedeon's French-Canadian test of spatial relations based on 4 groups with different amounts of education: university level, 191; technical education, 595; high school diploma, 1377; and 6 yr. of education, 949.—S. G. Vandenberg.

2952. Payne, Paul A. (U. Cincinnati) **Meanwhile, back at the items . . . Measurement & Evaluation in Guidance**, 1970, Vol. 3(1), 28-34.—Presents an approach to test interpretation which involves the selected use of scale items. Examples are given of situations for such item utilization that could have appreciable effects on conclusions reached. Procedures are described for making use of scale items in a more practical manner in interpretation.—S. M. Amatora.

2953. Pennscott, William W. & Sorensen, Mourits A. (Clemson U.) **OAIS achiever personality and desire for improvement in reading and study skills.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(1), 25-27.—Assesses the validity of the Achiever Personality (AP) scale of the Opinion, Attitude, and Interest Survey (OAIS), using a behavioral criterion. 130 volunteer students on a reading and study skills program were matched with 130 nonvolunteers on the basis of sex and scores on the Davis Reading Test. Groups were compared on their AP scale scores. Volunteers' AP scores were correlated with the number of hr. they remained on the program. AP scale scores of the volunteers were found to be significantly higher than those of nonvolunteers; and persistence in the program and AP scale scores were significantly related. Results tend to support the statement in the OAIS manual describing the AP scale as a measure of motivation and conscientiousness.—S. M. Amatora.

2954. Poole, Richard L. (Syracuse U.) **An examination of cognitive processes elicited by test items as a function of the taxonomy of educational objectives and selected cognitive factor abilities.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5298-5299.

2955. Pounders, Cedric J. (U. Southern California) **The Admissions Test for Graduate Study in Business: A factor analytic study.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 469-473.—4 factors were extracted from a factor analysis of the Admissions Test for Graduate Study in Business administered to 102 business students whose verbal and quantitative ability was slightly above the national average. These factors were numerical facility, verbal comprehension, abstract reasoning, and perceptual speed.—N. M. Chansky.

2956. Shand, Jack. (Gettysburg Coll.) **The Graduate Record Examination Advanced Test in Psychology in relation to undergraduate academic standing.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 85-90.—Indicated difficulties in the predictive validation of the Graduate Record Examinations (GRE) using existing procedures and prevalent criteria of success in graduate school. A method of concurrent validation (based on correlation of the GRE Advanced Test in Psychology

with undergraduate psychology quality point average) was used for each of 5 successive yr. ($N > 30$ for each yr.), and yielded consistently higher correlations (near .50) than those commonly reported in the literature for the correlation of either GRE-V, GRE-Q, or the GRE Advanced Test in Psychology scores with various criteria of success in graduate work in psychology.—*Journal summary*.

2957. Warries, E. (Research Inst. voor de Toegepaste Psychologie, Amsterdam, Netherlands) **Het relatief meten van leerprestaties in het onderwijs.** [The relative measurement of learning-achievement in the process of instruction.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jun), Vol. 25(6), 429-439.—Discusses the merits of the normative vs. absolute standards of achievement. The defects of the normative approach are that (a) the bases for grading vary too widely among classes and teachers for the prediction of the pupil's later progress, (b) an undue emphasis is placed on differentiation among the pupils, and (c) that the communicative values of teachers' marks are frequently spurious. Absolute measurement is preferable for small groups that are being measured by teacher made tests. The normative approach to grading, if taken seriously, underlies the mistaken concept that a certain proportion of the pupils are destined to fail.—A. J. Ter Keurst.

2958. Wasik, John L. & Wasik, Barbara H. (North Carolina State U.) **A note on use of the WPPSI in evaluating intervention programs.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(1), 54-56.—A study of the test-retest data used to provide stability estimates of the Wechsler Preschool and Primary Scales of Intelligence (WPPSI) showed a consistent positive gain in performance from the 1st to the 2nd testing. The difficulty of interpreting gains on the WPPSI to demonstrate the effectiveness of preschool intervention programs is discussed. A procedure is presented allowing true estimates of the effectiveness of intervention programs when the WPPSI is used as the evaluative measure.—S. M. Amatora.

2959. Zaretskii, L. M. (Provincial Pedagogical Inst., Moscow, USSR) **O chisle otvetov k zadaniyam pri programmirovannom kontrole.** [On the number of answers to problems in programed checking.] *Vestnik Vysshei Shkoly*, 1970, Vol. 28(2), 34-39.—Presents a technical analysis of how the number of choices listed as possible answers to a problem influences the checking process, in order to determine the optimal number of choices.—I. D. London.

2960. Zimmerman, Wayne S., Michael, Joan J., & Michael, William B. (California State Coll., Los Angeles) **The factored dimensions of the Study Attitudes and Methods Survey Test-Experimental Form.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 433-436.—The test was administered to 91 college freshmen and to 320 high school students in the college community. More interpretable factors were extracted from the high school sample. Among the factors named were learning affect-satisfaction, persistence-conformity, self-assurance, and systematic study.—N. M. Chansky.

SPECIAL EDUCATION

2961. Carlson, Ralph M. (U. Oregon, School of Education) **Behavior modification: Educational im-**

plications. *Journal of Learning Disabilities*, 1968(Sep), Vol. 1(9), 515-519.—Clarifies the origin and meaning of behavior modification and shows how it relates to the teaching process. A task analytic approach to the education of the emotionally disturbed and neurologically handicapped is outlined, analyzing where the educational process has failed. It is emphasized that it is "the teacher's rightful domain to structure the classroom environment in such a way so as to produce the desired behavior."—M. Maney.

2962. Crosson, James E. (U. Oregon) **The functional analysis of behavior: A technology for special education practices.** *Mental Retardation*, 1969(Aug), Vol. 7(4), 15-18, 45.—Deals with the science of behavior from the viewpoint of Special Education. Fundamental principles of operant behavior are presented in terms of their role as important tools for the practitioner and described in relation to common examples of behavior. Procedures for analyzing and modifying behaviors are discussed and typical applications are described. Selected references are included as guides to additional information.—*Journal abstract*.

2963. Quadfasel, F. A. & Goodglass, H. **Specific reading disability and other specific disabilities.** *Journal of Learning Disabilities*, 1968(Oct), Vol. 1(10), 590-600.—Deals with the conflicting views concerning the nature of reading disabilities by developing the propositions that: (a) "most cases of reading retardation must be understood in the context of variations in talent from the acquisition of special skills, however the population of reading retardates also includes cases caused by brain injury"; (b) "inferiority in learning endowment for specific skills reflects functional inefficiency in the brain structures underlying these skills and may present symptoms like those occurring with actual injury"; (c) "distinctive errors of reading and spelling, accompanied by perceptual motor test deficits ... are found in a subgroup of reading retardates [and] examination should always test for these deficits"; and (d) "emotional factors are usually secondary to an initial deficiency in learning ability and remedial reading instruction is normally the treatment of choice." Different views regarding specific disabilities among the various disciplines are discussed and a system of diagnostic classification is proposed on the etiology. (18 ref.)—M. Maney.

2964. Wasik, Barbara H. (U. North Carolina, School of Education) **The application of Premack's generalization on reinforcement to the management of classroom behavior.** *Journal of Experimental Child Psychology*, 1970(Aug), Vol. 10(1), 33-43.—Successfully employed a behavior management procedure in a demonstration school for culturally deprived children to increase appropriate behavior in a 2nd-grade classroom. A free-choice activity time was introduced into the classroom and access to this activity was made contingent upon the prior occurrence of desirable behavior. Data were collected on 19 children twice a day in an individual work time and in a group work time and were coded according to a classroom behavior analysis schedule. There were 4 experimental conditions: Base line I (prior to the contingency conditions), Modification I (free-choice activity time contingent upon the occurrence of appropriate classroom behavior), Base line II (removal of the contingent activity time), and Modification II (reintroduction of the contingent activity time). In both classroom functions, the average per-

centage of desirable classroom behavior increased during Modification I when compared with Base line I levels. These behaviors decreased when the contingent activity time was removed, but increased again during the reintroduction of the contingency phase. (23 ref.)—*Journal abstract.*

Gifted

2965. Ziv, A. T. **The need to foster gifted children.** *Hachinuch*, 1970(Jun), Vol. 42(5), 332-338.—Reviews the identification, testing, and education of exceptional children. (25 ref.)—*M. Moore.*

Remedial Education

2966. Blau, Harold & Blau, Harriet. (Reading & Tutoring Inst., Jamaica, N.Y.) **A theory of learning to read.** *Reading Teacher*, 1968(Nov), Vol. 22(2), 126-129, 144.—Presents an alternate approach to the multisensory visual-auditory-kinesthetic-tactile (VAKT) method for teaching severely handicapped readers. The corollary to the hypotheses that there is: (a) "no interference or short-circuiting from the visual modality or input system in the learning of speech," and (b) "maximum destructive interference from the visual modality or input system in the learning of reading," is that visual input must be blocked off. The nonvisual AKT method is illustrated by a case report of an 8-yr-old boy of normal intelligence, but with difficulties in visual perception, behavior and motor areas. It is felt that there are a number of children, "classified as reluctant or non-learners, who really suffer from a kind of modality conflict and for whom instruction centering around modality blocking may be required prior to . . . any other program for the amelioration of their difficulties."—*G. Steele.*

2967. Brottman, M. (Ed.) **Language remediation for the disadvantaged preschool child.** *Monographs of the Society for Research in Child Development*, 1968, Vol. 33(8), 83 p.—Contains a selected collection of articles on language remediation, with particular emphasis upon curriculum development.—*A. Barclay.*

2968. Edelstein, Ruth R. (Syracuse U.) **Use of group processes in teaching retarded readers.** *Reading Teacher*, 1970(Jan), Vol. 23(4), 318-324, 393.—Compared and contrasted observations on: (a) small educational groups conducted twice a wk. for 4th graders of average intelligence who were 1-1½ yr. retarded in reading, and (b) therapy groups for children with emotional problems not manageable in the educational groups. Educational groups were characterized by cooperative group norms determined by the teacher, rapid establishment of instrumental goals, and students who saw the structure of the group in a variety of ways. Therapy groups were characterized by competitive group norms established by the students, slower establishment of expressive goals, and students who saw the group as a club or family. In both groups adult emulation contributed to the development of leaders. Group cohesiveness was found to be more predominant in schools which had educational groups but no therapy groups. Implications for combined therapy and instruction groups are discussed.—*R. Wiltz.*

2969. Lindquist, Mary L. (U. Wisconsin) **Teaching specific skills in language and cognition to disad-**

vantaged preschoolers. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5289-5290.

2970. Lipton, Aaron. (State U. New York, Stony Brook) **Relating remedial strategies to diagnostic considerations.** *Reading Teacher*, 1970(Jan), Vol. 23(4), 353-359.—Suggests that remedial reading programs can utilize information gained from exploration of the underlying language, emotional, socioeconomic, physiological, and neurological factors that produce reading disabilities. Case studies of an 8-yr-old and a 9-yr-old boy are discussed "in reference to diagnostic considerations as they related to strategies of remediation." It is concluded that the uniqueness of individuals and the strategies for remediation can be brought into focus by "initial and on-going diagnosis of each child in reference to his position in the family constellation, his intrapsychic dynamics, his learning styles, his attitudes towards learning, his feelings about himself and adults, and his perception of his place in the school setting."—*R. Wiltz.*

2971. Mann, Lester. **Perceptual training: Misdirections and redirections.** *American Journal of Orthopsychiatry*, 1970(Jan), Vol. 40(1), 30-38.—Examines perceptual-motor training as an educational fad. Perceptual-motor training is of value in traditional adapted educational and therapeutic approaches directed toward functional and relevant behavioral objectives, rather than toward isolated perceptual improvements. (22 ref.)—*Journal abstract.*

2972. Reed, James C. (Tufts U., Medical School) **The deficits of retarded readers: Fact or artifact?** *Reading Teacher*, 1970(Jan), Vol. 23(4), 347-352, 393.—Attempts to show "that the pattern of deficits found among retarded readers will depend upon the index used to estimate reading potential . . ." 69 5th graders scoring in the bottom 3rd of the class on the Iowa Silent Reading Test (ISRT) and Gates Diagnostic Survey Test (GDST) were assigned to 1 or more of 3 groups containing Ss with: (a) WISC Full Scale (FS) IQs above 90, (b) WISC Verbal (V) IQs above 90, or (c) WISC Performance (P) IQs above 90. Ss were paired on the basis of the identifying group factor (FSIQ, VIQ, or PIQ) to a "good reader" scoring in the upper 2½ of the class on the ISRT and GDST. Results indicate that: (a) Ss matched for FSIQ significantly differed in VIQ and PIQ, (b) Ss matched for VIQ did not differ in FSIQ or PIQ, and (c) Ss matched for PIQ significantly differed in FSIQ and VIQ. Administration of a battery of neuropsychological tests to all Ss revealed that "the frequency with which the good and poor readers scored below the 25th percentile rank depended on how they were paired." It is concluded that the "modality deficiencies, the cognitive deficits, the aptitude weaknesses, and the relation of verbal to performance abilities will vary according to the method of identifying the retarded reader."—*R. Wiltz.*

2973. Waldman, Marvin. (Hahnemann Medical Coll. & Hosp., Philadelphia, Pa.) **Psychodynamics and educational orientation in the special school.** *Reading Teacher*, 1970(Jan), Vol. 23(4), 325-330, 359.—Focuses on approaches that could make teaching of children with severe reading disabilities more effective. A disadvantage of special schools is the lack of attention paid to psychodynamic factors. A psychotherapist within the school setting can aid the children in crisis states and assist the teacher in developing stratagems of coping with specific problems. The teacher, in the role of a "learning therapist," can learn to aid the children by teaching them

to label their feelings and by communicating to the child an "empathic awareness of his role in relation to others."—R. Wiltz.

Sensory & Physical Handicaps

2974. Apraushev, A. V. & Leonova, R. A. (Children's Home for the Blind Deaf-Mute, Zagorsk, USSR) **Opyt programmirovannogo obucheniya slepoglukhikh detei slovesnomu udaren'yu.** [Experience with programmed teaching of verbal stress to blind-deaf children.] *Defektologiya*, 1970, Vol. 2(1), 53-57.—Presents results of research on teaching syllabic accent to blind-deaf children, making use of a teaching machine.—I. D. London.

2975. Apraushev, A. V. & Leonova, R. A. (Children's Home for the Blind Deaf-Mute, Zagorsk, USSR) **Opyt programmirovannogo obucheniya slepoglukhikh detei slovesnomu udaren'yu.** [Experience with programmed teaching of verbal stress to blind-deaf children.] *Defektologiya*, 1970, Vol. 2(1), 53-57.—Presents results of research on teaching syllabic accent to blind-deaf children, making use of a teaching machine.—I. D. London.

2976. Boskis, R. M. **Amerikanskije surdopedagogi daktilologii.** [American surdopedagogues on dactylology.] *Defektologiya*, 1970, Vol. 2(1), 63-69.—Presents summaries of 2 papers by J. H. Galloway and E. L. Scouten, respectively, on the Rochester method of finger spelling in teaching speech to deaf children, and the full Russian translation of these papers which were read at the 1963 International Congress on Education of the Deaf, held in Washington, D.C.—I. D. London.

2977. Grebel'naya, N. A. (Leningrad State Pedagogical Inst., USSR) **Pervye rezul'taty obucheniya slepykh detei po eksperimental'noi programme na urokakh matematiki.** [First results of teaching blind children by utilizing an experimental program in mathematics lessons.] *Defektologiya*, 1970, Vol. 2(1), 34-39.—Reports the findings of research on the teaching of arithmetic to blind children in the 1st 4 grades of the special school, making use of an experimental program reflecting the new program of mathematics introduced into the regular Soviet school.—I. D. London.

2978. Morin, Edward A. (Portland State U.) **Programmed instruction: Today's challenge in educating visually handicapped.** *Education of the Visually Handicapped*, 1970(Mar), Vol. 2(1), 8-11.—As a result of the lack of sufficient personnel trained to teach the visually handicapped, new and more efficient methods of teaching have been sought. The contributions of the programmed instruction method of teaching and learning are related to the fact that "it is a systematic method of teaching which is based on a rational theory of learning." A definite method of information presentation and for skill development is available, thereby facilitating a more accurate objective measurement and evaluation of performance. Predictable results of programmed instruction appear to be consistent, and these methods are deemed as being one of the most favorable prospects.—P. R. Shibelski.

2979. Tobin, M. J., Clarke, D., Lane, I., & Pittam, V. G. (U. Birmingham, School of Education, England) **Programmed learning for the blind: Some exploratory studies.** *Education of the Visually Handicapped*, 1970(Mar), Vol. 2(1), 11-23.—Attempted to ascertain the value of programmed learning for the visually handicapped. 6 experimental programs covering 2

areas—Braille teaching and science, and social teaching—were tested on varied groups of visually handicapped and blindfolded Ss. Results of the 1st experimental program, teaching Braille words, showed that the programed Ss scored higher than did those Ss who were taught by conventional methods. 2 other programs concerned with learning comprehension achieved similar success with the program method. 2 programs (dealing with a social problem and basic scientific experimentation) similarly showed decisive success. Programed learning can be administered effectively at a teacher-paced and individual-paced level with a high degree of success in a variety of subject matters.—P. R. Shibelski.

2980. Zudova, V. F., Koryakin, B. T., & Khmyrov, S. B. **Sel'skokhozyaistvennyi trud v shkole-internate diya slabovidyashchikh.** [Farm labor in the boarding-school for the visually handicapped.] *Defektologiya*, 1970, Vol. 2(1), 39-46.—Discusses an experimental program in differentiated teaching of farming skills to visually handicapped children in the 5th-8th grades of the special school.—I. D. London.

Mental Retardation & Learning Disorder

2981. Abrams, Jules C. (Hahnemann Medical Coll. & Hosp., Philadelphia, Pa.) **Learning disabilities: A complex phenomenon.** *Reading Teacher*, 1970(Jan), Vol. 23(4), 299-303, 367.—Argues that since many different factors are associated with learning disabilities, the teacher must focus upon the whole child. To do this, the teacher can "evaluate the ego status of the child . . ." Diagnoses of the ego functioning of children with: (a) brain damage, (b) dyslexia, (c) environmental and reactive problems, and (d) neurotic factors, are presented and discussed.—R. Wiltz.

2982. Abrams, Jules C. (Hahnemann Medical Coll. & Hosp., Philadelphia, Pa.) **Parental dynamics: Their role in learning disabilities.** *Reading Teacher*, 1970(May), Vol. 23(8), 751-755, 760.—Suggests that it is advantageous to consider the learning disabled child within the context of family relationships. A description of a 9-yr-old boy with an overprotective mother is used to illustrate the contention that parents of brain-damaged children often erect defenses, in the form of overprotection, against anger and hostility impulses produced by guilt feelings. In another illustration, it is demonstrated that parents of dyslexic children often find it difficult to accept the fact that the child has a problem. In both cases the child develops severe feelings of inadequacy. The necessity of informing the parents of the nature and emotional ramifications of the child's difficulty is emphasized. It is concluded that "parental dynamics play a very important role in the formulation or exacerbation of any learning disability."—R. Wiltz.

2983. Barham, Jimmie F. (East Texas State U.) **A study of the Troth-Walker PCR form as a predictive instrument for identification of elementary pupils with learning disabilities.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5276.

2984. Bricklin, Patricia M. (Hahnemann Medical Coll. & Hosp., Philadelphia, Pa.) **Counseling parents of children with learning disabilities.** *Reading Teacher*, 1970(Jan), Vol. 23(4), 331-338.—Describes a program of parent-counseling sessions conducted with parents of children with learning disabilities. The program is designed to: (a) provide information concerning disabilities, (b) provide a liaison between home and school,

(c) aid parents in understanding their children's feelings and behavior, (d) aid parents in developing a total approach to the child's behavior, and (e) provide parents with the opportunity to determine whether or not they themselves wish to seek psychotherapy. Independent discussions with parents and teachers involved in such a program indicate that both groups felt they had increased their ability to: (a) see the children from different perspectives, (b) know that everyone is struggling with the same things, (c) understand the sources of daily stress, (d) know the extent of responsibility for the child's behavior, (e) evaluate the truth of the child's statements, and (f) set more effective limits.—*R. Wiltz.*

2985. **Dul'nev, G. M.** (Inst. of Defectology, Moscow, USSR) *K voprosu o differentsiatsii obucheniya uchashchikhhsya vspomogatel'noi shkoly.* [On the problem of differentiation of the teaching of pupils in the auxiliary school.] *Defektologiya*, 1970, Vol. 2(1), 8-13.—Attempts to show that, regardless of the measures taken to ensure the best selection of pupils for proper placement in schools for the mentally retarded, student composition will remain heterogeneous and the problem of a differentiated approach to teaching will continue to be one of "unusual acuteness."—*J. D. London.*

2986. **Gaddes, William H.** (U. Victoria, British Columbia, Canada) *A neuropsychological approach to learning disorders.* *Journal of Learning Disabilities*, 1968(Sep), Vol. 1(9), 523-534.—Presents a proposal to integrate neurological, psychological, and educational knowledge in the diagnostic understanding and educational planning of children with learning disorders. It is argued that teachers of special classes can no longer ignore or avoid an understanding of the neurological aspects of the children they teach with the claim that this knowledge is irrelevant or unimportant to their task. A brief description of how this proposed method operates in a university neuropsychology laboratory is presented.—*Journal abstract.*

2987. **Gever, Benson E.** (Hahemann Medical Coll. & Hosp., Philadelphia, Pa.) *Failure and learning disability.* *Reading Teacher*, 1970(Jan), Vol. 23(4), 311-317.—Suggests that learning disabilities are maintained by an ever increasing ratio of failure to success. Examples are cited to illustrate that repeated failures produce an emotional state, consisting of discomfort, tension, and anxiety, which in turn produces further failures. Other reactions to failure, including aggression, masochism, and withdrawal, are discussed, and it is suggested that they contribute to the overall negative effect on academic achievement.—*R. Wiltz.*

2988. **Golick, Margaret.** (Montreal Children's Hosp., Quebec, Canada) *A parents' guide to learning problems.* *Journal of Learning Disabilities*, 1968(Jun), Vol. 1(6), 366-377.—The parents of children with learning disabilities must provide meaningful and exciting experiences and responsibilities, opportunities to learn and use "the common devices of our society," and the opportunity to learn games and to participate with other children.—*D. Hall.*

2989. **Hirt, Dorothy M.** (Hahemann Medical Coll. & Hosp., Philadelphia, Pa.) *Teaching children with severe learning disabilities.* *Reading Teacher*, 1970(Jan), Vol. 23(4), 304-310.—Suggests that a child's learning disabilities may be revealed in the areas of inadequate impulse control, poor perceptual and conceptual integration, and a defective self-concept. Examples of problems in each of these areas are presented

and discussed in relation to the conclusion that the "interpersonal relationship established between teacher and child is the most essential quality in educational therapy. The learning therapist must convey to the child a feeling of warmth and strength."—*R. Wiltz.*

2990. **Huizinga, Raleigh J. & Smalligan, Donald H.** *The area learning center: A regional program for school children with learning disabilities.* *Journal of Learning Disabilities*, 1968(Sep), Vol. 1(9), 502-506.—Discusses total educational-medical research done in regional learning centers, demonstrating that the idea of an area learning center which encompasses social, medical, and educational aspects of learning disabilities is viable and valid. Points critical to the effective functioning of 1 such center, conclusions drawn at the end of its 1st yr. of functioning, results of research to assess its effectiveness, and attitudes of constituents toward the center are summarized.—*M. Maney.*

2991. **Pavlovkin, Michal.** *K problému diferenciácie na osobitných školách.* [A contribution to the problem of differentiation in special schools.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(1), 51-60.—Suggests that the present monolithic system of educating and training mentally handicapped children is inadequate in view of the increasing number of children in need of special care. It is pointed out that there is a lack of uniformity of criteria in selection and placement procedures in special schools. Consequently, full use of intellectual capacity is not being made in all children. It is suggested that criteria be established for a definition of mental retardation. (Russian summary)—*English summary.*

2992. **Wright, Lance & McKenzie, Clancy.** (Hahemann Medical Coll. & Hosp., Philadelphia, Pa.) *"Talking" group therapy for learning-disabled children.* *Reading Teacher*, 1970(Jan), Vol. 23(4), 339-346, 385.—Hypothesizes that activities groups may overstimulate children with learning disabilities, and describes an alternative program in which talking groups were established with 5 hyperactive 11-yr-old boys. Descriptions of the children and their progress, and a narrative account of the group dynamics are presented. Various ways in which the children reacted to separation anxiety are discussed. It is concluded that such a group can be formed with hyperactive children, and that it has the advantage of being less likely to overstimulate the children, thus making it possible to place more emphasis on interpretation of group feelings and processes.—*R. Wiltz.*

Emotional Disorder

2993. **Allen, Thomas W.** (Washington U., Student Counseling Service) *The evaluation of a program of special classes for "disruptive children" in an urban school system.* *Community Mental Health Journal*, 1970(Aug), Vol. 6(4), 276-284.—Discusses the problems encountered by urban schools in "reclaiming" disruptive children. Although it is usually concluded that these children are "suffering from psychiatric illnesses" and are therefore beyond the scope of the school, recent evidence suggests that the "untoward behavior" of these children may be a response to the frustration and humiliation generated by their academic disabilities which are caused by physical problems or differences in the child's values and those of the school. "A multi-discipline-center organized within an urban school

system" to help such children is described. 53 elementary and secondary school Ss were placed in special class programs which presented opportunities, controls, and limits in a nonpunitive manner, and which were based on "continuous psychosocial-educational diagnosis of each child's strengths and shortcomings." Results indicate strong academic gains by experimental Ss. Controls, who had remained in regular classes, showed "a decelerating growth curve." It is concluded that many disruptive children can be educated without recourse to psychiatric treatment if placed in the right teaching surroundings. (21 ref.)—P. McMillan.

COUNSELING & GUIDANCE

2994. **Banducci, Raymond.** (Sacramento State Coll.) **Accuracy of occupational stereotypes of grade-twelve boys.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 534-539.—Examined the accuracy of occupational stereotypes of 679 high school senior boys in relation to socioeconomic status, academic development, crystallization of plans, vocational interests, and range of experience. Ss rated 12 occupations in terms of selected worker trait requirements needed for successful performance of a job. Responses were compared with *Dictionary of Occupational Titles* job qualification profile ratings of the jobs studied, and discrepancy (accuracy) scores were computed. Results indicate that Ss with high academic development had more accurate stereotypes of high rather than low level jobs, and Ss with low academic development and low socioeconomic status had more accurate stereotypes of low level jobs. Ss with crystallized plans and those of the realistic, intellectual, and enterprising Vocational Preference Inventory types also were found to have the most accurate stereotypes of occupations. (17 ref.)—*Journal abstract*.

2995. **Battin, R. & Kraft, Irvin A.** (Baylor U.) **Psycholinguistic evaluation of children referred for private consultation to a child psychiatrist.** *Journal of Learning Disabilities*, 1968(Oct), Vol. 1(10), 600-605.—From 446 children referred to a psychiatrist for behavior and school performance problems and tested for achievement and reading levels, 33 5-13 yr. olds were selected and studied by psycholinguistic techniques to determine whether such an evaluation should be a routine part of the child's work-up. Ss were tested with the WISC, the Illinois Test of Psycholinguistic Abilities (ITPA), the Frostig Test of Visual Perception, and the Goodenough-Harris Drawing Test. As many Ss were above the test age ceiling, language ages were used for comparisons for the ITPA. Support for previously held clinical impressions led to the conclusion that these tests and subtests are particularly sensitive to the problems of perceptually handicapped children. Definite test patterns were obtained on the ITPA, especially on the subtest for visual sequencing. Strong correlations appeared among certain subtests of the ITPA, Frostig, and WISC; and performance on the Goodenough-Harris proved interesting.—M. Maney.

2996. **Bauer, Roger E.** (Michigan State U.) **The effects of cognitive structuring on the outcomes of group counseling.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5227.

2997. **Dua, P. S.** (Clarendon Lab., Oxford, England) **Comparison of the effects of behaviorally oriented action and psychotherapy reeducation on introversion-extraversion, emotionality, and internal-ex-**

ternal control. *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 567-572.—Based on the assumption that 60 female undergraduates with expressed concern about their ability to interact and relate in interpersonal situations combine such anxiety with high degrees of introversion, emotionality, and externality as reflected in self-ratings and self-evaluative statements of beliefs, 2 experimental groups, 1 exposed to behaviorally oriented action programs and the other to psychotherapy reeducation programs, were contrasted with a no treatment control group. The relationship between treatment conditions and changes in attitudes and beliefs along the dimensions of the 3 personality variables of extraversion, emotionality, and externality was examined. After 8 wk., the action program procedures designed to create new behaviors for dealing with situations of interpersonal anxiety were more effective than reeducation programs in inducing attitudinal changes. Implications for counseling practice and behavioral theory are discussed. (17 ref.)—*Journal abstract*.

2998. **Geist, Harold.** **A comparison of vocational interests at different levels in schools in Japan and a comparison with United States counterparts.** *Psychologia: An International Journal of Psychology in the Orient*, 1969(Dec), Vol. 12(3-4), 227-231.—Inspection of most and least popular interest areas at high school and college levels in both countries indicates very little difference at the respective educational levels. For high school males, computational and scientific interests were high. For high school females, persuasive and clerical interests were high. For college level males, computational and literary interests were high. College females differed somewhat in the 2 countries.—R. D. Nance.

2999. **Haettenschwiler, Dunstan L.** (State U. New York, Buffalo) **Control of the counselor's role.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 437-442.—Assesses from an organizational point of view, the forces at work in determining the counselor's role, showing why those occupying counterpositions to that of the counselor may wish to prescribe his role and how this is accomplished through control of positive and negative sanctions. Also, certain organizational problems arise for the counselor by virtue of occupancy of a boundary position. A proposal is made regarding direction and strategy for bringing about a desired change. (22 ref.)—*Journal abstract*.

3001. **Ho, Man K.** (Florida State U.) **The effect of group counseling on the academic performance, study habits and attitudes, and the interpersonal adjustment of foreign students.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5237-5238.

3002. **Jacobs, James R.** (U. Wisconsin) **Characteristics of students who seek counseling.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5238.

3003. **Johansson, Charles B.** (Macalester Coll., Office of Education Research) **Strong Vocational Interest Blank Introversion-extraversion and occupational membership.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 451-455.—Contrasted item responses for the SVIB for a group of introverted and extraverted undergraduates. A scale was constructed for the SVIB to measure a dimension of occupational introversion-extraversion (OIE). The test-retest reliability

of the OIE was of the same magnitude as the other SVIB scales; item content of the scale indicated that extraverts liked those items dealing with people and social situations and introverts liked those items that indicated a sense of being alone. Construct validity of the OIE scale involved scoring 129 male occupational samples on the scale; the ranking of the occupations indicated a dimension of interpersonal contact where the introverted end of the scale was represented by physicists, farmers, and astronomers, and the extraverted end by occupations, i.e., sales groups, governors, and chamber of commerce executives.—*Journal abstract.*

3004. Madanes Sojit, Cloë. **Modelo para la organización y evaluación de un servicio de prevención primaria para niños en edad escolar.** [A model for the organization and evaluation of a service of primary prevention for elementary school children.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Dec), Vol. 15(4), 356-359.—Based on Gerald Caplan's concept that teachers are important intermediaries between mental health specialists and children, the teachers of 6 schools were interviewed at the beginning and at the end of a school year. Caplan's technique of consultation on mental health was used in 2 schools, a contrasting technique, education, was used in 2 other schools, and the other 2 schools were controls. A comparison between 1st and last interviews by the consultation technique revealed a greater understanding of student behavioral problems by teachers than was evidenced where the other techniques were used. Consultation appeared to be an effective preventative measure against mental disorders. Further analysis is being conducted to evaluate the long-range effectiveness of the consulting service. (English summary)—*P. Hertzberg.*

3005. Maynard, Peter E. & Hansen, James C. (Teachers Coll., Columbia U.) **Vocational maturity among inner-city youths.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 400-404.—Investigates the efficacy of the Vocational Development Inventory (VDI) in measuring the vocational maturity of inner-city boys. The VDI was administered to 180 white and 180 black inner-city boys and 90 white suburban boys. Intelligence test results were obtained and converted to standardized T scores. The mean vocational maturity scores indicate large differences among the samples. However, when intelligence was controlled by analysis of covariance, the differences were erased. It is concluded that researchers and counselors account for a variety of intellectual and social variables when working with the vocational maturity of inner-city youth. (20 ref.)—*Journal abstract.*

3006. Pallone, Nathaniel J., Richard, Fred S., & Hurley, Robert B. (New York U., School of Education) **Key influences of occupational preference among black youth.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 498-501.—Assessed the relative frequency with which each of 9 specific key figures was self-reported by 161 black and 218 white adolescents from working class families as having exercised a principal influence over them in their selections of occupations they aspired to enter. In order of descending frequency, black males cited as key figures persons holding the preferred occupation, parent, teacher, peer or sister or brother, relative not of the immediate family or counselor, and neighbor; black females cited, in order, mother, persons in the preferred occupation, peer, brother or sister, relative not of the immediate family or teacher, father, counselor, and neighbor. Rank-order

coefficients reveal the greatest similarity in key figure influence between black and white males ($r' = .82$), the least similarity between male and female whites ($r' = .48$), and greater similarity between male and female blacks ($r' = .68$) than between black and white females ($r' = .59$).—*Journal abstract.*

3007. Prediger, Dale J. & Baumann, Reemt R. (American College Testing Program, Iowa City, Ia.) *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 527-533.—Provided developmental group counseling to 30 groups of randomly selected vocational high school students for a minimum of 1 academic yr. The groups included 6-8 members and met for 1 40-min period/wk. 2 types of control groups, inactive and placebo, were available. Outcome was evaluated on each of 30 measures, many of which could be described as socially valued, external, and objective. No experimental-control group differences of practical significance were observed on these measures despite substantial differences between counseling group and placebo control group students in perception of personal benefit. (16 ref.)—*Journal abstract.*

3008. Resnick, Harvey; Fauble, Marianne L., & Osipow, Samuel H. (Ohio State U.) **Vocational crystallization and self-esteem in college students.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 465-467.—A positive relationship between vocational crystallization and self-esteem in 216 undergraduates was assessed by observing differences on 2 measures of vocational crystallization in students high and low in self-esteem scores on the Tennessee Self-Concept Scale. No differences according to self-esteem were observed on 1 criterion measure, the number of Kuder Preference Record scores greater than the 75th percentile. However, differences were observed in the certainty of high- and low-self-esteem Ss. The relationship between self-esteem and vocational crystallization was the same for both sexes.—*Journal abstract.*

3009. Southworth, J. Alfred & Morningstar, Mona E. (U. Massachusetts, Counseling Center) **Persistence of occupational choice and personality congruence.** *Journal of Counseling Psychology*, 1970(Sep), Vol. 17(5, Pt. 1), 409-412.—To examine the predictive value of the Holland Vocational Preference Inventory (VPI) in determining perseverance in engineering, the VPI was administered to 102 freshmen engineering students. Ss were later divided into 3 groups as determined by their status at the beginning of their junior yr.: (a) Ss who were still majoring in engineering ($N = 43$), (b) Ss who had left engineering but were still attending the university ($N = 33$), and (c) Ss who had left the university ($N = 26$). A multivariate analysis performed on the VPI scale scores for each S was significant ($D^2 = 28.26$, $p < .01$) showing that the scales were sufficient to differentiate among the 3 groups. Maximum differentiation occurred on the Social and Artistic scales.—*Journal abstract.*

3013. Picerno, Vincent J. (State University Coll. New York, Cortland) **The role of the elementary classroom teacher and the music specialist: Opinions of the music supervisor.** *Journal of Research in Music Education*, 1970(Sum), Vol. 18(2), 99-111.—Questionnaires were sent to music supervisors in 1/2 (355) of the local school systems in New York State having elementary schools and 274 (74%) responded. Results indicate: (a) less time (50.91 hr/wk) is devoted to the teaching of music than is desirable; (b) music specialists do 87% of the teaching; (c) 39% of the classroom teachers have some responsibility for teaching music in the classrooms (in singing and follow-up work), although 71% of the music supervisors favored having the classroom teachers teach part of the music; and (d) 90% of the supervisors indicated that elementary classroom teachers had limited preparation, and 93% felt that they were not interested in teaching music.—*D. Higbee*.

Teachers & Teacher Training

3014. Abramson, Theodore. (Fordham U.) **Development and application of analysis of variance techniques to the reliability of observation schedules.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5274-5275.

3015. Anderson, James. (Michigan State U.) **The relationship of teacher belief systems to teacher and pupil factors related to school goals cathexis.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5275-5276.

3016. Apt, Madeline H. & Fahey, George L. (Wright State U., Dayton, O.) **A measurement of college instructor behavior.** *Scientia Paedagogica Experimentalis*, 1968, Vol. 5(1), 32-41.—Examines the usefulness of a graphic rating scale based on the Osgood semantic differential scale and the Classroom Observation Record in measuring college instructor behavior and in yielding clusters of traits which would identify subgroups of college instructors. In the pilot study, 116 undergraduates rated 3 instructors; in the 1st phase of the experiment 4916 Ss rated 112 liberal arts instructors and in the 2nd phase 2967 Ss rated 59 instructors from the sample in the 1st phase. Results show that "the instrument cannot be used appropriately as a measure of behavior," and that "student ideas of effective instruction were unrelated to subject matter and the traditional divisions of academia but were based upon the instructor's ability to convey the subject." (French summary)—*G. Steele*.

3017. Brophy, Jere E. & Good, Thomas L. (U. Texas) **Teachers' communication of differential expectations for children's classroom performance: Some**

behavioral data. *Journal of Educational Psychology*, 1970, Vol. 61(5), 365-374.—Investigated the processes by which teachers communicate differential performance expectations to different children through observational study of dyadic contacts between teachers and individual students in 4 1st grade classrooms. Differential teacher expectations for different children were associated with a variety of interaction measures, although many of these relationships are attributable to objective differences. However, other differential teacher behavior was observed which is not attributable to objective differences among the children and which is consistent with the hypothesis that differential teacher expectations function as self-fulfilling prophecies. Teachers demanded better performance from those children for whom they had higher expectations and were more likely to praise such performance when it was elicited. In contrast, they were more likely to accept poor performance from students for whom they held low expectations and were less likely to praise good performance from these students when it occurred, even though it occurred less frequently. Findings support the hypotheses of R. Rosenthal and L. Jacobson concerning teacher-expectation effects and as indicative of the behavioral mechanisms involved when teacher expectations function as self-fulfilling prophecies.—*Journal abstract*.

3018. Charlton, Larry H. (Utah State U.) **Teacher personality and acceptance of team teaching.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5280.

3019. Frank, Ruth E. (Bucks County Community Coll., Newtown, Pa.) **Can changes in professional attitudes be catalyzed by coursework in social foundations of education?** *Scientia Paedagogica Experimentalis*, 1968, Vol. 5(1), 68-75.—Administered the Minnesota Teacher Attitude Inventory to 23 undergraduates without teaching experience and 9 practicing teachers before and after they had attended a course in social foundations of education. The average score change of the teaching group was 2 points while the average score was higher by about 1 point during the 2nd test. However, for the nonteacher group the average score change was 13 points and the 2nd test score average was 12 points higher. Thus the nonteaching group not only changed a great deal more, but they changed far more uniformly in the desirable direction. It is suggested that these findings be applied in the scheduling of social foundations courses early in the professional preparation of the student. (German summary)—*Journal summary*.

3020. Horner, Lucie T. (Northern Illinois U.) **Broadener participation in foreign language teacher training.** *Modern Language Journal*, 1970(Apr), Vol. 54(4), 250-252.—Describes 3 areas of concentration which could improve the preparation of prospective foreign language instructors. An advanced grammar course would provide an intensive grammar review which would enhance the teacher's ability to explain and demonstrate grammatical phenomena. Advanced conversation would enable the future teacher to gain practice and confidence in conveying the gist of a dialogue or in summarizing a narrative. An introduction to literature course would prepare the student teacher for conveying the aura and philosophical background of foreign language literature. It is argued that adequate background is not supplied by a "methods" course, and a revision of curriculum for the future teacher is suggested.—*C. O'Donnell*.

3023. Minter, Joseph R. (East Texas State U.) **The effects of sensitivity training on self concept and attitudes of student teachers.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5323-5324.

3024. Moore, Raymond. (Drake U.) **Structure of faculty attitudes toward the university teachers' role: A factor analytic study.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 20(2), 293-299.—University faculty members were asked to state their preferences for statements pertaining to learning, teaching, etc., on a 10-point certainty scale. The responses of 111 faculty members who returned the 46-item questionnaire were factor analyzed. 2 bipolar factors emerged: conservative-liberal and attention to student needs as a person. Factor 3, explaining a small proportion of the variance, refers to an ivory tower orientation.—N. M. Chansky.

3025. Moses, H. A. & Delaney, D. J. (U. Illinois) **Dimensions of pressures faced by teachers: A factor analytic study.** *SPATE Journal*, 1970, Vol. 8(4), 122-128.—A scale was constructed that yielded 69 Likert-type items from a pool of some 700 statements that graduate education students felt expressed the greatest pressures of teachers. The Pressures of Teachers Scale (POT) was administered to another group of 63 graduate students of education who rated each item on a 4-point scale. Analysis of the POT Scale yielded 18 rotated factors that accounted for 100% of the common factor variance. Each factor had at least 1 variable with a loading greater than .60. A complete summary of factor patterns for each factor is presented.—S. M. Amatora.

3026. Pate, R. T. & Dumas, W. (Wichita State U.) **Self-concept change in elementary student teachers.** *SPATE Journal*, 1970, Vol. 8(4), 115-121.—To determine the nature and extent of student teachers' changes in self-concept in each of 20 subcategories of the Student Teaching Experience, the Fiedler Perception Scale adapted by McCallon was administered to 64 prospective elementary school teachers at the beginning and at the end of their student teaching. No statistically significant negative changes occurred for any category. Positive change was most pronounced for those who worked with slow or otherwise disadvantaged children, but statistically significant positive changes were apparent for several experience categories.—S. M. Amatora.

3027. Woike, Kay. **Responding to children's feelings.** *Religious Education*, 1970(May), Vol. 65(3), 265-271.—Case study of a group of 8 3rd grade girls from a racially mixed, middle-class New England neighborhood revealed the importance of recognizing and dealing with both positive and negative emotions in nondestructive ways. The manner in which a teacher handles conflicts and occasions in which he must limit behavior or provide group direction can be crucial to the group and to individuals in it. Media that can promote feelings of personal worth include: warm relationships between leader and members; relationships between group members; verbal communication; and nonverbal com-

munication through such media as games, crafts, and play activities.—S. E. Gavin.

SCHOOL LEARNING & ACHIEVEMENT

3028. Allen, D. Ian. (Simon Fraser U., Burnaby, British Columbia, Canada) **Some effects of advance organizers and level of question on the learning and retention of written social studies material.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 333-339.—Used 1-way analysis of variance with post hoc comparisons to study the effects on learning and retention of advance organizers and memory level or higher order questions for 212 9th graders in 12 classes in 2 junior high schools. Tests measuring retention of question-specific learning and generalized higher order learning of narrative and descriptive material were administered the day following the completion of 4 learning sessions and equivalent forms were administered 3 wk. later. Ss at or above the 60th IQ percentile were compared, as were those between the 20th and 59th percentiles. On the 1st test there were differences between the groups at both ability levels which were attributable to the effects of specific questions but there appeared to be no differences due to advance organizers. On the 2nd test question-specific facilitation was apparent for lower ability Ss who had received advance organizers. On this test, advance organizers resulted in general facilitation for higher ability Ss only. (17 ref.)—*Journal abstract.*

3029. Ames, Louise B. (Gesell Inst. of Child Development, New Haven, Conn.) **Academic promise in Negro primary school pupils.** *Journal of Learning Disabilities*, 1968(Oct), Vol. 1(10), 570-577.—Compared responses of 388 kindergarten-5th grade children with those of white children of similar age and socioeconomic level to determine whether behavior patterns for Negro Ss develop in the same manner and rate as do those of children from other groups, and to identify those Negro Ss who show academic promise (ability to finish high school with creditable performance and perhaps to continue beyond). Results based on the Rorschach, the Lowenfeld Mosaic, the Gesell School Readiness Test, and the Slossen Intelligence Test for Children show that: (a) 18-39% of Ss/grade and 33% of all Ss show special promise; (b) for most aspects of behavior studied, the response of Negro Ss falls short of that of white Ss; (c) performance of the 2 groups comes closest on simple maturity level tests and writing name and numbers; (d) behavior changes with age are similar in the 2 groups, however, white Ss tend to reach any given state of development somewhat sooner; (e) for most tests, Negro Ss develop in the same way but at a lower level and slower rate than do white Ss, except for the Rorschach where Ss are most alike at 5 yr. of age after which Negro Ss do not improve with age; and (f) performance of Negro Ss falls on a rectilinear rather than along a normal curve, with an abnormally wide distribution and a marked bunching at the lower end of any scoring scale.—*Journal summary.*

3030. Baird, Leonard L. (American Coll. Testing Program, Iowa City, Ia.) **Patterns of educational aspiration.** *ACT Research Report*, 1969(Dec), No. 32, 22 p.—Studied undergraduates whose degree aspirations were discrepant with their ability or incomes. The 1st study was concerned with Ss whose degree goals appeared to be either unrealistically high or markedly

lower than others with their measured academic aptitude. The 2nd study was concerned with Ss whose family incomes seemed inappropriate to their degree goals. These subgroups were compared with Ss whose goals were more appropriate using a broad range of demographic and educational information. Ss in the subgroups proved quite similar to typical students except in degree of nonacademic achievement. (24 ref.)—*Journal abstract*.

3031. Bottenberg, E. H. & Wehner, E. G. (U. Würzburg, Psychologisches Inst. 1, W. Germany) **Schulleistungen in Abhängigkeit von Intelligenz und kognitiven Einzelfunktionen.** [School performance in relation to intelligence and specific cognitive functions.] *Schule und Psychologie*, 1970, Vol. 17(1), 19-23.—Demonstrated through a factor analytic study that performance in a wide spectrum of 13th grade Ss is systematically influenced by intelligence as well as specific cognitive functions.—*Author abstract*.

3032. Cohen, David K. (Harvard U.) **Immigrants and the schools.** *Review of Educational Research*, 1970(Feb), Vol. 40(1), 13-27.—Considers the effect of immigrant influx and culture as this has effected the public schools. The conclusions are based upon children of 1st-generation immigrants, and a comparison is made between the achievement of these children and native-born whites. The problems of IQ, retardation, and social mobility of some immigrant classes are reviewed in terms of research to date. (29 ref.)—P. D. Leedy.

3033. Crewe, James C. (U. Minnesota) **The effect of study strategies on the retention of college text material.** *Journal of Reading Behavior*, 1969(Spr), Vol. 1(2), 45-52.—113 undergraduates were randomly assigned to either a control group which took a multiple-choice test without studying, a cramming group which studied the material for 2 hr. the day before testing, or 1 of the following treatment groups which took the test 5 wk. after the 1st review: (a) no-review, in which Ss studied the material for 2 consecutive hours; (b) 1-review, in which Ss studied for 1 hr. 45 min. and reviewed for 15 min. the day before testing; or (c) 2-review, in which Ss studied for 1 hr. 30 min., reviewed for 15 min. 2 wk. later, and reviewed for 15 min. the day before testing. All Ss studied a 13-page chapter from a college level history book by the underlining method. Results based on the 87 Ss who completed the project indicate the following: (a) the control group performed no better than chance on the test, (b) the cramming group scored significantly higher than any other group, and (c) both review groups scored significantly higher than the no-review group. It is concluded that retention score is higher when more study time is close to test time, and that even relatively short reviews facilitate retention.—R. Wiltz.

3034. Galocy, Joseph C. (U. Georgia) **The effects of pretraining in transfer and letter naming on the rate children learn.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5339-5340.

3035. Gulice, Billy M. (Florida State U.) **The use of the cloze procedure for improving reading comprehension of college students.** *Journal of Reading Behavior*, 1969(Sum), Vol. 1(3), 81-92.—76 college Ss enrolled in a reading improvement course were randomly assigned to morning or afternoon sections, and those in each section were randomly assigned to either an experimental group which received instruction and practice in the cloze procedure in addition to regular

instruction in reading comprehension, or a control group receiving only the latter training. Results indicate no significant difference between groups in improvement in reading comprehension as measured by difference in pre-posttest scores on alternate forms of the Cooperative English Test Reading Comprehension. Further analysis revealed significant gains in posttest scores by both groups, and a significant difference in improvement of afternoon over morning groups. Significant correlations were also found between cloze or comprehension and various measures of intelligence and creativity. The insignificant finding was suggested to be a result of any of the following: small number of Ss, high level of control group improvement, and/or high level of concentration required by the cloze exercises. (16 ref.)—R. Wiltz.

3036. Hanson, Gary R. & Taylor, Ronald G. (American Coll. Testing Program, Iowa City, Ia.) **Interaction of ability and personality: Another look at the drop-out problem in an institute of technology.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 540-545.—Examined the interaction of ability and personality in discriminating between 4 groups of 408 engineering students differing in academic success and persistence. Multiple discriminant analysis was used to determine the number and nature of the dimensions related to academic success and persistence in an institute of technology. 2 dimensions discriminated between the 4 groups. 1 dimension was described in terms of previous high school achievement and separated academically successful from unsuccessful students. The 2nd dimension, described in terms of personality characteristics, discriminated between students who withdrew and those who persisted.—*Journal abstract*.

3037. Hountras, Peter T., Grady, William E., & Vraa, Calvin W. (U. North Dakota) **Manifest anxiety and academic achievement of American and Canadian college freshmen.** *Journal of Psychology*, 1970(Sep), Vol. 76(1), 3-8.—Investigated whether significant differences existed between American and Canadian college freshmen with different levels of manifest anxiety in academic achievement. 23 American and 25 Canadian male undergraduates were administered a forced choice form of the MA Scale. Scores on the American College Test administered prior to admission were also available. It is concluded that manifest anxiety was not related to the observed differences in the 1st-yr achievement of American and Canadian students when academic aptitude was held constant.—*Journal summary*.

3038. Johnson, Terry D. (U. British Columbia, Vancouver, Canada) **The relationship between connotative meaning and reading achievement of boys and girls in the second grade.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5287.

3039. Leifer, Anna. (Yeshiva U.) **Relation of mosaic patterns to spelling and reading in low achievers.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 463-467.—The Lowenfeld Mosaic Test (LMT) and the Wide Range Achievement Test were administered to 68 7-10 yr. old slow learning children. At ages 7 and 8, LMT correlated .7 with spelling and .5 with reading.—N. M. Chansky.

3040. Masek, Richard M. (Utah State U.) **The effects of teacher applied social reinforcement on arithmetic performance and task-orientation.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5345-5346.

3041. Moon, Peter E. (Purdue U.) **The use of life history data in the classification of college freshmen by major areas.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5694-5695.

3042. Rim, Y. & Kurzweil, Z. E. (Israel Inst. of Technology, Haifa) **Reward and punishment in education.** *Scientia Paedagogica Experimentalis*, 1968, Vol. 5(1), 101-107.—Presents an historical review and examines 35 psychological studies "on the effects of praise and blame on the performance of school children." It is concluded that: (a) "praise and blame are relevant to education" when "they help to improve pupils' performance," (b) personality structure must be considered in determining whether to use praise or blame as incentives, (c) punishment has harmful effects, and (d) H. Pestalozzi's observations are in accord with modern findings. (German summary)—G. Steele.

3043. Ryals, Kelvin R. (Washington U.) **An experimental study of achievement motivation training as a function of the moral maturity of trainees.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5302.

3044. Savicki, Victor; Schumer, Harry, & Stanfield, Robert E. (U. Massachusetts) **Student role orientations and college dropouts.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 559-566.—Compared 3 withdrawal groups (dismissals, defaulters, and dropouts) and 2 persister groups (successful persisters and probation persisters) on a factor-analyzed scale of student's role orientations toward college (vocational, academic, intellectual, social development, consummatory collegiate, instrumental collegiate, ritualistic, and greek). The Role Orientations Scale (Student Preference Schedule) was administered just prior to entering the university and the criterion groups were formed after 1 full academic yr. A multiple discriminate analysis yielded a significant function which indicated that defaulters and successful persisters as distinguished from probation persisters and dismissals have stronger preferences for social development and vocational behaviors, moderate interest in academic, intellectual, and ritualistic activities, and a moderate dislike for collegiate behavior. (22 ref.)—*Journal abstract.*

3045. Shearson, Gilbert F. (U. Georgia) **Color deficiency and reading achievement in primary school boys.** *Reading Teacher*, 1969(Mar), Vol. 22(6), 510-512, 577.—Compared 35 white 1st, 2nd, and 3rd grade color deficient boys as a group and as subgroups based on degree of deficiency (10 mild, 14 medium, and 11 strong) with 35 white noncolor deficient boys matched for grade in school. Results based on Metropolitan Achievement Test scores indicate no significant differences between the 2 main groups; however, the noncolor deficient subgroup scored significantly higher than the mild color deficient subgroup. It is concluded that "there is no relationship between color deficiency and success in reading as measured by the Metropolitan Achievement Test." However, since 7 of the 9 color deficient Ss who could not be classified as to type of deficiency were in the mild group, it is suggested that color perception follows a developmental pattern, i.e., slow development of color perception might parallel slow development of other physical capabilities that could affect reading skills.—R. Wiltz.

3046. Shinedling, Martin M. & Pedersen, Darhl M. (Brigham Young U.) **Effects of sex of teacher and student on children's gain in quantitative and verbal**

performance. *Journal of Psychology*, 1970(Sep), Vol. 76(1), 79-84.—4th grade classes of 4 male and 4 female teachers were tested at the beginning and end of the school yr. using the California Achievement Test (CAT). The classes were subdivided into males and females and the CAT was subdivided into quantitative and verbal areas. Male students did best under male teachers in quantitative areas, and male students did worse under female teachers in verbal areas. It is postulated that the results were produced by natural cultural expectancies.—*Journal summary.*

3047. Shrager, Morris I. (U. Kansas) **The effect of approving teacher comments on pupil achievement and attitude.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5302-5303.

3048. St. John, Nancy H. (Harvard U.) **Desegregation and minority group performance.** *Review of Educational Research*, 1970(Feb), Vol. 40(1), 111-133.—The topic was considered under several headings: choice of research design, longitudinal 1-group studies, cross-sectional studies, Coleman and commission reports, 4-celled studies, and the author's conclusion that the literature reviewed offered some evidence as to the relation between the racial composition of the school and academic achievement, but much more evident was the difficulty of research in the area. Societal experimentation with desegregation must precede research evaluation of it. (5 p. ref.)—P. D. Leedy.

3049. Svedman, Shirley. (Lincoln Junior High School, Ft. Collins, Colo.) **Semantic sensitivity and reading achievement.** *Reading Teacher*, 1970(Apr), Vol. 23(7), 640-646, 648.—Developed and administered the Semantic Sensitivity Test (SST) to 102 11 and 12 yr. olds. The test consisted of objective questions involving homonyms, multiple meanings of words, colloquialisms, and slang expressions designed to measure S's awareness that words have more than 1 meaning, and that meaning varies with content. Ss' scores on the Reading subtest of the California Achievement Test and the Gates MacGinitie Survey were also obtained. Results show a correlation of .72 between the SST and each of the standardized tests, which correlated .78 with each other. A significant t value of the correlation coefficient of the SST "suggests that the better the semantic sensitivity, the higher the reading achievement tends to be." It is suggested that this test, which is easy to administer and grade, is a "beneficial tool for the teacher to use at the beginning of the year or at other times when a quick approximation of a student's reading achievement or language understanding is needed."—R. Wiltz.

3050. Swafford, Jane O. (U. Georgia) **A study of the relationship between personality and achievement in mathematics.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5353.

3051. Taylor, Ronald G. & Hanson, Gary R. (U. Minnesota, Student Counseling Bureau) **Interest and persistence.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 506-509.—Investigated whether persistors and nonpersistors differed in inventoried occupational interests. 485 engineering students after their freshmen yr. were divided into successful persistors, successful transfers, unsuccessful dropouts, and unsuccessful persistors groups. The SVIB for men was used to compare the Ss in the 2 persister and 2 nonpersister groups. Analysis of variance was the basic statistical treatment followed by selected post hoc comparisons of significant scales. Results indicate that: (a) successful

persistors have engineering-related interest and reject social service interest; (b) successful transfers have verbally expressive and leadership interest and reject technical interest; (c) unsuccessful engineering students reflect unclear and undifferentiated interest; and (d) unsuccessful persistors have technical, physically active interest and less engineering-related interest.—*Journal abstract.*

Prediction

3052. Akeju, Simeon S. & Michael, William B. **Predicting success in the Federal School of Science, Lagos, Nigeria.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 483-486.—The West African School Certificate Examination (WASCE) is a 6-essay achievement test yielding English language, mathematics, and science scores. This is administered as a screening device. These areas are incorporated within the General Certificate of Education Examination, a test given at the program completion. Students also receive achievement tests which parallel areas tapped by the WASCE. Correlations between the predictor and criteria varied from .02 to .5. Multiple correlations ranged from .43 to .70. Most predictable was achievement in physics. —N. M. Chansky.

3053. Caldwell, James R., Schrader, Donald R., Michael, William B., & Meyers, C. E. **Structure-of-Intellect measures and other tests as predictors of success in tenth-grade modern geometry.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 437-441.—Students in 2 participating high schools had been administered 11 Structure-of-Intellect (SI) tests. The criterion was the Geometry test of the Cooperative Mathematics Tests which was administered 2 wk. before the end of the term. The most valid SI test correlated .60 with Geometry scores. When the 9th grade algebra grade was included, R increased to .65 in 1 school and to .70 in the other.—N. M. Chansky.

3054. Cauwelier, I. (U. Louvain, Belgium) **Motivatie als predictor van studiesucces.** [Motivation as a predictor of study success.] *PMS: Tijdschrift voor Psycho-Medisch-Sociaal Werk*, 1970, Vol. 16(1), 22-26.—Plates 1, 2, 3BM, 6BM, 7BM, 8BM, 10, 11, 14, and 20 of the TAT were used with 300 high school seniors. The protocols were analyzed according to Arnold's method. $\frac{1}{3}$ of the Ss received instructions which emphasized fantasy, $\frac{1}{3}$ neutral instructions, and $\frac{1}{3}$ received instructions which stressed achievement. The correlation with Amthauer-Mon's Intelligence Structure Test (IST) was .17. The correlation between school results and the IST was .25 and the correlation between the TAT motivation index and school success was .57 (for the fantasy condition, .61; for the neutral condition, .45; and for the achievement condition, .65). In a multiple regression equation to predict school results, the weight for the motivation index was .543 and for the IST, .157.—S. G. Vandenberg.

3055. Dunsing, Jack D. (Purdue U.) **Perceptual-motor factors in the development of school readiness: An analysis of the Purdue Perceptual-Motor Survey.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Oct), Vol. 46(10), 760-765.—Examined 50 1st-4th grade children with the Purdue Perceptual-Motor Survey (PPMS). A series of statistical analyses is presented using data from the standardization. A factor analysis was performed and 6

rotated factors emerged which were traced developmentally through the grades. In general, data support the rationale developed by N. C. Kephart (see PA, Vol. 35:2747) as the basis for the PPMS, but with modifications. The interaction of the stress of the school situation with development of ocular control and organization of movements in space is especially crucial. The predictive usefulness of the factors is variable, but the organization of movements in space and dynamic balance factors were the best predictors of reading and arithmetic grades. Rhythmic writing and postural stability were also predictors of the arithmetic grade. —*Journal abstract.*

3056. Egeland, Byron; Di Nello, Mario, & Carr, Donald. (Syracuse U.) **The relationship of intelligence, visual-motor, psycholinguistic and reading-readiness skills with achievement.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 451-458.—The WISC, the Illinois Test of Psycholinguistic Abilities, the Harrison-Stroud Reading Readiness Test, and the Bender Gestalt were administered to 125 1st graders. The Grades 1 and 3 Metropolitan Achievement Test (MAT) scores of the 82 Ss remaining in Grade 3 were correlated with the predictors. Correlations of the mental tests with achievement were approximately .2 in Grade 1 and .3 in Grade 3. Harrison-Stroud scores correlated with MAT higher in Grade 1 than in Grade 3. Multiple R in Grade 1 of .69 was produced by 2 Harrison-Stroud subtests and the Bender Gestalt. In Grade 3 2 Harrison-Stroud subtests and the WISC Full Scale IQ produced a similar R.—N. M. Chansky.

3057. Egeland, Byron; Hunt, David E., & Hardt, Robert H. (Syracuse U.) **College enrollment of Upward Bound students as a function of attitude and motivation.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 375-379.—Studied the relation of Upward Bound students' scores on a variety of attitude, motivational, and demographic measures to the likelihood of their enrolling in college by forming a college (N = 304) and noncollege (N = 108) group, individually matched on GPA, high school curriculum, and Upward Bound program attended. The Upward Bound Ss who later went on to college were superior to a noncollege group on the following measures: interpersonal flexibility, self-evaluated intelligence, possibility of college graduation, and importance of college graduation. Comparisons on demographic measures indicate a relationship between peer groups and students post high school interests. A large proportion of the college group came from larger high schools, did not fall in the lowest income level, and had mothers who remained at home.—*Journal abstract.*

3058. Elton, Charles F. & Shevel, Linda R. (American Coll. Testing Program, Iowa City, Ia.) **Who is talented? An analysis of achievement.** *ACT Research Report*, 1969(Sep), No. 31, 13 p.—Compared undergraduates who scored very high, very low, and average on the American College Testing Program on their responses to 48 items of 6 nonacademic achievement scales. Significant relationships were found between academic ability and several specific nonacademic achievements. Some items within single scales were positively related to academic ability; others in the same scale were negatively related or not related. Some significant relationships for 1 sex were not significant for the other. Results imply that the relationship between academic talent and any nonacademic talent depends on the

specific achievements chosen to define the talent. —*Journal abstract.*

3059. **Faterson, Hanna F., Moldowski, Edward W., & Moldowski, Leslie H.** (State U. New York, Downstate Medical Center, Brooklyn) **The human figure drawing test and academic outcome in medical school.** *Journal of Medical Education*, 1969(Oct), Vol. 44(10), 929-933.—Obtained human figure drawings from 125 male students at the time of their application to medical school, but did not use them in the admissions process. The drawings could be reliably dichotomized as being suggestive of either potential academic success or failure on the basis of specific graphic criteria. Success or failure, defined as graduation or nongraduation with the class 4 yr. later, was found to be related well above chance ($p < .001$) to ratings of drawings. The potential use of the human figure drawings as an adjunct to the selection process is discussed.—*Journal summary.*

3060. **Hackman, J. Richard; Wiggins, Nancy, & Bass, Alan R.** (Yale U.) **Prediction of long-term success in doctoral work in psychology.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 365-374.—Examined 4 sets of predictors in a study of the classroom performance, PhD progress and status 6 yr. after enrollment in the program of 42 doctoral candidates. Undergraduate GPA in psychology was correlated .3 with end of year GPA but not with long-term criteria. Graduate Record Examination scores were correlated with short- and long-term criteria. Hours of undergraduate language courses were negatively correlated with long-term criteria. Rated quality of undergraduate college was correlated .3 with perceived progress toward PhD as well as adjudged success 6 yr. after enrollment.—*N. M. Chansky.*

3061. **Jacobs, Paul D., Munz, David C., Barrett, Lois, & Everett, Frances.** (U. Oklahoma) **Academic survival: Success indicators in introductory psychology.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 231-233.—To identify and assess the importance of attitudinal factors as determinants of academic success, 12 motivational concepts were rated on a 9-scale semantic differential by 121 undergraduates in 2 studies. The 1st study identified 3 possible predictive concepts: test, studying, and marriage. The 2nd study cross-validated and assessed the stability of these concepts during the course duration. Only the concept test was found to be a stable and persistent predictor of academic success.—*Journal abstract.*

3062. **Jefferson, George L.** (U. Georgia) **Lexical and structural items as predictors of readability for high and low ability readers.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5287.

3063. **Loeb, Jan W. & Mueller, Daniel J.** (U. Illinois) **The use of a scale of high schools in predicting college grades.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 381-386.—Index of academic quality in a high school was determined by the average discrepancy and actual and predicted GPA of the college students who had attended that high school. When this index was combined linearly with the American College Test Composite score and high school percentile rank, correlation with college GPA rose from .39 to .47.—*N. M. Chansky.*

3064. **Lunneborg, Patricia W.** (U. Washington) **EPPS patterns and academic achievement in counseling clients.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 393-398.—Frequently recurring

2-variable EPPS patterns were noted in 1 sample of counseling clients. In a 2nd sample these patterns were correlated with EPPS scores, Washington Pre-College Test Battery scores, and college GPA. The findings indicate that in that sample high school grades correlated highest with college GPA. Neither EPPS patterns nor subtest scores correlated with grades.—*N. M. Chansky.*

3065. **Lunneborg, Patricia W., Lunneborg, Clifford E., & Greenmun, Renny.** (U. Washington) **An attempt at predicting long term nonintellective indices of community college study.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 399-403.—Intellective data were found in school records of performance on the Washington Pre-College Test Battery, high school and college grades. A mailed survey (24% return) to community college graduates produced 15 nonintellective measures. Intellective predictors correlated with grades but not with satisfaction with studies or usefulness of curriculum.—*N. M. Chansky.*

3066. **McCullah, Robert D.** (U. Maryland) **Prediction of academic performance in the U.S. Navy Hospital Corps School vocational training programs.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5677.

3067. **Moore, Gary T.** (Clark U.) **Creativity and the prediction of success in architecture.** *Journal of Architectural Education*, 1970(Apr), Vol. 24(2), 28-32.—Discusses the prediction of academic success in the selection of students in the design and planning disciplines. An 8-part battery of tests of creativity was developed and administered to 94 undergraduate and graduate architecture students. Results indicate that 3 of the tests are highly related to success in architecture and are a better predictor of success than either high school record and precollege examinations or the Architectural School Aptitude Test. From mathematical analysis of the tests (the Creative Problem Solving battery), it is suggested that the combination of creative problem solving tests and traditional tests may be an excellent overall predictor of an applicant's potential for success in architecture.—*Author abstract.*

3068. **Reed, Robert L.** (U. Kansas) **An application of the joint multiple regression model to the prediction of academic success from personality variables.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5300.

3069. **Scott, Ralph.** (U. Northern Iowa) **Perceptual skills, general intellectual ability, race, and later reading achievement.** *Reading Teacher*, 1970(Apr), Vol. 23(7), 660-668.—Extends previous findings concerning the predictive ability of the Seriation Test (ST), a test consisting of "varied and sequential tasks" designed to measure perceptual abilities. The Iowa Test of Basic Skills (ITBS) was administered to 151 3rd graders who were part of a previous population of 356 kindergartners from whom data had been obtained on the ST, Metropolitan Reading Readiness Test, and teachers' ratings. Correlation coefficients between the ITBS and various kindergarten measures indicate that: (a) there is a significant relationship between ST scores and 3rd grade reading success; (b) there is a lower predictive power of the ST for Negro than for Caucasian children; (c) "regardless of race, kindergarten children with an inadequate base of perceptual experiences are more likely to encounter reading difficulties"; (d) it is more difficult to predict reading achievement of Negro children, particularly girls, on almost all kindergarten

measures; and (e) teacher ratings, as opposed to objective tests, are more effective predictors of reading success for Negro girls and Caucasian boys, while the reverse is true for Negro boys and Caucasian girls.—R. Wiltz.

3070. Ward, Byron J. (Syracuse State School, N.Y.) **Two measures of reading readiness and first grade reading achievement.** *Reading Teacher*, 1970(Apr), Vol. 23(7), 637-639.—Correlated 278 kindergartners' scores on the WISC Coding subtest and the Murphy-Durrel Reading Readiness Test with their scores on the Stanford Achievement Test administered at the end of the 1st grade. Results indicate that the Murphy-Durrel Test scores were significantly more highly correlated with all but the Vocabulary subtest of the Stanford Achievement Test than were the WISC Coding subtest scores. Correlations between Murphy-Durrel Test scores and the Standard Achievement subtests ranged from .41-.55, while those between the WISC Coding subtest and Stanford Achievement subtests ranged from .28-.34. It is concluded that "the use of the Coding subtest as a predictor of reading achievement or reading success would appear to be severely limited."—R. Wiltz.

3071. Webb, Warren W. & Pate, John E. (Vanderbilt U.) **Predicting failure in the primary grades.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 459-462.—Early predictions of school difficulties over a long term could enhance educational and guidance programs. To study predictive accuracy over time, a paper-and-pencil group screening, the First Grade Screening Test (FGST), was administered to all beginning 1st graders in 1 school system. 3 yr. later, as they completed the 3rd grade, ratings by their teachers and their achievement test scores were grouped according to FGST scores obtained in the 1st grade. An FGST cutting score of 19 identified 84% of children who failed during the primary grades, and median achievement for those above the cutting score was 1.1 grade level higher than those below the cutting score. Results indicate that school difficulties over a 3-yr period can be predicted with some accuracy by this testing procedure during the beginning weeks of 1st grade.—*Journal summary*.

Overachievement & Underachievement

3072. Hollon, Thomas H. (Children's Development Center, Rockford, Ill.) **Poor school performance as a symptom of masked depression in children and adolescents.** *American Journal of Psychotherapy*, 1970(Apr), Vol. 25(2), 258-263.—Reported 4 cases which demonstrate that poor school performance (including lack of adequate study habits, poor attitudes, and unruly behavior) may possibly have its roots in depression which has become masked, and therefore misunderstood, by parents and school teachers. The depression may at times be caused by obvious reasons or may be more general and nebulous (i.e., depressive attitudes caused by feelings of inadequacy or inferiority). In all cases presented, this situation was rectified by a change in attitude on the part of the parents and school teachers and by referral for psychiatric treatment.—P. R. Shibleski.

3073. Mumpower, D. L. & Riggs, Sharon. (U. Southern Louisiana) **Overachievement in word accuracy as a result of parental pressure.** *Reading Teacher*, 1970(May), Vol. 23(8), 741-747.—Suggests that some children may respond to pressure by overachieving

in areas of rote learning, e.g., word accuracy, while failing to do as well in areas requiring a higher level of mental maturity, e.g., comprehension. Case studies of 33 children showing overachievement in Word Accuracy on the Gilmore Oral Reading Test were paired with case studies of 33 children showing no overachievement. Pairs were matched for age, sex, grade, IQ, MA, and race, and all Ss had achieved normal Comprehension scores. Case data relating to overachievement were categorized independently by 2 Es and were subjected to statistical analysis. It was found that overachievers were significantly more likely to be categorized as having parents who exert pressure for good grades, and as exerting much effort in school. 3 other factors approached significance, with overachievers more likely to be categorized as: (a) needing less pressure for school progress and less emphasis on grades, (b) showing signs of emotional disturbance related to school, and (c) having parents who don't understand or accept the child's limitations.—R. Wiltz.

CURRICULUM & PROGRAMS

3074. Avital, Shmuel M. & Shettleworth, Sara J. (Ontario Inst. for Studies in Education, Toronto, Canada) **Objectives for mathematics learning: Some ideas for the teacher.** *Ontario Institute for Studies in Education Bulletin*, 1968, No. 3, 57 p.—Discusses the belief that the central goal of mathematics instruction is ultimately "the development of the ability to utilize mathematical thinking in the solution of problems." A method is described of categorizing mathematics teaching objectives, based on the major levels (knowledge, comprehension, application, analysis, synthesis, and evaluation) of B. S. Bloom's classification of educational objectives. This method is adapted to describe the levels of mathematical performance more precisely.—P. McMillan.

3075. Avders, Z. & Krotova, T. **Na vysokom nauchno-professional'nom urovne.** [On a high scientific-professional level.] *Vestnik Vysshei Shkoly*, 1970, Vol. 28(2), 30-33.—Presents an account of the 1969 All-Union Interuniversity Scientific-Technical Conference on Problems of Scientific Organization of Work in Universities, held in Moscow. Titles and occasional brief summaries of a number of the papers read are included.—I. D. London.

3077. Clark, Ann D. (U. Wisconsin) **A longitudinal investigation of selected characteristics in an economically disadvantaged and nondisadvantaged Headstart population.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5310.

3078. Deskins, L. R. **Need/drive plus a system equals general educational development.** *Training & Development Journal*, 1970(Mar), Vol. 24(3), 30-32.—A company and a college developed a program to provide high school equivalency education to industrial workers. Each "participant attended 1 3-hr classroom session per wk. for 15 wk. in addition to 8-10 hr. of home study per wk. . . . The Stanford Achievement Test was adminis-

tered.... The instructors concentrated their efforts on increasing reading effectiveness, vocabulary, grammar, basic mathematics and an understanding of numerical concepts.... Of 45 enrollers, 7 qualified for high school equivalency without the course, 29 at the end of the course, and 8 failed.—C. A. Bennett.

3079. Goolsby, Thomas M. (U. Georgia) **Culturally deprived Head Start subjects' reading readiness after training in listening.** *Journal of Learning Disabilities*, 1968(Oct), Vol. 1(10), 561-564.—Presents evidence of reading readiness for 3 groups of 17, 18, and 13 nonreading, preschool, culturally deprived Head Start children after they received 3 types of training in listening. Pretreatment scores were established by playing 2 stories to each S, then questioning them. During training, Ss heard stories and then were either: questioned and told whether their responses were right or wrong, questioned with no feedback, or asked no questions. Posttreatment scores were determined in the same way that pretreatment scores were established. 5 wk. after the end of the experiment all Ss were administered the Metropolitan Readiness Test (MRT). Results show that differential treatment made no difference in mean performance in reading readiness as measured by the MRT. However, intercorrelations of treatment through the various phases of the group receiving both questions and feedback indicate that this type of treatment for culturally deprived children is more appropriate to what the MRT measures as reading and number readiness.—M. Maney.

3080. Greenberg, Herbert M., Rosmer, Lillian, & Slenta, Roland A. **The valuable legacy of failure.** *New York State Education*, 1967(Feb), Vol. 54(4), 29-31.—Reports on the Work, Education, Training Program in Rochester, New York, which capitalizes on the valuable background of "indigenous adults" as coworkers with conventional professionals in nursery school centers.—L. D. Summers.

3081. Jacobson, Edward S. (Drum Hill Junior High School, Peekskill, N.Y.) **Frontal attack on reading.** *New York State Education*, 1967(Feb), Vol. 54(4), 18-19.—Briefly describes and reports gains of 9 mo. or greater over a 7-mo period of intensified efforts in a developmental reading program.—L. D. Summers.

3088. Morgan, Robert F. & Toy, Thomas B. (Acadia U., Wolfville, Nova Scotia, Canada) **Learning by teaching: A student-to-student compensatory tutoring program in a rural school system and its relevance to the educational cooperative.** *Psychological Record*, 1970(Spr), Vol. 20(2), 159-169.—Before and after testing on the Wide Range Achievement Test (WRAT) over a 4-mo period assessed gains for student tutors and their pupils in a rural school system. 13 tutored 2nd-5th graders showed a mean net growth advantage of from 3-5 mo. on WRAT subtests over 14 controls. 10 8th-12th grade student tutors showed a mean 9 mo. edge over controls, a gain of 13 mo. over 10 controls. On the 3 WRAT subtests all experimental means exceeded control means, but only the reading subtest was significant at the 5% level. Implications discussed include suggesting a much more institutionalized role reversal between teacher and student, student tutoring, and an educational cooperative with graduated salaries and personal involvement for all participants. (18 ref.)—Journal abstract.

3089. Mosher, Ralph L. & Sprinthall, Norman A. (Harvard U., Graduate School of Education) **Psychological education in secondary schools: A program to promote individual and human development.** *American Psychologist*, 1970(Oct), Vol. 25(10), 911-924.—Presents a rationale for a new focus for curriculum. Recent studies have shown that the "hidden agenda" of schooling educates students' attitudes, values, and perceptions, and that personal/psychological education is taking place. Indirectly the student is learning to see himself, recognize his competence, and develop a sense of worth. It is suggested that, at minimum, the school reinforces the child in the psychological advantage or disadvantage with which he enters it. A new program of psychological education is outlined which

includes experience-based learning laboratories, peer counseling, cross-age teaching, improvisational drama, film and communication, and self-analytic groups. Such procedures call for a different approach to the problems of secondary schooling by direct focus on the personal education of the pupil as a curriculum objective. (28 ref.)—*Author abstract.*

D. London.*

Teaching Methods & Teaching Aids

3096. Asher, J. William. (Purdue U.) **Comment on "Spelling achievement following I.T.A. Instruction."** *Reading Teacher*, 1968(Nov), Vol. 22(2), 153-156, 169.—Critically examines A. J. Mazurkiewicz and P. A. Lamana's study which deals with the residual effects of

initial teaching alphabet (ITA) on spelling, once children have made the transition into traditional orthography (TO). It is demonstrated that firm conclusions, from this study, about ITA and TO teaching methods are prevented by: (a) errors in experimental design and statistical testing, (b) inadequate definition of populations and sampling methods, (c) inadequate description of the teaching methods and procedures that define the initial ITA and the TO methods, and (d) the unexplained variability in the data over time.—*G. Steele.*

3097. Bobbitt, Richard. **The development of music reading skills.** *Journal of Research in Music Education*, 1970(Sum), Vol. 18(2), 143-156.—"During the school year 1965-66, an experimental program to develop music reading skills in the elementary grades was begun in Brookline, Massachusetts . . . 1 35-min period of instruction per wk." was given to the about 20 Ss who "were selected after preliminary testing from members of 2 6th-grade homerooms in 1 school. The marked improvement in awareness of melodic structure encouraged the administration to expand the activity during the school year 1966-67. . . . The program terminated at the spring semester of 1967." Programed procedures are described, but no information on evaluation procedures or results is given.—*D. Higbee.*

3098. Breard, Claudine. (U. Rennes, France) **Psycho-pedagogie du calcul moderne au cours préparatoire.** [Modern mathematics in the first few grades.] *Information Psychologique*, 1968(Jul), No. 31-32, 5-34.—Presents several aids to teaching sets, unions and multiplication.—*S. G. Vandenberg.*

3099. Chastain, Kenneth D. (Purdue U.) **A methodological study comparing the audio-lingual habit theory and the cognitive code-learning theory: A continuation.** *Modern Language Journal*, 1970(Apr), Vol. 54(4), 257-266.—Reports a follow-up study which examined the effect of audio-lingual and cognitive language instruction in the 1st yr. on achievement in the 2nd yr. to determine if the trend favoring the cognitive method would be maintained or strengthened. Data were based on the Modern Language Aptitude Cooperative Test, Form MA scores for 31 of 48 audio-lingual students and 35 of 51 cognitive students who continued the courses in the 2nd yr. Grades in the 3rd and 4th semesters, which stressed reading and listening comprehension, were compared, and achievement scores in listening, speaking, reading, and writing were statistically analyzed with regard to variables of: previous language experience, instructor, sex, modality preference, aptitude, and motivation. Overall results show very little difference between the 2 methods at the end of the 2nd yr., although the direction of difference in reading continued to favor the cognitive group. In spite of a high drop-out rate, it is concluded that: (a) differences in achievement based on varying emphases in the 1st yr. tend to disappear as the stress is changed in the succeeding semesters; (b) as course objectives and teaching procedures change, the student ability factors affecting achievement also change, with motivation becoming a more significant variable; and (c) neither method is uniformly better for all students in language skills.—*C. O'Donnell.*

3100. Coop, Richard H. & Brown, Laurence D. (U. North Carolina) **Effects of cognitive style and teaching method on categories of achievement.** *Journal of Educational Psychology*, 1970, Vol. 61(5), 400-405.—Used a 2 x 2 factorial design to determine the effect

of cognitive style and teaching method on 3 different aspects of subject matter achievement—factual content, conceptual-generalization content, and total content. Data from 80 undergraduates indicate that a teacher-structured-presentation method of instruction was significantly superior to an independent-problem-solving method of instruction on all 3 dependent measures. There was no significant difference between Ss with an analytic cognitive style and Ss with a nonanalytic cognitive style on any of the dependent measures nor was there a significant interaction between cognitive style and teaching method. (19 ref.)—*Journal abstract.*

3106. Keitel, Helmut A. (Hamilton High School, Sussex, Wis.) *Development and dissemination of materials for the teaching of world history in a foreign language (German).* *Modern Language Journal*, 1970(Feb), Vol. 54(2), 112-115.—Attempted to reinforce newly acquired language skills in high school German. 2 control groups and 1 experimental group were selected on the basis of similar educational characteristics. The experimental group was formed of students who had never had history but had completed German II. Theses Ss took German III and World Cultures (in German). Control Group 1 had completed both courses and went on to German III. Control Group 2 who had had neither, enrolled in World Cultures (in English). The same teacher undertook instruction for all 3 groups. Data indicate that the experimental group achievements were equal to the control group in World Cultures. They were also superior to the control group in German. It is suggested that this method of language instruction has acted as an added incentive for further foreign language study.—C. O'Donnell.

3107. Kubeev, B. V. *Nuzhnye uchebnye fil'my.* [Necessary educational films.] *Vestnik Vysshei Shkoly*, 1970, Vol. 28(2), 44-45.—Describes films for university use on the orienting reflex, biocurrents in research, and localization of cerebral functions.—I. D. London.

3108. Mann, Lester, et al. (Montgomery County Schools, Norristown, Pa.) *Achievement and personality measurements associated with progress in a programmed course in decimals and fractions at a fifth grade level.* *Scientia Paedagogica Experimentalis*, 1968, Vol. 5(1), 76-83.—Administered the Elementary Arithmetic Series Decimal Numbers Self-Tutoring Course to 154 5th graders in addition to regular

arithmetic assignments to investigate the learning processes involved and the "degree and nature of the association between pupil progress and certain measures of achievement and personality style." Results indicate the direct association of IQ, as measured by the Henmon-Nelson Test of Mental Ability, and achievement, measured by a test provided by the course, to success in learning the programed text. General ability factors as opposed to specific ones were predictive of success. (French summary) (33 ref.)—G. Steele.

3109. Meiskin, Milton. (Central Elementary School, Mamaroneck, N.Y.) *Comfortable reading.* *New York State Education*, 1967(Feb), Vol. 54(4), 43.—From experiences in his school where he is principal, the author suggests that a quiet, comfortable corner for reading, furnished with pillows and cushions, is a valuable asset in an elementary classroom.—L. D. Summers.

3114. Nemeth, Joseph S. (Bowling Green State U.) *A personalized approach to comprehension.* *Journal of the Reading Specialist*, 1969(Mar), Vol. 8(3), 124-127.—Students nominated the most "difficult" textbook: *Life: An Introduction to Biology*. It was found to have a Dale-Chall readability level of Grade 14, while the Ss taking the reading course had a level of about Grade 10. This gap between the textbook and student reading level led to a research which showed that improved vocabulary led to improved comprehension and, consequently, better semester and examination grades. Ss were taught and/or reviewed 3 selected meaning skills—context, structure, and dictionary—which were "1st reinforced with commonly available commercial materials." Following this procedure, Ss were encouraged to apply their

new word meaning to biology reading assignments. As a result a scheme was developed which permitted Ss to select "important" words for further study and remembering. Selection of key words was accomplished by a student analysis of the vocabulary list in the recall and the interpretation level. The procedures and techniques are still being evaluated and refined.—*I. Sirotin.*

3115. Radan, George T. & Zuckowsky, Leo M. (Villanova U.) **Developing a multidimensional slide projector technique.** *Catholic Educator*, 1970, Vol. 40(5), 56-61.—Working within the limits of budgetary considerations, the techniques of psychology and the principles of the fine arts were applied to slide projection in the effort to provide the viewer with the environment stimulating the artist originally. 1 problem reported by viewers—distractions from auxiliary means—was eliminated by panel control and abolition of screens. Proper display of kinetic art was approached through splicing shots taken from different angles. It is concluded that the projection lamp can still serve, even in the presence of many more modern and more expensive mechanical provisions.—*A. M. Cawley.*

3116. Radan, George T. & Zuckowsky, Leo M. (Villanova U.) **Is slide projection dead?** *Catholic Educator*, 1969, Vol. 40(1), 64-69.—Presents the background on mixed media, the problems facing most educational organizations in attempting to make use of the latest aids available, and leads up to an experiment designed to demonstrate more effective utilization of slides.—*A. M. Cawley.*

3117. Rives, James A. (U. Saskatchewan, Regina, Canada) **A comparative study of traditional and programed methods for developing music listening skills in the fifth grade.** *Journal of Research in Music Education*, 1970(Sum), Vol. 18(2), 126-133.—Ss were students at 2 schools in New Mexico, 1 of the Mescalero Apache Indian Reservation (N = 37), the other in Tularosa with an Anglo-American and Spanish-American student body (N = 72). No differences in listening achievement were found between 12 wk. of programed instruction and traditional methods, but Caucasians scored significantly higher than Indians.—*D. Higbee.*

3118. Rogers, Kirby & Almond, Frank. (Brunswick Junior Coll.) **A bibliography of materials on programed instruction in music.** *Journal of Research in Music Education*, 1970(Sum), Vol. 18(2), 178-183.—Entries, dating from January 1957–November 1967, include programed texts and research reports.—*D. Higbee.*

Maryland) **Programed instruction: A comparison of learning and retention of information learned through the use of small step (linear) programed instruction and large step (branching) programed instruction.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5266.

3120. Shuy, Roger W. (Center for Applied Linguistics, Sociolinguistics Programs, Washington, D.C.) **Some considerations for developing beginning reading materials for ghetto children.** *Journal of Reading Behavior*, 1969(Spr), Vol. 1(2), 33-43.—Examines the differences between the written text of beginning reading materials and the oral language of the inner city Negro children, and emphasizes the importance of the child's underlying language structure, which is increasingly relied upon throughout the reading process. It is suggested that 3 principles be considered when developing reading materials for ghetto children: (a) grammatical forms which are not used in the oral language

should be avoided; (b) grammatical forms which are not commonly found in the readers, but which are used in the oral language, should be inserted; and (c) grammatical forms should be in sequences similar to those of the oral language. Consideration of these principles is expected to contribute to the solution of reading problems produced by the behavioral mismatch of reading materials and the cultural position of ghetto children.—*R. Wiltz.*

3121. Standifer, James A. (Temple U.) **Effects of aesthetic sensitivity of developing perception of musical expressiveness.** *Journal of Research in Music Education*, 1970(Sum), Vol. 18(2), 112-125.—1 semester courses in general music taught by persons "well trained in the methods of teaching music courses based on principles of absolute expressionism" were offered in 3 junior (N = 17 in each) and 3 senior (Ns = 17, 23, and 11) high schools "selected to represent the widest available socioeconomic range." Experimental Ss "received pretests, new music instruction, and posttests. The control groups received traditional music instruction (by teachers already employed at the particular schools) and posttest only." Results are interpreted to suggest that "strong interaction effects existed between socioeconomic levels and treatment, the treatment favoring the child of the lower socioeconomic level," perhaps because of "the challenging nature of the new music course" for students who lacked such challenge in other courses, as well as a kind of "Hawthorne effect."—*D. Higbee.*

3122. Treviño, Bertha G. (Laredo Junior Coll.) **Bilingual instruction in the primary grades.** *Modern Language Journal*, 1970(Apr), Vol. 54(4), 255-256.—Discusses a program which attempted to compensate for poor scholastic achievement of Mexican-American children by using bilingual instruction for all students in the 3 primary grades. The project encouraged a self-help program on the part of the students. Raw arithmetic scores on the California Achievement Test for children completing 3 yr. of bilingual instruction were converted into grade placement equivalents. Results show that only 1 Spanish-speaking child fell below the national norm in basic arithmetic. It is suggested that the solution to low achievement for Spanish-speaking children may be found through the use of Spanish in the primary grades. It is also proposed that a 2nd language may be taught in the primary grades without hampering the normal achievement of any child.—*C. O'Donnell.*

3123. Wolff, Edgar. **Pour une révolution radicale dans les méthodes d'enseignement des grandes classes au lycée.** [Towards a radical revolution in the methods of teaching large high school classes.] *Information Psychologique*, 1969(Jan), No. 33, 45-48.—Proposes a system of electives, of optional attendance, more free study, and classes of 30 min. only.—*S. G. Vandenberg.*

3124. Wood, Fred H. **The McCluer Plan: An innovative non-graded foreign language program.** *Modern Language Journal*, 1970(Mar), Vol. 54(3), 184-187.—Describes an experimental French and Spanish program designed to eliminate the exceptionally high drop-out rate and to compensate for the overemphasis on pseudolanguage in current methods. The McCluer curriculum used at a suburban high school stressed individual performance through small group activities and team teaching. 4 basic skills are concentrated on individually in the new audio-lingual approach: comprehension, speaking, reading, and writing. "Each unit is

divided into 3 phases: (a) comprehension, (b) vocalization, and (c) assimilation and consolidation of skills." The change in the role of the teacher and student, the different methods of presenting materials, and changes in facilities and timing are stressed. It is indicated that such unstructured settings may develop problems, but concluded that modification of the "McCluer Plan" may provide the answers for the problems in current foreign language instruction.—C. O'Donnell.

PERSONNEL & INDUSTRIAL PSYCHOLOGY

3125. Benoy, Leroy W. (211 Glendale Ave., Highland Park, Mich.) **Prevention of deafness from industrial noise and acoustic trauma.** *Journal of the American Osteopathic Association*, 1968(Oct), Vol. 68(2), 161-167.—Cites proof that noise does produce high frequency hearing loss. Instruments are currently available for determining whether or not noise in a given industrial plant is at a hazardous level; it is stressed that these should measure the components of different frequencies present in noise. Hearing conservation programs have been established by employers of more than 1/3 of those persons working in hazardous noise areas. Such programs attempt to conserve hearing and prevent hearing loss among workers, prevent economic loss to the company, and gather scientific information. Ideally, they would also involve the removal of noise at its source, by direct treatment of noise-generating machines and devices and by acoustic treatment of work areas. In areas where noise levels cannot be effectively reduced by currently available methods, specially designed ear devices can be worked to protect the hearing of the worker. The medical aspects of these devices are explored with attention to anatomic, physiologic, and psychologic considerations.—*Journal abstract*.

3126. Otto, C. P. & Glaser, R. P. **How to prepare and present a training forecast.** *Training & Development Journal*, 1970(Mar), Vol. 24(3), 24-29.—The "training director must develop a plan of action to direct the resources of his department to assist the institution in reaching its goals. . . ." To do this he must get information from everyone about his organization, identify training needs, evaluate present capabilities, and develop a written, costed forecast. The relationship of programs to organizational objectives should be considered.—C. A. Bennett.

3127. Salas, R. G. (Psychological Research Unit, Albert Park Barracks, Melbourne, Australia) **A survey of attitudes held towards the Royal Australian Army Nursing Corps: I. Regular officer and civilian attitudes.** *Australian Military Forces Research Report*, 1969, No. 3 69, 44p.—Surveyed the opinions of 309 female officers in the nursing corps on topics thought to be of relevance in the formation of attitudes towards conditions of service and the reappointment decision. 254 final year civilian nursing trainees were polled to establish base-line attitudes towards career expectations and needs, and to reveal general attitudes towards nursing in a military setting. Both samples were found to be closely similar in their stated basic career needs, the main requirements being a sense of achieving progressive professional development and one of providing community service. A substantial proportion of both samples

was negatively oriented towards long-term contractual employment, strongly favoring a shorter initial term of service of a probationary nature. In terms of reappointment, data from the officers fell into the pattern observed in studies made on male, other-rank soldiers.—*Journal abstract*.

3128. Schultz, Duane P. (Ed.) (U. North Carolina) **Psychology and industry.** London, England: Macmillan, 1970. x, 513 p.—Contains a series of articles by various authors designed as a text supplement for undergraduate courses dealing with the contribution of psychology to the understanding of man and his job. Focus is given to the daily activities of psychologists in industry, including the techniques they use and the problems they encounter.

3129. Aldag, Jean C. (Washington U.) **Male nurse interest and personality characteristics.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5672.

3130. Gilbert, Albin R. (West Virginia Wesleyan Coll.) **Superiority of latency-weighted scores over unweighted scores in the assessment of professional interests.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 93-94.—Scores obtained from latency-weighted testing of 66 preministerial Ss correlated significantly with projective incomplete-sentence scores (.55) but not with paper-and-pencil scores (.05) in assessing professional suitability. The latency-weighted scores provided increased diagnostic value in responses to interest-inventory items.—*Journal abstract*.

3131. Harmon, Lenore W. (U. Wisconsin, Milwaukee) **Strong Vocational Interest Blank profiles of disadvantaged women.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(6), 519-521.—Explored the use of the SVIB with disadvantaged women by pattern analysis of the profiles of 25 women participating in 2 special programs. Most of the profiles had identifiable interest patterns but the majority of the women had high scores on the Medical Service and Nonprofessional Occupational groups. At the scale level, considerable diversity was noted among women who had high scores on the Nonprofessional Group of occupations. It is concluded that the SVIB can be useful in recognizing individuality in disadvantaged women and in helping them to choose satisfying job training experiences.—*Journal abstract*.

3132. Holland, John L., Whitney, Douglas R., Cole, Nancy S., & Richards, James M. (American Coll. Testing Program, Iowa City, Ia.) **An empirical occupational classification derived from a theory of personality and intended for practice and research.** *ACT Research Report*, 1969(Apr), No. 29, 22 p.—Presents the origin, development, verification, and revision of an occupational classification. Occupations are organized according to their degree of psychological relatedness following J. Holland's theory of personality. Because of its theoretical simplicity and empirical base, the classification has many potential practical applications for vocational guidance, industrial personnel work, and research in education, psychology, and sociology.—*Journal abstract*.

3133. Silver, Harvey A. & Barnette, W. Leslie. (Dept. of Manpower, Ontario Region, Toronto, Canada) **Predictive and concurrent validity of the Minnesota Vocational Interest Inventory for vocational high school boys.** *Journal of Applied Psychology*, 1970(Oct),

Vol. 54(5), 436-440.—Presents the 2nd and final report on a 4-yr follow-up of vocational high school boys to check on the validity of the Minnesota Vocational Interest Inventory. 438 freshman and senior students were administered the inventory. Multivariate statistical analyses showed excellent classification accuracy in terms of 3 large trade curricula in which distinct inventory patterns emerged for each group. For these Ss a rather remarkable stability of occupational choice was demonstrated.—*Journal abstract.*

SELECTION & PLACEMENT

3134. Amir, Yehuda; Kovarsky, Yacov, & Sharan, Shlomo. (Bar-Ilan U., Ramat-Gan, Israel) **Peer nominations as a predictor of multistage promotions in a ramified organization.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 462-469. Studied the validity of peer nominations (PNs) as a predictor of advancement in rank in the Israel Defense Forces on a population of 125 platoons encompassing 3897 soldiers. Results indicate that PNs obtained at early stages of training predicted promotion at several successive stages in the soldier's military career with a high degree of validity and correlations generally around .6 and .7. Predictions were valid for success within groups of different personnel, and with different purposes, and criteria for achievement. PNs were also found to contribute markedly to the predictive validity of conventional psychological screening measures, suggesting the value of combining psychometric and sociometric procedures for personnel selection. (16 ref.) *Journal abstract.*

3135. Laurent, Harry. (Esso Europe Inc., London, England) **Cross-cultural cross-validation of empirically validated tests.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 417-423.—4 tests, 2 biographical information blanks (BIBs), the management-judgment test, and the Guilford-Zimmerman Temperament Survey, empirically validated on 443 United States managers, were administered to approximately 800 employees in companies in Norway, Denmark, and the Netherlands. All standard deviations were significantly larger and all means except 1 were higher in the United States sample. Correlations between all test scores and a criterion of success were significant at the .01 level for the 4 samples. The management-judgment test correlated significantly higher with the criterion in the United States than in 1 European sample. 1 BIB correlated significantly higher in Denmark and Norway samples than in the United States. None of the other 21 comparisons of correlations showed a significant difference. Possible explanations for the consistency of results are discussed. *Journal abstract.*

3136. Richardson, J. F. **The relationships of some measures of candidate personality to selection or rejection by an OTU selection board.** *Australian Military Forces Research Report*, 1969(Jan), No. 1-69, 26 p.—Examined the relationship between scores on the scales of the 16 PF, Eysenck Personality Inventory (EPI), interpersonal checklist (ICL), Closure Flexibility Test, and selection for officer training by the Officer Training Unit Selection Board. Few significant correlations were found. 84 items, which correlated with the criterion, were identified from the 16 PF, EPI, and ICL. When only these items were scored, correlations of .58, .40, and .43 were found. A correlation of .56 was obtained for all items together.—*Journal abstract.*

3138. Stewart, Robert D. **How to manage your injury problem.** *Personnel Journal*, 1970(Jul), Vol. 49(7), 590-592.—Greater utilization of preemployment physical examinations could make it possible for companies to predict, and avoid, workers likely to be subject to injury or illness. 1 company reduced back-injury claims by 93%.—*Journal abstract.*

TRAINING

3139. Jurgensen, C. E. **Personality characteristics of training directors.** *Training & Development Journal*, 1970(Jun), Vol. 24(6), 15-20.—Describes a technique known as "adjective work sort," which consists of 120 adjectives which are sorted by respondents in terms of how they believe ideal or typical members of occupational groups are, are not, or should be. Although "the technique was without value as a test of personality, it did provide insights and data useful for the study of value judgements . . ." Results are described for various target groups, such as executives, as described by various groups, such as psychologists and executives.—C. A. Bennett.

3140. Krag, E. & Van Brunt, R. E. **Training clerical help.** *Training & Development Journal*, 1970(Jul), Vol. 24(7), 36-39.—Programed audiovisual instruction with tutorial support has proven successful in training typists from personnel previously thought unqualified. A "systems approach" to the problem is described. Sets of cassette tapes and published materials are used. Instruction can be given at any time for any duration. Each student works at an individual station. It is stated that almost without exception students have succeeded in a variety of jobs and have liked the instructional program.—C. A. Bennett.

3141. Lanman, Richard W. (Purdue U.) **The construction of a forced-choice test for industrial trainers.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5676.

3142. Maistriau, R. & Besure, J. (Royal Military School, Brussels, Belgium) **Le synergometre, instrument de formation des jeunes officiers: III.** [The synergometer, an instrument for the training of young officers: III.] *Information Psychologique*, 1969(May), No. 34, 5-38.—Presents details about the messages transmitted and their analyses.—S. G. Vandenberg.

3143. Maistriau, R. & Besure, J. (Royal Military School, Brussels, Belgium) **Le synergometre, instrument de formation des jeunes officiers.** [The synergometer, an instrument for the training of young officers.] *Information Psychologique*, 1968(Jul), No. 31-32, 67-122.—Synergometer is the name given to a technique designed to teach improvement in interpersonal communication. Data are reported on its use with military personnel. Also given are the full text of 3 questionnaires dealing with the individual's reactions to the training sessions, as well as 3 interviews with a trainee. No outside criterion was used to establish the value of the technique.—S. G. Vandenberg.

3144. Mann, E. K. **Sensitivity training: Should we use it?** *Training & Development Journal*, 1970(Mar), Vol. 24(3), 44-48.—"There is evidence that sensitivity training modifies interpersonal behavior, and even some evidence

that some changes are personally beneficial, but no evidence of the organizational efficacy of sensitivity training was found... its chances of inducing a desirable change are much reduced for lack of proper reinforcement of learning... the techniques of T-Group training offer little likelihood of inducing a specific desired change in a given individual... Because sensitivity training is a high-cost, low-effectiveness method, other means of improving interpersonal relationships should be given due consideration... sensitivity trainees should not undergo the experience in the company of their normal work group...."—C. A. Bennett.

3145. Papaloizos, A. & Nicholls, J. R. An approach to measuring the effectiveness of participative methods in teaching managerial skills. *Training & Development Journal*, 1970(Jun), Vol. 24(6), 10-14.—Traditional management training emphasized teaching knowledge; today more emphasis is being given to skills and attitudes. 7 skills are described; e.g., formulating solutions. Various ability schemes and tests, e.g., those of Guilford and Torrance, are described and suggested as useful in measuring management skills.—C. A. Bennett.

3146. Plag, John A., Goffman, Jerry M., Murphy, Lester E., & Bowen, George R. The military effectiveness of Navy airmen enlistees. *USN Medical Neuropsychiatric Research Unit Report*, 1969(Jul), No. 69-25, 19 p.—Compared airmen and nonairmen (N = 10,369) on the basis of biographical data, cognitive test scores, recruit training performance, and fleet effectiveness during their 1st enlistments. Formulas were derived for predicting effectiveness for both groups separately in order to ascertain whether occupational assignment might have a moderating effect upon the validities obtained. It was found that: (a) airmen have a significantly higher rate of effectiveness than nonairmen, although the difference between the groups is not large; (b) reenlistment rates and the percentage of Ss attending service schools are approximately the same for the 2 groups; (c) airmen possess higher cognitive abilities than nonairmen and more frequently give a history of prior military service; and (d) assignment to the aviation specialty does not have the effect of moderating predictions of military effectiveness. *Journal abstract*.

3147. Rowland, A. D. Training EDP maintenance and operation personnel. *Training & Development Journal*, 1970(Jun), Vol. 24(6), 32-34.—Data were obtained for 150 students taking 1 of 6 computer maintenance and operation courses. Class grades were correlated with age, family location, extent of formal education, major field of study, and years and nature of digital equipment experience. Of the individual coefficients only, training in electrical engineering or not correlated significantly (.26) with grades. The multiple correlation for 4 variables was .44.—C. A. Bennett.

3148. Shaw, M. E. & Keller, V. F. Syrupy sweet. *Training & Development Journal*, 1970(Mar), Vol. 24(3), 4-8.—Industry is making an attempt to use minority group members and "in doing so, a tradition of conscious and unconscious racism and class distinction has to be dealt with...." Training efforts have focused on supervisors. 3 approaches are described: (a) confrontation which usually involves the creation of a situation where the supervisor comes face to face with a member of a minority group; (b) education tries to teach what it is like to be a minority group member; and (c) an approach dealing with behavior rather than attitudes,

which tries to train the supervisor how to deal with problems which may arise.—C. A. Bennett.

3149. Stapleton, R. N. The trainer in community development: Adult education in three different cultures. *Training & Development Journal*, 1970(Jun), Vol. 24(6), 42-44.—Describes 3 training incidents from experience with the American Field Service. The 1st indicates superior results (in Mexico) where volunteers help communities do whatever the community wants to do. The 2nd describes the renewal of a Hawaiian custom of talking out differences. The 3rd involved the use of a "fishbowl" technique wherein 2 conflicting California community groups—Negroes and Mexicans—were confronted in a special way, to resolve differences.—C. A. Bennett.

3150. Stewart, W. J. Determining first-line supervisory training needs. *Training & Development Journal*, 1970(Apr), Vol. 24(4), 12-19.—To "provide a more effective basis for determining 1st-line supervisory training needs... 717 supervisors... [were administered] a questionnaire consisting of 120 tasks... "High importance tasks included such items as, discuss job related problems with my boss, and involvement in training new employees. Those "tasks concerned with human involvement and understanding emerged as significant areas of 1st-line supervisory training need...."—C. A. Bennett.

TASK & WORK ANALYSIS

3151. Colquhoun, W. P., Blake, M. J., & Edwards, R. S. (Medical Research Council, Cambridge, England) Experimental studies of shift-work: III. Stabilized 12-hour shift systems. *Ergonomics*, 1969(Nov), Vol. 12(6), 865-882.—Attempted to determine whether the relationship between efficiency at mental tasks and the circadian rhythm of body temperature previously observed was affected by an increase in the length of the duty spell from 8-12 hr. using 22 Ss. Ss were assigned either to a control day or night shift and were tested for a period of 12 consecutive days on the same shift. Some signs of fatigue due to the excessive length of the duty-spell were observed, but an underlying relationship between temperature and performance remained in evidence in some scores throughout the trial period. Adaptation of temperature rhythm to work on the night shift was only partial, and less marked than in a previously studied night work situation; the partial adaptation was nevertheless relatively closely reflected in the recorded performance trends. It is concluded that the results demonstrate that, within certain limits, the relationship between temperature and efficiency warrant further research into its generality. (German & French summaries)—*Journal abstract*.

3152. Dean, Robert D. (Purdue U.) The effects of automation on skill requirements: Seven case studies. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5730.

3153. Gilbertová, Sylva & Beneš, Václav. Možnosti stanovení kritérií pro hodnocení práce. [Determination of criteria for assessing monotonous work] *Studia Psychologica*, 1970, Vol. 12(1), 60-68. Developed a personal inventory method, enabling a semiquantitative rating and applied it in production plants involving technology of a related nature. The temporal criterion alone was not reliable enough to classify the degree of work monotony unless it was supplemented with data on

the achievement structure of the operations. Non-technical and organizational factors in production (age, working situation) may be considered as reinforcing but not causal agents in monotony. Subjective aspects of monotony and employees' relation to changes in operations are also analyzed. (Russian summary)—*English summary*.

3154. Tomeković, T., Stajnerberger, I., & Sulejmanović, G. (U. Belgrade, Yugoslavia) **Mutual rating among workers as a measure of their merit to their work group.** *Human Relations*, 1970(Apr), Vol. 23(2), 153-164.—Applies the method of mutual rating to conditions of worker self-government in a lathe operators' shop. Significant differences were found between estimates of independent, mutual rating and payment base lines, and between indices of personal income and the same base lines. Difference between estimates of rating and indices of net personal income were not significant. Independent, mutual rating among workers is a more objective procedure for determining the base line for personal income as a basis for distribution of net income.—*W. W. Meissner*.

3155. Tomeković, Tomislav; Stajnerberger, Ivan, & Sulejmanović, Galib. (U. Belgrade, Yugoslavia) **Mutual rating among workers as a measure of their merit to their working group (unit).** *Studia Psychologica*, 1970, Vol. 12(1), 34-45.—Attempted to verify the efficiency of a mutual rating method for determining base salary among lathe operators. Results indicate (a) a significant difference between the salary determined by independent mutual rating and the existing base salary, (b) a significant difference between wages paid for hr. of labor and base salary, and (c) no significant differences between the rated salary and wages actually received for labor. It is concluded that mutual rating by workers is the most objective procedure in determining the base salary for each position and in turn for the distribution of net income realized by the whole group. (Czech & Russian summaries)—*Journal abstract*.

PERFORMANCE & JOB SATISFACTION

3156. Burke, R. J. **Characteristics of effective performance appraisal interviews: I. Open communication and acceptance of subordinate disagreements.** *Training & Development Journal*, 1970(Mar), Vol. 24(3), 9-12.—Attempted "to determine the influence of 2...attitudinal variables (openness of communication, supervisory reactions to subordinate differences and disagreements) on (1) selected performance review characteristics, and (2) satisfaction with the interview and subsequent job performance improvements.... The data were obtained in a questionnaire survey conducted in 6 offices of a large public utility.... All members of the respondent sample (to a questionnaire) were female telephone operators...." Correlations are presented which suggest that: "Respondents who felt completely open in their communications to their superior, or felt their superior was open in her communication to them, had significantly more favorable responses on the various measures of performance appraisal interview characteristics and outcomes...."—*C. A. Bennett*.

3157. Elizur, Dov. (Bar Ilan U., Ramat Gan, Israel) **Adapting to Innovation: A facet analysis of the case of the computer.** Jerusalem, Israel: Jerusalem Academic Press, 1970. 215 p.

3158. Friedlauder, Frank & Pickle, Hal B. (Case Western Reserve U.) **Employee and societal satisfactions provided by organizations in different industries.** *Personnel Journal*, 1970(Jul), Vol. 49(7), 577-582.—Of 6 types of organizations (food stores, restaurants, personal service organizations, gasoline service stations, wholesale trade organizations, and manufacturing firms) studied, personal service organizations provided the greatest satisfactions to employees. Not easily explained is the lack of differences among the 6 in terms of the fulfillment of societal satisfactions.—*Journal abstract*.

3159. Gruenfeld, Leopold W. & Weissenberg, Peter. (Cornell U.) **Field independence and articulation of sources of job satisfaction.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 424-426.—Hypothesized that analytic (field independent) and global (field dependent) perceivers would differ in their ability to differentiate among intrinsic and extrinsic sources of job satisfaction. Ss were 96 civil service supervisors who completed a Group Embedded Figures Test and the Wernimont job-satisfaction questionnaire. Results show that for global perceivers intrinsic and extrinsic satisfactions correlated substantially with each other and with overall job satisfaction while for analytical perceivers intrinsic and extrinsic satisfactions were independent and, as expected, only intrinsic satisfaction correlated with overall job satisfaction.—*Journal abstract*.

3160. Hall, Douglas T., Schneider, Benjamin, & Nygren, Harold T. (Yale U.) **Personal factors in organizational identification.** *Administrative Science Quarterly*, 1970(Jun), Vol. 15(2), 176-190.—Studied the personal dynamics of the process of organizational identification in the United States Forest Service, an organization noted for the high degree of organizational identification of its members. Questionnaires were completed by 156 (of 200 contacted) foresters. It was hypothesized and found that identification increased as a function of time and commitment to a pivotal organizational goal, public service. Organizational position, with tenure held constant, did not relate to identification. It was further found that several personal characteristics suggestive of a service orientation were related to identification. It was also hypothesized and found that identification is related to the member's higher-order need satisfaction. (70 ref.)—*Journal abstract*.

3161. Jansen, R. **Job enrichment: Challenge of the 70's.** *Training & Development Journal*, 1970(Jun), Vol. 24(6), 7-9.—Numbers of young people employed are increasing, job tenure is decreasing, especially among the young, and past work motivation schemes have failed. It is suggested that "it is the work itself that might be the problem and the key to job satisfaction." Several programs to restructure jobs to make them more challenging and satisfying are mentioned. Aspects of job enrichment include achievement, responsibility growth, and learning.—*C. A. Bennett*.

3162. Klein, Stephen P. (Purdue U.) **Life history and ability correlates of mechanical ingenuity.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5676.

3163. Maher, John R. & Piersol, Darrell T. (IBM, Armonk, N.Y.) **Perceived clarity of individual job objectives and of group mission as correlates of organizational morale.** *Journal of Communication*, 1970(Jun), Vol. 20(2), 125-133.—Lack of clarity on the

part of an employer regarding his own job or the mission of his location, it was assumed, would have significant negative consequences. It was hypothesized that the lack of clarity of (a) job objectives would be negatively related to job satisfaction and overall satisfaction, and (b) location of mission would be negatively related to job satisfaction, overall satisfaction, and perceptions of organizational cohesiveness (both intra- and inter-departmental). All predicted relationships were obtained.—*Journal abstract.*

3164. **Plag, John A., Goffman, Jerry M., & Murphy, Lester M.** The military effectiveness of naval enlistees serving as medical specialists. *USN Medical Neuropsychiatric Research Unit Report*, 1969(Nov.), No. 70-4, 30 p.—10,369 enlistees who entered the naval service and subsequently graduated from recruit training were divided into 2 groups—those assigned to medical specialties and those assigned to other occupational ratings. The 2 groups were compared on the basis of biographical data, cognitive test scores, rate of effectiveness, and rate of reenlistment. Formulas were derived for predicting effectiveness for all enlistees and for the medical specialists alone. These formulas were compared to ascertain whether assignment as a medical specialist might have a moderating effect upon the predictive validities obtained. It was found that: (a) medical specialists have a higher rate of effectiveness than enlistees in other occupational specialties or in general duty billets, (b) the rate of reenlistment is higher for medical specialists than for nonmedical personnel, and (c) the prediction of effectiveness for medical specialists is not enhanced through the use of variables uniquely valid for that group. The most valid prediction of the effectiveness of medical specialists utilizes the same variables which are valid for predicting the military effectiveness of all enlisted personnel.—*Journal abstract.*

3165. **Salas, R. G.** (Psychological Research Unit, Albert Park Barracks, Melbourne, Victoria, Australia) **Scaling the satisfaction of female officer and other-rank members with life in the Royal Australian Army Nursing Corps.** *Australian Military Forces Research Report*, 1969, No. 5-69, 13 p.—The questionnaire successfully discriminated between groups which were either favorably or unfavorably motivated towards continuing service after their present term expired. 2 tentative scales of satisfaction with Army life were derived from the questionnaire items, 1 for officers and 1 for other rank members. Results from 2 other experimental instruments are also analyzed and discussed.—*Journal abstract.*

3166. **Scharinger, D. H.** **Performance appraisal: A means or an end.** *Training & Development Journal*, 1970(Mar), Vol. 24(3), 52-53.—Performance appraisal and merit rating have given rise to more writing and discussion than almost any other area in management development. "Managers today do not fully accept development responsibility of identifying and communicating need through performance appraisal.... The chief criticism of formal appraisal is that it eliminated informal day-to-day appraisal.... It should not have any implications or ramifications of salary or promotion.... Thought should be given to establishing 3 types of appraisal—1 for development purposes, another for salary and a 3rd for promotion...."—C. A. Bennett.

3167. **Soliman, Hanafi M.** (Bradley U.) **Motivation-hygiene theory of job attitudes: An empirical inves-**

tigation and an attempt to reconcile both the one- and the two-factor theories of job attitudes. *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 452-461.—Tested methodological issues of the motivation-hygiene theory of job attitudes and attempted to reconcile this theory with traditional theories of job attitudes. 98 adult Ss responded to the Herzberg method of questioning, and completed the Job Description Index (JDI). Correlation of responses provided no support for the motivation-hygiene theory. Responses from same Ss to Porter's technique of measuring need-fulfillment deficiency (as a measure of the environment), and the Brayfield and Rothe index of job satisfaction (as a measure of overall job satisfaction) were also collected. Results partially support the hypothesis that 1- and 2-factor theories of job attitudes can be reconciled. When the environment (organization) provides adequately for the satisfaction of all kinds of needs, the motivators become more powerful sources of satisfaction than hygiene factors. If the environment deprives people of all kinds of needs, hygiene factors become more powerful sources of dissatisfaction than motivators. (53 ref.)—*Journal abstract.*

3168. **Tupes, Ernest C. & Madden, Howard L.** (U.S. Air Force Human Resource Lab., Lackland Air Force Base, Tex.) **Relationships between college characteristics and later performance of college graduates.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 273-282. Examined relationships between 36 college characteristics and the performance of 9000 Air Force ROTC graduates on 7 criteria. Among these criteria were retention and graduation rates. A series of multiple correlation analyses revealed Astin's college variables to be related to all 7 criteria; college type and control, to 4 criteria; and geographical area, to 1 criterion. Air Force ROTC graduates from colleges with less selectivity and lower aptitudes tended to be more successful as pilots or navigators ($r = -.77$).—N. M. Chansky.

3169. **Ypma, Edward G.** (Purdue U.) **Prediction of the industrial creativity of research scientists from biographical information.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5731-5732.

MANAGEMENT & ORGANIZATION

3170. **Bureš, Zbyněk.** (Charles U. Inst. of Psychology, Prague, Czechoslovakia) **Psychologické přístupy k rozboru práce vedoucího pracovníka.** [Psychological approach to the analysis of the manager's work.] *Psychologie v Ekonomické Praxi*, 1968, No. 3-4, 123-135.—Considers 3 psychological approaches to the analyses of a manager's work: (a) research of desirable traits, (b) analysis of social relations at the working place, and (c) analysis of manager's performance. The 3rd approach, which is divided into a direct and indirect one is emphasized. The indirect approach concerns the analysis of the industrial systems within which the manager fulfills his tasks, especially his participation in the complex management process, the manager's role in a certain system of working with people, and the creation of organizational prerequisites for successful management of his own section. The direct approach includes various types of job analyses and studies, and the evaluation of managers by the critical incident method. The exacting nature of any psychological study of the manager's performance, and the fact that the methods of

study so far have not been finalized are stressed. (German & Russian summaries) (22 ref.)—*English summary*.

3171 Gerson, Michael J. (Illinois Inst of Technology) **Need-pressure interaction as related to relevant industrial criteria.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-B), 5674.

3172 Hilgert, Raymond L. (Washington U.) **The role of environment and sentiments in inter-union behavior patterns.** In W. J. Wasmuth, R. H. Simonds, R. L. Hilgert, & H. C. Lee, *Human resources administration. Problems of growth and change*. (See PA, Vol. 45 Issue 2) 252-267.

3173 Peter, M. W. (State U. New York, School of Management, Buffalo) **Management styles in a multinational oil company.** *Personnel Practice Bulletin*, 1969(Jun), Vol. 25(2), 88-99—A study in a large international company found there was a clear divergence between the actual managerial styles and the approach managers regarded as ideal. The consultative participative style was found to be the most effective regardless of nationality, age, length of service, or field of specialization. A. De Palma.

3174 Wasmuth, William J., Simonds, Rolf H., Hilgert, Raymond L., & Lee, Hak C. (Cornell U.) **Human resources administration: Problems of growth and change.** Boston, Mass.: Houghton Mifflin, 1970. x, 426 p. \$5.50(paper).

SPECIAL ENVIRONMENTS

3175 Clarke, Neville P., Wolff, Walter M., Gokelman, John J., & von Gierke, Henning L. (Aerospace Medical Research Lab., Wright-Patterson Air Force Base, O.) **Simulation of aerospace flight acceleration and dynamic pressure environments for biodynamics research.** *Journal of Spacecraft & Rockets*, 1967(Jun), Vol. 4(6), 751-757—Describes a 6-degree-of-freedom motion device, operating in the 0-30 cps range to produce complex vibrations with peak loads up to ± 15 g; a dynamic pressure chamber (that will create wind pressure fluctuations of up to 172 db in the 0-100 cps frequency range) and a dynamic escape simulator (a sophisticated centrifuge) that will permit superpositioning of sustained acceleration of up to 20 g's with high-magnitude complex angular and linear motion and a wide range of atmospheric pressures and temperatures which are now under construction. A design study on a horizontal impact research device has been completed. The specific design characteristics and performance range of these devices are compared to the environments produced by operational conditions and to existing laboratory simulation facilities. (22 ref.)—*Journal abstract*.

3176 Larry, Clarence. (Boeing Co., Seattle, Wash.) **Effects of prismatic characteristics of aircraft windshields on pilot performance.** *Journal of Optometry & Archives of American Academy of Optometry*, 1968(Dec), Vol. 46(12), 921-929—Flight tested 2 windshields with exaggerated prismatic characteristics to determine their effect on a pilot's ability to land a 4-engine jet aircraft while flying under visual flight rules. 1 windshield contained a wedge of approximately 2.25 Wedginess in the 2nd windshield varied in direction and magnitude from approximately .1-1A. Generally, both windshields caused visual scenery to be displaced downward and to the left. Subjective and objective measures were used to

record the performance of 2 senior test pilots during the approach and landing phase of flight. Analysis indicates that the variable prismatic windshield (1-1A) had greater negative effect on pilot performance than the linear prismatic one (2.2A).—*Journal abstract*.

3177 Naitoh, P., Townsend, R., & Greenwood M. **Sleep requirements of man-in-the-sea.** *USA Medical Neuropsychiatric Research Unit Report*, 1969(Aug), No. 68-22, 30 p. Examines the singular lack of research data on defining the sleep requirements of man-in-the-sea. If man exhibited little or no disturbances of sleep during his stay in unusual or hostile environments, such a lack of research interest would be understandable. Sleep disturbances and sleep loss are, however, an almost inevitable consequence of living in unfamiliar and hostile environments. Behaviorally, sleep loss and sleep disturbances produce lapses in performance and impairment of short-term memory, either of which may endanger the mission or the life of the entire crew of an ocean floor habitat. Interpersonal difficulties may also arise as a result of undesirable personality changes caused by sleep disturbances. Research efforts should examine (a) whether man as an aquanaut may develop new kinds of sleep requirements which differ from those of land-based man, (b) whether man may also develop serious sleep disturbances during his attempts to adapt to the ocean floor environment, and (c) whether we can specify the optimal physical and psychological conditions for man's recuperation from fatigue by adequate sleep in the underwater habitat. 1E-K111F:1, a nitrogen saturation diving experiment illustrates an attempt to obtain the data necessary to define sleep requirements of man-in-the-sea. (59 ref.)—*Journal abstract*.

3178 Stang, Paul R., & Wiener, Earl L. (US Navy Deep Submergence Systems Project, Chevy Chase, Md.) **Diver performance in cold water.** *Human Factors*, 1970(Aug), Vol. 12(4), 391-399—12 experienced divers repeatedly performed several representative underwater work tasks for 90-min sessions at water temperatures of 50°, 60°, and 70° F. Time to complete the task was the primary performance measure, choice RT, with mental arithmetic as loading task, and 4 physiological measurements were also recorded. SA worked in 6', 11' of water wearing full 3 lb-in-thick wet suits and scuba equipment. Performance on all tasks except mental arithmetic tended to decrease as water temperature decreased. Most performance measures also showed a significant decrement over time and a significant Time x Temperature interaction. The general trend in performance measures was also reflected in several of the physiological measurements. (31 ref.)—*Journal abstract*.

ADVERTISING & CONSUMER PSYCHOLOGY

3179 Bauer, Raymond A., & Cunningham, Scott M. **The Negro market.** *Journal of Advertising Research*, 1970(Apr), Vol. 10(2), 3-13—Presents an overview including (a) basic data on Negro status in the 1960s, (b) development of interest in the Negro market, (c) the general pattern of Negro spending, and (d) circumstances offsetting when, where, how, and what Negroes buy. (27 ref.)—J. C. Franklin.

3180 Berger, Philip K., Fralry, George W., & Tarpey, St. Lawrence. (U. Kentucky) **The effect of advertising on the use of a train's diner.** *Journal of Advertising Research*, 1969(Dec), Vol. 9(4), 25-29—Placement of

menu cards in passenger railroad cars significantly increased the number of passengers using the diner. However, "the data did not support the expected relationship between menu placement, passenger weight and use of the diner."—J. C. Franklin

3181 Cagley, James W. & Cardozo, Richard S. **White response to integrated advertising.** *Journal of Advertising Research*, 1970(Apr) Vol. 10(2) 35-39—Reactions of high and low prejudiced college seniors were obtained to the same 3 ads with illustrations using whites and Negroes (integrated), whites only, and Negroes only. Results of analysis "imply that an advertiser who uses integrated advertising may incur an unfavorable reaction from more highly prejudiced consumers, but is unlikely to obtain an offsetting reaction from 'white liberal' consumers. There is no evidence... less prejudiced. So rate ads which pictured Negroes more favorably than those which pictured only whites." Moreover, the "less prejudiced... evaluated integrated and Negro ads about the same as white ads."—J. C. Franklin

3182 Cox, Keith K. **Social effects of integrated advertising.** *Journal of Advertising Research*, 1970(Apr) Vol. 10(2) 41-44—The same 5 mass magazines in 1967-1968 had 2% of all ads integrated as compared with 1% of 1% in 1949-1950. And, "whereas Negroes were predominantly stereotyped as lower skilled laborers in 1949-50 this rarely exists in 1967-68."—J. C. Franklin

3183 Frank, Ronald F., Mow, William P., & Lendell, Thomas M. (Pennsylvania) **Purchasing behavior and personal attributes.** *Journal of Advertising Research*, 1969(Dec) Vol. 9(4) 15-24—2,018(19) purchase transactions for beer, coffee, and tea combined from monthly diaries of about 5000 households were analyzed according to household socioeconomic and personality information. "The degree of association between socio-economic, demographic and personality variables with household purchasing is extremely modest. In addition, the incremental contribution of personality variables to prediction of knowledge of socio-economic and demographic characteristics is extremely small."—J. C. Franklin

3184 Hama, B. Curtis; Perry, Michael, & Wynn, Hugh F. (Oklahoma State U.) **The effect of a free sample on image and attitude.** *Journal of Advertising Research*, 1969(Dec) Vol. 9(4) 35-37—In a field study using hair spray, results show that exposure to a free sample changed the prior feminine image of the product among men and significantly increased their reported intentions to buy the product.—J. C. Franklin

3185 Leavitt, Clark. (Leo Burnett Co., Chicago, Ill.) **A multidimensional set of rating scales for television commercials.** *Journal of Applied Psychology*, 1970(Oct) Vol. 54(5) 427-429—1 set attribute ratings and factor analysis as a method of multidimensional scaling to determine on what dimensions viewers can rate TV commercials. An initial pool of 525 words was reduced to a final set of 45 words by a series of steps designed to eliminate words that (a) do not spontaneously use, (b) do not discriminate among commercials, and (c) do not represent a basic dimension emerging from a factor analysis. The final analysis resulted in 7 factors. The 3 main ones were overall level of energy or stimulation, personal relevance, and familiarity. 4 other factors also emerged at a lower level of explanatory power: sensual, novel, authoritative, and disliked. Results are surprising in that there is no positive evaluative factor. It is

suggested that positive evaluation is expressed in more specific ways.—Journal abstract

3186 Shimp, Terence A., Dunneally, James H., & Ivancovich, John M. (Maryland) **Study of consumer political orientations and store patronage.** *Journal of Applied Psychology*, 1970(Oct) Vol. 54(5) 430-432—A myriad of factors have been discussed and researched in analyzing the attitudes of customers toward a particular store and patronage of the institution. It is suggested that the political orientation of consumers should be considered when image and patronage decisions are being researched. 100 consumers completed the McClosky Conservative-Liberal scale and it was found that the political orientations of the participants and patronage of stores were significantly related.—Journal abstract

3187 Stafford, James E., Birdwell, Al, & Von Lintel, Charles E. **Integrated advertising—white backlash?** *Journal of Advertising Research*, 1970(Apr) Vol. 10(2) 15-20—Results of an experimental study measuring verbal and eye camera pupillary responses to each of 2 ads using racially integrated and all white models were largely inconclusive since product, individual differences, and creative aspects of the ads were operative extraracial variables.—J. C. Franklin

ENGINEERING PSYCHOLOGY

3188 Benjamin, Peter (Bellcomm, Inc., Washington, D.C.) **A hierarchical model of a helicopter pilot.** *Human Factors*, 1970(Aug) Vol. 12(4) 361-374—Develops and mechanizes a hierarchical model of a helicopter pilot by means of computer simulation. The basic element is a decision hierarchy which determines the multiple closure and tracking characteristics of the man-vehicle system. Pilot model input is quantized and used by the hierarchy to determine the specific loop to be closed and the particular transfer function to apply to that loop. The pilot model and vehicle dynamics are implemented on a digital computer. Model validation is provided by comparison of tracking records obtained from this simulation of the vehicle with a human operator. Although developed for a vehicle with only the 2 lateral degrees of freedom, the pilot model may be extended to 6 degrees of freedom. As a 4th-order system, it is applicable to the control of all vertical take off and landing maneuvers. The restriction of higher-order inputs to 0 permits application to vehicles with lower-order dynamics. Its form is independent of the input function. (28 ref.)—Journal abstract

3189 Burger, G. C. (Amsterdam, Coronel Lab. of Occupational Hygiene, Netherlands) **Heart rate and the concept of circulatory load.** *Ergonomics*, 1970(Nov) Vol. 13(11) 1571-1584—Discusses the functional demands of different types of work load. The need for absolute and comparative or relative measurement of estimation of these functional physiological demands in different work situations are considered. The validity of oxygen consumption of the body and of heart rate as an integrative ergonomics measure are critically discussed. It is pointed out that these measures have only a high validity when dynamic muscular work is considered. However, in muscular work of a static type and in the other types of work load there are many restrictions on their validity. Therefore, the concept of circulatory load is presented and its value as an ergonomics measure is discussed. The use of heart rate alone as a measure of circulatory load has a rather restricted value. It is shown that the intrinsic value of each heart beat as a measure of

circulatory load differs greatly in different types of work-load, since apart from heart rate stroke-volume and mean blood pressure show various patterns of reaction in these conditions. The possibilities of exact measurement in the practical work situation, are rather limited. Nevertheless, when using heart rate as an ergonomics measure, these additional quantitative data determining the circulatory load and their reactions on different types of work-load should be carefully estimated and taken into account. (German & French summaries) (21 ref.)—*Journal abstract*.

3190. Lewin T. (U. Göteborg, Inst. of Anatomy, Sweden) **Anthropometric studies on Swedish industrial workers when standing and sitting.** *Ergonomics*, 1969(Nov), Vol. 12(6), 883-902.—Studied anthropometry of standing and sitting positions for men and women aged 25-49 yr. selected at random from a major industry. Important ergonomics body dimensions were investigated. The means and standard deviations are presented for these measurements and correlation coefficients and regression equations for their relationships. The biological implications of differences demonstrated between different body measurements are considered. An important observation is that details within the working space should be correctly adjusted to the individual unless they disturb an already correct ergonomic design. (German & French summaries)—*Journal abstract*.

3191. Tarrière, C. & Rebliffé, R. **Etude d'une épreuve d'effort sur ergomètre adaptée aux conditions réelles de travail rencontrées en atelier.** [Study of an ergonomic fatigue test adapted to the actual work conditions found in a workshop.]—Investigated the different elements of fatigue in workers by means of trials on a bicycle ergometer capable of being used in a workshop which did not involve extra fatigue and could be used without too great an interruption in the work pattern. 10 Ss were used and compared on 5 tests of increasing difficulty. The test was found to be useful in a workshop and to be capable of evaluating the physical capacity of Ss with cardiac disorders. (German summary)—*English summary*.

Displays & Controls

3192. Huddleston, Jo H. (Royal Air Force Inst. of Aviation Medicine, Farnborough, England) **Tracking performance on a visual display apparently vibrating at one to ten Hertz.** *Journal of Applied Psychology*, 1970(Oct), Vol. 54(5), 401-408.—20 20-34 yr. old males performed compensatory 2-dimensional tracking on a visual display. This was viewed through a periscope, the lower mirror of which was oscillated about an axis so as to impose apparent vertical vibration on the display. The vibration frequency range 1-10 Hz. was explored, at (double) amplitudes of 2 and 4°. The decrement due to apparent vibration was frequency dependent, being greatest at those frequencies (3-5 Hz.) where a change-over in viewing technique was taking place. Over this range, progressively, reflexive eye pursuit is abolished and a virtual image at the limit of vibration excursion becomes usable. Data from eye movement studies on an additional group of 6 Ss corroborate this. (27 ref.)—*Journal abstract*.

3193. Rebliffé, R., Zayana, O., & Tarrière, C. **Détermination des zones optimales pour l'emplacement des commandes manuelles dans l'espace de travail.** [Determination of optimal zones for the site of manual

commands in the work space.] *Ergonomics*, 1969(Nov), Vol. 12(6), 913-924.—Presents a method of study of the dimensional arrangement of a work-place, in which the dimensional requirements are presented in a synthetic form. The boundaries of the maximum reach inside which controls should be located are determined. A volume of comfort is then defined, which is the geometrical locus of the hand positions, when the articulation angles are included inside predetermined limits. These data are integrated to present a work map. Each plane gives the maximum reach, comfort and effort zones. The common zones for tall and small Ss are defined; the influence of seat adjustment is shown. Each point of these zones is located in a system of coordinates centered on the shoulder or on the seat. (German summary) (16 ref.)—*English summary*.

3194. Stave, A.M. (Sikorsky Aircraft, Stratford, Conn.) **Criteria for the design of helicopter collective controls.** *Human Factors*, 1970(Aug), Vol. 12(4), 387-390.—Independent judgments by 7 engineers indicate that the angle at which a man's thumb rests most comfortably when operating a helicopter collective control is represented by a plane extending from the end of the collective. This comfort plane is tilted downward at an angle of 28° and rotated toward the pilot at an angle of 21°. For convenient operation all switches should be placed so that their upper surface lies on or near the surface of the comfort plane. A mock-up was built and received a positive evaluation by test pilots.—*Journal abstract*.

3195. Stowell, Harry R., Florip, David J., & Bauer, Robert W. **FP-50 flight display effects on vision.** *U.S. Army Human Engineering Laboratories Technical Note*, 1970(Mar), No. 2-70, 20 p.—It was hypothesized that the FP-50 display lighting in the cockpit would affect the pilot's outside visual performance during night flight. Both photometric measures and human factors experiments on the FP-50 with 12 pilots are summarized. Results indicate that the white light of the display had negligible effects on dark adaptation and visual acuity when operated at suitable low-level brightness for night flight. It was discovered, however, filters enhanced contrast of the display by 3 or 4 times at these low luminances.—*Journal abstract*.

DRIVING & SAFETY

3196. Currie, L. (Medical Research Council, London, England) **The perception of danger in a simulated driving task.** *Ergonomics*, 1969(Nov), Vol. 12(6), 841-849.—Investigates the relation between the perception of danger and avoidance of accidents. A method of simulating danger is described; and the relation between simple RT and perception of danger in the task is examined. No connection was found between simple RT and the accident records of the Ss or the nature of the task performed. A relation was found between accident records and the perception of danger. (German & French summaries)—*Journal abstract*.

3197. Mathieu, M. **Préables à une compréhension psychologique de l'accident aérien.** [Beginnings of a psychological understanding of the airplane accident.] *Information Psychologique*, 1969(Jan), No. 33, 23-44.—Accidents in the air may be due to inadequate training, lack of aptitude, accident proneness, fatigue, etc. A theory of inadaptation is proposed. (47 ref.)—S. G. Vandenberg.

Brief Subject Index

This index supplements the classification of abstracts given in the Table of Contents, and is designed to lead the reader to subjects that are more specific than the general categories of the classification. When many abstract numbers are listed under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

Climate (SEE Environment, Temperature)
Clinic (see also Community Services, Hospital, Treatment/Outpatient)
 2457, 2573, 2641, 2686, 2906
Clinical Judgment (see also Psychodiagnostics)
 2441, 2578, 2618, 2620, 2635, 2811
Clinical Psychology
 1453, 1456, 2425, 2426, 2428, 2430, 2439
Cluster Analysis (SEE Factor Analysis, Statistics)
Coalition Formation (SEE Group/Small)
Cochlea (SEE Ear)
Coding (SEE Categorical Behavior, Problem Solving, Display)
Cognition (see also Thinking, Categorical Behavior)
 1439, 1566, 2049, 2127, 2140, 2144, 2160, 2191, 2262, 2320, 2335, 2704, 2954, 2969, 2996, 3031, 3093
Cognitive Dissonance (SEE Attitude Change, Dissonance)
Cognitive Style
 1687, 2218, 2254, 2258, 2381, 2406, 3100
Coitus (SEE Sexual Behavior, Sexual Behavior-Animal)
Cold (SEE Temperature)
College (see also Education, School, Student/College)
 2251, 2260, 2914, 2925, 3016, 3024, 3060, 3078, 3083, 3168
College Counseling (SEE Counseling, Guidance Educational, Guidance/Vocational)
College Student (SEE Student/College)
College Success (SEE Achievement/Academic-College)
Color (see also Color Vision)
 1553, 1567, 1577, 1582, 1588, 1589, 1648, 1707, 1725, 1934, 2183, 2724
Color Vision
 1567, 1587, 1589, 1780, 1833, 2182, 2816, 3045

BRIEF SUBJECT INDEX

- Communication** (see also Communication/Nonverbal, Information, Language, Speech, Verbal Behavior)
1465, 2109, 2210, 2221, 2249, 2270, 2272, 2273, 2305, 2309, 2314, 2315, 2321, 2336, 2337, 2338, 2341, 2347, 2355, 2438, 2477, 2487, 2505, 2646, 2649, 2744, 2870, 3017, 3027, 3094, 3142, 3143, 3156
- Communication/Animal** (SEE Communication, Vocalization)
- Communication/Mass** (see also Television, Advertising)
2109, 2337, 2339
- Communication/Nonverbal**
2315, 2322, 2327, 2365, 2505, 3027
- Community** (see also Culture, Group)
2223, 2452, 2572, 2578, 2862, 2905, 3080, 3084, 3149
- Community Services** (see also Clinic, Mental Health)
2445, 2457, 2459, 2508, 2573, 2646, 2656, 2901, 2902, 2903, 2904, 2905, 2906, 2907
- Comparative Psychology** (see also Animal Psychology)
1908, 1961, 2029, 2030, 2031
- Competition** (see also Conflict, Cooperation, Motivation)
1524, 2304, 2325, 2383, 2968
- Complexity** (see also Cognitive Style, Stimulus)
2167, 2381
- Comprehension** (see also Thinking, Reading)
2340, 2355, 3035, 3049, 3073, 3114
- Compulsion** (SEE Obsession-Compulsion)
- Computer**
1440, 1461, 1470, 1489, 1491, 1492, 1493, 1494, 1495, 1496, 1497, 1502, 1582, 1785, 1885, 2285, 2343, 2623, 3113, 3147, 3152, 3157, 3174, 3188
- Concentration Camp** (SEE Prison, War)
- Concept** (see also Childhood/Concepts & Problem Solving in, Concept Formation, Thinking)
1436, 1500, 1721, 1746, 1748, 2045, 2241, 2338, 2704
- Concept Formation** (see also Childhood/Concepts & Problem Solving in)
1747, 1749, 2726
- Conditioned Emotional Response**
- Conditioned Galvanic Skin Response** (SEE Galvanic Skin Response)
- Conditioned Reflex** (SEE Conditioned Response, Reflex)
- Conditioned Response**
1517, 1674, 1821, 1883, 1896, 1898, 1911, 1946, 2009, 2059, 2060, 2064, 2070, 2087, 2089, 2640, 1425, 1434, 1443, 1615, 1617, 1632, 1635, 1767, 2605, 2709
- Conditioning** (see also next headings)
1673, 1681, 1963, 2058, 2061, 2063, 2089, 2393, 2533, 2640, 2822
- Conditioning/Avoidance** (SEE Learning/Avoidance, Rat/Avoidance & Avoidance Learning in)
- Conditioning/Classical**
1656, 1668, 1679, 1682, 1851, 2047, 2057
- Conditioning/Escape** (SEE Escape)
- Conditioning/Eyefix**
1680
- Conditioning/Interceptive**
1880
- Conditioning/Operant** (see also Rat/Conditioning in)
1519, 1532, 1678, 1681, 1683, 1880, 1967, 1989, 2044, 2048, 2054, 2066, 2075, 2080, 2088, 2257, 2396, 2523, 2527, 2668, 2815, 2870, 2881, 2962
- Conditioning/Verbal** (SEE Learning/Verbal)
- Conference** (SEE Symposium)
- Confidence Judgment** (SEE Certainty)
- Conflict** (see also Frustration, Learning/Avoidance, Interpersonal Processes)
1445, 1553, 1649, 1750, 1846, 2154, 2204, 2220, 2223, 2226, 2238, 2258, 2288, 2438, 2450, 2480, 2629, 2643, 2758, 2935
- Conformity** (see also Authoritarianism, Dominance, Expectation, Interpersonal Influence, Social Influence)
2313, 2316, 2663
- Congress** (SEE Symposium)
- Connotation** (SEE Meaning, Semantics)
- Conscience** (SEE Value & Values, Ethics, Motivation)
- Conscious States** (see also Awareness)
1884, 2227
- Conservation** (SEE Childhood/Concepts & Problem Solving in)
- Conservatism** (SEE Political Behavior, Personality Trait)
- Consonance** (SEE Dissonance)
- Constancy** (SEE Gestalt Psychology, Visual Perception, Perception)
- Consumer Behavior** (see also Advertising)
3179, 3183, 3184, 3186
- Contagion** (SEE Interpersonal Influence, Social Influence)
- Content** (SEE Information, Meaning)
- Context**
1695, 1707, 2149, 2168, 2256, 3035, 3114
- Contraception** (SEE Birth Control)
- Contribution & Criticism**
1478, 1578, 1596, 1679, 1713, 1723, 1752, 1894, 2137, 2182, 2256, 2336, 2529, 2940
- Control** (see also Display)
1555, 2078, 2694, 2738, 3193, 3194
- Control/Internal-External**
2218, 2239, 2323, 2377, 2380, 2799, 2805, 2997
- Convulsion** (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
- Cooperation**
2238, 2294, 2300, 2304, 2308, 2309, 2325, 2968
- Coordination** (SEE Motor Performance)
- Coping Behavior** (SEE Adjustment/Personal & Social)
- Copulatory Behavior** (SEE Sexual Behavior, Animal)
- Correlation** (see also Factor Analysis, Statistics)
1459, 1490, 2936, 3049, 3070
- Cortex** (SEE Cerebral Cortex, Visual Cortex)
- Counseling** (see also Guidance/Educational, Guidance/Vocational, Interview)
1445, 2416, 2431, 2444, 2497, 2672, 2675, 2719, 2800, 2801, 2802, 2803, 2804, 2805, 2806, 2809, 2906, 2984, 2996, 2997, 3000, 3001, 3002, 3004, 3007, 3010, 3064
- Counseling/College** (SEE Guidance/Educational, Guidance/Vocational)
- Counselor**
2443, 2447, 2450, 2800, 2804, 2999, 3006
- Countertransference** (SEE Interpersonal Processes, Psychotherapy, Psychoanalysis, Therapeutic Process)
- Counting** (SEE Mathematics, Number)
- Court** (SEE Law, Crime & Criminals)
- Courtship** (SEE Interpersonal Attraction)
- Creativity** (see also Aesthetics, Gifted, Literature, Music, Thinking)
2112, 2137, 2171, 2173, 2175, 2179, 2232, 2374, 2395, 2406, 3012, 3035, 3067, 3115, 3169, 3187
- Credibility** (SEE Experimentation & Experiments, Interpersonal Influence, Social Perception)
- Crime & Criminals** (see also Delinquency/Juvenile, Law, Prison)
1552, 2514, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2667, 2862
- Crisis & Crisis Intervention** (see also Community Services, Emotion)
2212, 2229, 2442, 2512, 2577, 2973
- Critical Flicker Fusion** (SEE Vision)
- Criticism** (SEE Contribution & Criticism)
- Cross-Cultural Differences** (see also Culture, Cultures & Countries)
2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2414, 2564, 2653, 2682, 2998, 3037, 3135
- Cue**
1558, 1586, 1686, 1707, 2148, 2178, 2221, 2315
- Cultural Anthropology** (SEE Culture)
- Cultural Disadvantage** (SEE Socioeconomic Status, Childhood/Disadvantaged)
- Culture** (see also Cultures & Countries, Ethnology, Social Influence)
1425, 1432, 1470, 2204, 2211, 2218, 2222, 2224, 2252, 2461, 2480, 2608, 2612, 2638, 2646, 2653, 2655, 2663, 2716, 3032, 3149, 3158
- Cultures & Countries** (see also Culture, Africa, Canada, France, Germany, Great Britain, India, Israel, Japan, Latin America, United States, USSR)
1456, 2130, 2232, 2233, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2252, 2262, 2283, 2348, 2378, 2414, 2433, 2476, 2682, 2686, 2836
- Curiosity** (SEE Motivation, Thinking)
- Curriculum** (see also School Administration, Mathematics, Reading)
2915, 2923, 2931, 2938, 2942, 2954, 3019, 3034, 3040, 3041, 3050, 3065, 3067, 3075, 3076, 3081, 3082, 3083, 3085, 3086, 3087, 3089, 3090, 3091, 3092, 3095, 3096, 3102, 3107, 3119, 3123
- Cutaneous Sense** (see also Skin)
1536, 1558, 1891, 1892, 2122, 2855, 2856, 2966
- Cybernetics** (SEE Communication, Feedback, Computer)
- Dark Adaptation** (SEE Adaptation/Sensory)
- Data Processing** (SEE Computer, Statistics)
- Day Dreaming** (SEE Fantasy)
- Deafness & Hearing Disorder**
2818, 2819, 2820, 2821, 2974, 2975, 2976, 3125
- Death** (see also Suicide)
1928, 2583, 2588, 2756
- Death Penalty** (SEE Law)
- Deception**
2186, 2193, 2384, 2659
- Decision Making** (see also Choice Behavior, Game, Learning/Probability)
1476, 1484, 1750, 1751, 1752, 1754, 2317, 2336, 2347, 2517, 3188
- Decoding** (SEE Categorical Behavior, Problem Solving, Display)
- Defecation** (SEE Elimination)
- Defense Mechanism** (see also Identification, Repression)
2125, 2230, 2231, 2368, 2419, 2468, 2481, 2513, 2585, 2595, 2604, 2613, 2636, 2814, 2933, 2982
- Defense/Perceptual** (SEE Defense Mechanism)
- Defensiveness** (SEE Defense Mechanism, Personality Trait)
- Deja Vu** (SEE Familiarity, Parapsychology)
- Delayed Reaction** (SEE Response)
- Delinquency/Juvenile** (see also Antisocial Behavior, Crime & Criminals)
2208, 2510, 2515, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675
- Delirium** (SEE Mental Disorder, Neurosis, Psychosis)
- Delusion** (SEE Mental Disorder, Neurosis, Psychosis)
- Demographic Variables** (SEE Population Characteristics)
- Denial** (SEE Defense Mechanism)
- Dependency**
1687, 1712, 2179, 2197, 2243, 2266, 2293, 2302, 2379, 2407, 2409, 2411, 2572, 2664, 2694, 2907, 2932, 3159
- Depression** (see also Emotion, Emotional Disturbance)
1935, 1958, 1984, 2379, 2422, 2550, 2555, 2556, 2558, 2566, 2569, 2571, 2627, 2633, 2651, 2683, 2685, 2693, 2694, 2703, 2708, 2710, 2742, 2752, 2756, 2760, 2785, 2811, 3072
- Deprivation** (see also Deprivation/Sensory, Food Deprivation, Isolation, Rat/Deprivation in)
1636, 1644, 1645, 1713, 1903, 2051

- Deprivation/Sensory
1612, 2782
- Depth Perception (SEE Perception/Depth)
- Desegregation (SEE Integration)
- Desensitization Therapy (SEE Behavior Therapy)
- Detection
1473, 1552, 1576, 1600, 1601, 1602, 2177
- Developing Countries (SEE Cultures & Countries)
- Development (see also Childhood/Development in, Language Development, Maturation)
2034, 2112, 2115, 2117, 2205, 2368, 2479, 2593, 2599, 2603, 2676, 3089
- Dexterity (SEE Hand, Motor Performance)
- Diabetes (SEE Blood, Disease)
- Diagnosis (see also Psychodiagnosis, Schizophrenia/Diagnosis of, Mental Retardation/Diagnosis of)
1520, 1528, 1808, 1994, 2000, 2169, 2456, 2562, 2616, 2617, 2762, 2763, 2827, 2829, 2833, 2834, 2835, 2839, 2840, 2843, 2845, 2851, 2909, 2986
- Diagnosis/Differential
2630, 2698, 2718, 2774, 2788, 2827, 2970
- Dial (SEE Display)
- Diet (SEE Food)
- Differential Reinforcement at Low Rates of Responding (SEE Reinforcement Schedule)
- Digestive System (see also Metabolism)
1811, 1819, 1899, 1965, 2010, 2024, 2729, 2754, 2900
- Digit (SEE Number)
- Disability (SEE Physical Handicap)
- Disarmament (SEE War, International Relations)
- Discrimination (see also Auditory Discrimination, Learning Discrimination, Visual Discrimination, Rat/Discrimination in)
1665, 1967, 2035, 2057, 2143, 2152, 2387, 2856
- Discrimination Learning (SEE Learning/Discrimination)
- Discrimination Reversal
1833
- Discrimination/Racial (SEE Integration, Prejudice, Social Movements)
- Disease (see also Illness)
1437, 1789, 1953, 2018, 2108, 2421, 2488, 2752, 2754, 2780, 2784, 2786, 2788, 2812, 2827, 2831, 2847, 2888, 2891, 2893, 2897, 2898, 2900
- Displacement (SEE Defense Mechanism)
- Display (see also Control)
3192, 3195
- Dissonance (see also Attitude Change)
2191, 2234, 2258, 2267, 2273, 2275, 2320
- Distance (SEE Perception/Depth)
- Distraction (SEE Attention)
- Diurnal Rhythms (SEE Biological Rhythms)
- Divorce (SEE Marital Problems)
- DNA (SEE Biochemistry)
- Dog
1532, 1819, 1821, 1895, 1911, 1928, 1944, 1979, 1983, 1993, 2058, 2060, 2061, 2063, 2087, 2106
- Dogmatism (SEE Authoritarianism, Personality Trait)
- Dominance (see also Authoritarianism)
2040, 2099, 2193, 2216
- Double Blind Design (SEE Experimental Design)
- Down's Syndrome (SEE Genetics, Mental Retardation)
- Draft (SEE Military)
- Draw-a-Man Test (SEE Projective Technique)
- Draw-A-Person Test (SEE Projective Technique)
- Drawing (see also Aesthetics, Creativity, Picture)
1733, 2112, 2181, 2333, 2347, 2723, 2794
- Dream & Dreaming (see also Rapid Eye Movement, Sleep)
1457, 1511, 1612, 1614, 1615, 1617, 1618, 1619, 1620, 1621, 1624, 1625, 1626, 1631, 1633, 1634, 1637, 1638, 1639, 1641, 1645, 1767, 1788, 1938, 2579, 2586, 2589, 2592, 2607, 2609, 2611, 2615, 2583, 2606
- Drinking (SEE Alcohol, Water & Water Intake)
- Drive (SEE Motivation)
- Driving (see also Safety)
2339, 3196
- DRL (SEE Reinforcement Schedule)
- Dropout (SEE School Dropout)
- Drug Addiction (see also Drug Effects, Drugs)
1917, 2596, 2621, 2641, 2784
- Drug Effects (SEE next headings, Drug Addiction)
- Drug Effects-Animal (see also Rat/Drug Effects in, Cat/Drug Effects in, Drugs)
1844, 1944, 1945, 1946, 1947, 1950, 1960, 1961, 1963, 1967, 1968, 1970, 1977, 1978, 1979, 1981, 1982, 1983, 1984, 1986, 1989, 1999
- Drug Effects-Human (see also Drug Addiction, Drugs)
1915, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 2440, 2556, 2564, 2764, 2857
- Drug Therapy
2465, 2482, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2761, 2830
- Drug Therapy-Schizophrenia
2549, 2550, 2564, 2747, 2749, 2750
- Drug Usage & Abuse (see also Drug Addiction, Drugs)
2368, 2369, 2370, 2674, 2690
- Drugs (see also Amphetamine, Antidepressant Drugs, Chlorpromazine, Lysergic Acid Diethylamide, Marijuana, Tranquilizer)
1941, 2652, 2776
- Dyad (SEE Group/Small, Interpersonal Processes)
- Dyslexia (SEE Reading Deficiency)
- Ear (see also Audition)
1600, 1604, 1769, 1912, 2105, 2737, 2824
- Eating (SEE Food, Food Intake)
- Ecology (SEE Environment)
- Education (see also next headings, College, Curriculum, School, Teaching, Training)
1425, 1447, 2228, 2337, 2419, 2681, 2912, 2913, 2915, 2919, 2925, 3019, 3042, 3080, 3089, 3095, 3148, 3149
- Education/Adult (SEE Education)
- Education/Physical
2172, 2871, 3082, 3092
- Education/Programs In
2993, 3057, 3077, 3078, 3079, 3080, 3081, 3083, 3084, 3088, 3093
- Education/Special
2184, 2619, 2961, 2962, 2964, 2965, 2969, 2976, 2977, 2978, 2979, 2980, 2986, 2990, 2993, 3093
- Education/Special-Mental Retardation (see also Mental Retardation/Learning in)
2865, 2985, 2991
- Education/Special-Remedial
2401, 2966, 2967, 2968, 2970, 2971, 2973
- Educational Background
2207, 2447, 2667, 2686, 2951, 3020, 3147
- Educational Guidance (SEE Guidance/Educational)
- Educational Measurement (see also Test/Achievement)
2914, 2938, 2940, 2941, 2946, 2949, 2952, 2954, 2955, 2957, 2959, 2960, 2965
- Educational Psychology
1456, 2912, 2920, 2921, 2931
- Edwards Personal Preference Schedule (SEE Test/Personality)
- Effort (SEE Work & Work Analysis)
- Ego (see also Self)
1431, 1433, 2136, 2273, 2465, 2580, 2585, 2602, 2606, 2612, 2613, 2636, 2671, 2719, 2814, 2981
- Electrical Activity (see also Potential/Evoked)
1493, 1525, 1531, 1538, 1541, 1543, 1544, 1548, 1551, 1625, 1626, 1632, 1650, 1652, 1763, 1795, 1798, 1815, 1820, 1826, 1844, 1845, 1853, 1855, 1856, 1857, 1859, 1860, 1861, 1862, 1864, 1866, 1868, 1870, 1871, 1872, 1873, 1894, 1897, 1901, 1902, 1914, 1935, 1939, 1945, 1947, 1956, 1958, 1959, 1991, 2003, 2007, 2009, 2059, 2645, 2855, 3107
- Electrocardiogram (SEE Electrophysiology, Cardiovascular Processes, Heart)
- Electroconvulsive Shock
- Electroconvulsive Shock Therapy
2482, 2627, 2657
- Electrode (SEE Electroencephalography, Electrical Activity)
- Electrodermal Response (SEE Galvanic Skin Response)
- Electroencephalography (see also Arousal)
1524, 1529, 1622, 1630, 1768, 1862, 1869, 1875, 1876, 1878, 1881, 1882, 1884, 1885, 1886, 1887, 1890, 1893, 1898, 1903, 1915, 1938, 2021, 2687, 2741, 2827, 2829, 2840, 2888
- Electroencephalography-Animal
1762, 1830, 1832, 1864, 1879, 1883, 1896, 1899, 1945, 1946, 1959, 1972, 1987, 1993, 2727
- Electromyography (see also Eye Movement, Muscle)
1513, 1524, 1529, 1551, 1844, 1858, 1864, 1896, 1898, 1939, 2107, 2121, 2788, 2828, 2831
- Electrophysiology
1508, 1514, 1515, 1518, 1522, 1524, 1525, 1529, 1531, 1535, 1538, 1543, 1544, 1548, 1550, 1813, 1858, 1865, 1867, 1868, 1870, 1906, 2004, 2831
- Electroretinography (SEE Electrophysiology, Retina)
- Elimination
1814, 1917, 1929, 2429, 2563, 2690, 2710, 2730, 2753, 2775, 2812, 2897
- Embedded Figures (SEE Test/Intelligence, Dependency)
- Embryo (see Pregnancy)
- Emotion (see also Affect, Depression)
1443, 1613, 1623, 1628, 1629, 1637, 1650, 1656, 1763, 1810, 1863, 2144, 2183, 2201, 2231, 2282, 2302, 2322, 2344, 2389, 2433, 2492, 2681, 2688, 2695, 2798, 2804, 2814, 2890, 3027
- Emotional Disturbance (see also Childhood/Emotional Disturbances in)
2463, 2513, 2556, 2558, 2569, 2571, 2621, 2665, 2685, 2698, 2699, 2701, 2707, 2755, 2759, 2899, 2961
- Emotionality (see also Emotion)
2399, 2852, 2997
- Empathy (see also Therapeutic Process)
2023, 2278, 2640
- Employee (SEE Personnel/Industrial)
- Encephalitis (SEE Brain Disorder)
- Encoding (SEE Categorical Behavior, Memory, Thinking)
- Encounter Group (SEE Sensitivity, Psychotherapy/Group)
- Endocrine (SEE Gland, Hormone)
- Endogenous-Exogenous Factor (SEE Etiology)
- Engineering Psychology
1463, 1473, 1765, 2307, 3176, 3189, 3190, 3191, 3193
- Engineers & Engineering (SEE Occupation)
- Enuresis (SEE Elimination)
- Environment (see also Environment-Animal, Isolation, Temperature, Deprivation/Sensory, Urban & Suburban Environment, Rural Environment)
1439, 1558, 1862, 2013, 2018, 2108, 2140, 2212, 2307, 2400, 2706, 2842, 2914, 3172, 3175, 3177, 3178
- Environment-Animal (see also Isolation, Deprivation/Sensory, Temperature)
1837, 1924, 1970, 2033, 2038, 2040, 2074, 2104
- Epilepsy
2553, 2554, 2559, 2792, 2796, 2855, 2856, 2857

BRIEF SUBJECT INDEX

- Epinephrine**
1795, 1960, 2753
- EPPS (SEE Test/Personality)**
- Equipment (SEE Apparatus, Apparatus-Animal)**
- Ergonomics (SEE Engineering Psychology, Industrial Psychology)**
- Error**
1479, 1503, 1517, 1590, 1748, 2352
- Escape**
1683, 2071, 2072, 3175
- Esthetics (SEE Aesthetics)**
- Estimation**
1481, 1750, 2114
- Ethics (see also Value & Values, Philosophy)**
1452, 2452, 2456
- Ethnology**
2136, 2140, 2146, 2183, 2221, 2222, 2234, 2262, 2287, 2363, 2522, 2564, 2667, 2813, 2941, 3048, 3069, 3117, 3148
- Etiology**
1789, 2558, 2562, 2642, 2648, 2677, 2701, 2707, 2711, 2718, 2720, 2838, 2847, 2853, 2873, 2889, 2900
- Eugenics (SEE Genetics)**
- Evaluation (see also Work & Work Analysis)**
1765, 2333, 2366
- Evoked Potential (SEE Potential/Evoked)**
- Evolution (SEE Comparative Psychology, Science, Theory)**
- Examination (SEE Educational Measurement, Test/Achievement, Test & Testing)**
- Exceptional Child (SEE Education/Special, Education/Special-Remedial, Education/Special-Mental Retardation, Gifted, Childhood/Handicapped)**
- Excitation (SEE Inhibition, Potential/Evoked, Stimulation)**
- Excretion (SEE Elimination)**
- Executive (SEE Management)**
- Exercise (SEE Work)**
- Exhibitionism (SEE Sexual Deviation)**
- Existential Psychology & Psychiatry (SEE Existentialism)**
- Existentialism**
1432, 2485
- Expectation & Expectancy (see also Aspiration, Set)**
1651, 1657, 1696, 2133, 2194, 2289, 2380, 2399, 2496, 2695, 2805, 3017
- Experience (see also Familiarity, Practice)**
2443, 2813, 3026
- Experience/Early**
1923, 1924, 1957, 2034, 2035, 2036
- Experimental Design**
1458, 2213
- Experimental Psychology**
1496, 1554, 1555, 2347
- Experimentation & Experiments (see also Research, Research Methods)**
1459, 1466, 1471, 1475, 1495, 1508, 1511, 1631, 1639, 1661, 2002, 2215, 2281, 2397, 2423
- Experimenter Bias (SEE Bias, Experimentation & Experiments)**
- Expert Testimony (SEE Law, Clinical Judgment)**
- Exploratory Behavior (see also Rat/Activity in)**
2042
- Extinction (see also Extinction/Resistance to, Inhibition, Learning, Rat/Extinction in)**
1667, 1670, 1683, 1714, 2048, 2064, 2079, 2087, 2532
- Extinction/Resistance to**
1672, 2065
- Extrasensory Perception (SEE Parapsychology)**
- Extraversion-Introversion**
2022, 2237, 2396, 2418, 2659, 2722, 2997, 3003
- Eye (see also Retina, Vision)**
1554, 1568, 1585, 1769, 1781, 1797, 1808, 1881, 1886, 1905, 1906, 1907, 1910, 1913, 1914, 1977
- Eye Movement (see also Rapid Eye Movement)**
- 1571, 1573, 3187, 3192
- Eye/Conditioning (SEE Conditioning/Eyelid)**
- Facial Expression (SEE Communication/Non-verbal, Social Perception)**
- Factor Analysis (see also Correlation)**
1474, 1486, 1487, 1491, 1498, 1506, 2179, 2187, 2375, 2407, 2567, 2806, 2936, 2945, 2947, 2948, 2950, 2955, 2960, 3024, 3025, 3185
- Faculty (SEE Teacher)**
- Failure (SEE Achievement, Emotion, Anxiety)**
- Faking (SEE Deception)**
- Familiarity (see also Experience, Practice)**
1444, 1652, 1666, 1693, 1710, 1827, 1837, 1924, 2035, 2040, 2044, 2119, 2120, 2126, 2321, 2339, 2406, 2561
- Family (see also next headings, Marriage, Mother, Father)**
2110, 2208, 2218, 2244, 2245, 2246, 2247, 2283, 2433, 2442, 2676, 2683, 2778, 2812, 2884, 2901, 2990, 3006
- Family Planning (SEE Birth Control)**
- Family Relations (see also Parent-Child Relations)**
2197, 2198, 2201, 2518, 2674, 2696, 2700, 2705, 2731, 2808
- Family Therapy**
2508, 2512, 2518, 2520, 2810
- Fantasy (see also Dream & Dreaming, Imagery)**
1647, 2500, 2590, 2605
- Farming (SEE Rural Environment, Occupation)**
- Father (see also Parent-Child Relations)**
2196, 2197, 2198, 2199, 2200, 2390, 2590, 2671, 2876, 2999, 3006
- Fatigue**
1560, 1775, 3151, 3191
- Fear (see also Anxiety, Emotion, Motivation, Phobia, Threat)**
2041, 2279, 2530, 2531, 2535, 2547, 2695, 2756
- Feeble-mindedness (SEE Mental Retardation)**
- Feedback (see also Reinforcement)**
1511, 1676, 1681, 1694, 1696, 1697, 1698, 1703, 1723, 1748, 1750, 1863, 2061, 2167, 2275, 3111
- Feeding (SEE Food Intake)**
- Feeling (SEE Emotion)**
- Femininity (SEE Sex Role)**
- Fetishism (SEE Sexual Deviation, Sexual Disorder)**
- Fetus (SEE Pregnancy)**
- Field Dependence (SEE Dependency)**
- Field Study (SEE Research Methods, Observation)**
- Fighting (SEE Aggression, Hostility)**
- Figural Aftereffect (SEE Aftereffect)**
- Figure (SEE Stimulus, Pattern, Perception/Form & Shape)**
- Film**
1492, 1650, 1652, 1657, 3107, 3112, 3115, 3116
- Fine Arts (SEE Aesthetics, Literature, Music)**
- Finger (SEE Hand, Motor Performance, Body)**
- Fish**
1963, 2014, 2028, 2037, 2047, 2073, 2075, 2091, 2098, 2103
- Flavor (SEE Taste)**
- Flicker Fusion (SEE Vision)**
- Fond**
2034, 2108, 2867, 3180
- Fond Deprivation**
2042
- Fond Intake**
1532, 1828, 1847, 1916, 1921, 2024, 2058, 2115, 2124, 2463, 2526, 2698, 2701, 2707, 2750
- Food Preference (SEE Food Intake)**
- Forced Choice (SEE Choice Behavior, Item, Response, Testing Methods)**
- Foreign Relations (SEE International Relations)**
- Foreman (SEE Management)**
- Forgetting (SEE Extinction, Learning, Memory, Retention)**
- Form Perception (SEE Perception/Form & Shape)**
- Foster Home (SEE Family, Community Services)**
- France**
- Freud/S. (SEE Psychoanalysis, Psychoanalytic Theory)**
- Friendship (SEE Interpersonal Processes, Interpersonal Attraction)**
- Frigidity (SEE Sexual Disorder)**
- Frog**
1795, 1899, 2040
- Frontal Lobotomy (SEE Brain Lesion, Brain Lesion-Animal)**
- Frustration (see also Aggression, Conflict, Emotion)**
1848, 2053, 2131, 2591
- Galvanic Skin Response**
1529, 1552, 1603, 1649, 1702, 1862, 1863, 1868, 1869, 2023, 2327, 2640
- Game (see also Recreation)**
1752, 1753, 2135, 2294, 2300, 2304, 2308, 2309, 2336, 2802
- Game Theory (SEE Choice Behavior, Decision Making, Learning/Probability)**
- Gastrointestinal Processes (SEE Digestive System)**
- Generalization**
1684, 1851, 2057, 2068, 2078, 2143, 2190, 2964
- Generalization/Stimulus (SEE Transfer, Generalization)**
- Genetics**
1439, 1440, 1634, 1803, 2016, 2017, 2018, 2019, 2020, 2141, 2400, 2683, 2721, 2725, 2761, 2775, 2777, 2828, 2841, 2847, 2860, 2866, 2867, 2868, 2873
- Genetics-Animal**
1930, 1965, 1982, 2014, 2015, 2016, 2030, 2069
- Genius (SEE Gifted)**
- Geriatrics (see also Gerontology)**
2635, 2908, 2909, 2910, 2911
- Germany**
2259, 2261, 2912
- Gerontology (see also Geriatrics)**
2111, 2210, 2316, 2612
- Gestalt Psychology**
- Gifted**
2965
- Gland (see also Epinephrine, Hormone)**
1778, 1815, 1818, 1924, 1925, 1926, 1928, 1931, 1964, 2043, 2710, 2860, 2895
- Goal (SEE Motivation)**
- Goodenough Test (SEE Projective Technique)**
- Government**
1446, 1485, 2211, 2276, 3159, 3160
- Grades & Grade-Point Average (SEE Achievement/Academic, Achievement/Academic-College, Achievement/Academic-Elementary School)**
- Grammar**
1444, 2161, 2162, 2163, 2346, 2349, 2350, 2352, 2359, 2427, 3120
- Graphology (SEE Writing)**
- Great Britain**
2237, 2238
- Group (see also next headings, Community, Culture, Interpersonal Processes)**
1754, 2223, 2271, 2283, 2288, 2305, 2306, 2613, 2649, 2802, 2996, 3001, 3007, 3154
- Group Discussion**
2288, 2317
- Group Dynamics**
2233, 2289, 2296, 2305, 2306, 2517, 3144
- Group Influence (SEE Social Influence)**
- Group Structure (SEE Group, Role)**
- Group Therapy (SEE Psychotherapy/Group)**
- Group/Ethnic (SEE Ethnology)**
- Group/Small (see also Interpersonal Processes)**

- esses)
 2192, 2233, 2286, 2301, 2521, 3093
Guidance (SEE next headings, Counseling)
Guidance/Child (SEE Psychotherapy/Children, Guidance/Educational)
Guidance/Educational
 2444, 2950
Guidance/Vocational
 2805, 2994, 3003, 3005, 3006, 3008, 3009, 3131, 3132
Guilt (SEE Emotion, Motivation)
Guinea Pig (SEE Animals)
Gustation (SEE Taste)
- Habit** (SEE Learning, Extinction)
Habituation
 1630, 1988, 2046, 2075, 2098, 2105, 2121
Hallucination
 1648, 2751
Hallucinogen (SEE Drugs, Lysergic Acid Diethylamide)
Halo Effect (SEE Rating Scale)
Hand (see also Body, Motor Performance)
 1604, 1769, 2976
Handedness (SEE Laterality)
Handicap (SEE Childhood/Handicapped, Physical Handicap, Blindness, Deafness & Hearing Disorder)
Handling (see also Experience/Early)
 1924
Handwriting (SEE Writing)
Headache (SEE Illness)
Hearing (SEE Audition)
Hearing Loss (SEE Audition, Deafness & Hearing Disorder)
Hearing/Hard of (SEE Deafness & Hearing Disorder)
Heart (see also Blood, Blood-Animal, Blood Pressure, Cardiovascular Processes, Heart Rate)
 1518, 1960, 1966, 1969, 1994, 2000, 2003, 2557
Heart Rate
 1651, 1681, 1682, 1768, 1839, 1969, 2023, 2060, 2133, 2390, 2392, 2531, 2541, 2645, 2693, 2694, 3189
Heat (SEE Temperature)
Height (SEE Physique)
Helping Behavior (SEE Interpersonal Processes)
Heredity (SEE Genetics)
High School (SEE School, Student/High School, Adolescence)
Higher Education (SEE College)
Hippocampus
 1762, 1837, 1839, 1947, 2783
History (see also Psychology/History of)
 2019, 2135, 2252, 2342, 2360, 2919, 2920, 3021
Hoarding (SEE Instinctive Behavior)
Homicide (SEE Crime & Criminals, Suicide)
Homosexuality
 2253, 2676, 2678, 2679
Honesty (SEE Deception)
Hormone (see also Epinephrine)
 1778, 1794, 1818, 1843, 1916, 1920, 1921, 1923, 1924, 1925, 1926, 1927, 1928, 1930, 1931, 1932, 1933, 1964, 2100, 2557, 2562, 2563, 2710, 2753, 2760, 2785, 2830, 2860
Hospital & Hospitalization (see also Clinic, Institution & Institutionalization, Mental Hospital & Hospitalization)
 2421, 2499, 2573, 2641
Hostility (see also Aggression)
 2350, 2568, 2587, 2693, 2706, 2754
Hue (SEE Color)
Human Engineering (SEE Engineering Psychology)
Humor (see also Literature, Language, Emotion)
 2372
Hunger (SEE Food Deprivation, Motivation)
Husband (SEE Marriage)
Hypnosis
 1646, 1647, 1648, 1649, 2467, 2545
- Hypnotherapy** (SEE Hypnosis, Psychotherapy/Methods in)
Hypothalamus
 1682, 1806, 1815, 1838, 1840, 1846, 1847, 1848, 1849, 1852, 1889, 1915, 1947, 1984
Hysteria & Hysterics (see also Mental Disorder, Neurosis, Psychosis)
 2626, 2711
- Id** (SEE Psychoanalytic Theory)
Identification
 1676, 2161, 2193, 2215, 2398, 2474, 2572, 2671, 2814, 2965, 3160
Identity
 2209, 2252, 2585, 2612, 2713
Illegitimate Pregnancy (SEE Pregnancy, Mother)
Illness (see also Disease)
 2456, 2466, 2753, 2769, 2775, 2889, 2890, 2892, 2894, 2895, 2897, 3138
Illumination (SEE Brightness, Environment)
Illusion
 1562, 1563
Image (see also Self-Perception, Social Perception, Body)
 1582, 1733, 2614, 3184
Imagery
 1560, 1691, 2322, 2402
Imagination (SEE Fantasy, Cognition, Thinking)
Imitation (see also Instinctive Behavior, Interpersonal Processes, Model)
 2143, 2193
Impression Formation (SEE Social Perception)
Imprinting (SEE Instinctive Behavior, Experience/Early)
Incentive (see also Motivation, Reward, Reinforcement)
 2076, 2134, 2267, 2883
Incest (SEE Sexual Deviation)
Incidental Learning (SEE Learning)
Income (SEE Money, Socioeconomic Status)
Independency (SEE Dependency)
Infants
 2224, 2240, 3022, 3076
Indian/American (SEE Ethnology)
Individual Differences
 1601, 1642, 1645, 1744, 2315, 2346, 2375, 2419, 2734, 2796, 3187
Industrial Psychology (see also Business, Personnel/Industrial)
 1456, 3128, 3152
Industry (SEE Business, Personnel/Industrial)
Infancy (see also Neonate)
 1882, 2036, 2108, 2119, 2120, 2123, 2124, 2125, 2126, 2130, 2866, 2867
Influence (SEE Interpersonal Influence, Persuasion, Social Influence)
Information (see also Communication, Information Theory, Language)
 1460, 1461, 1465, 1492, 1493, 1511, 1552, 1566, 1676, 1723, 1724, 1737, 1738, 1740, 1743, 1749, 1750, 1793, 1799, 1803, 2001, 2102, 2109, 2145, 2176, 2258, 2303, 2339, 2343, 2355, 2628, 2646, 2803, 2850, 2984, 3142
Information Retrieval (SEE Information, Computer)
Information Theory (see also Information)
 1440, 1674, 2354
Inheritance (SEE Genetics)
Inhibition (see also Extinction, Interference)
 1570, 1685, 1699, 1708, 1735, 1736, 1804, 1953, 1962, 2078, 2106
Inkblot (SEE Projective Technique, Rorschach Test)
Insect
 2025, 2038, 2043, 2096
Insecurity (SEE Dependency, Neurosis)
Insight (SEE Problem Solving, Thinking, Self-Perception, Social Perception, Therapeutic Process)
Instinctive Behavior (see also Sexual Behavior-Animal)
 2032, 2037, 2038, 2039, 2097, 2100, 2124, 2588
- Institute** (SEE Organizations, College)
Institution & Institutionalization (see also Hospital & Hospitalization, Mental Hospital & Hospitalization)
 2515, 2658, 2714, 2842, 2869, 2883, 2885
Instruction (see also Teaching)
 2343, 2916, 3114
Instructions/Experimental
 1575, 1672, 1681, 1691, 1741, 1747, 2256, 2387, 2949
Insulin (SEE Hormone)
Insulin Shock Therapy (SEE Therapy)
Integration
 2223, 2262, 2276, 2948, 3011, 3048, 3181, 3182, 3187
Intellectual Processes (SEE Cognition, Thinking)
Intelligence (see also next headings)
 2017, 2110, 2159, 2167, 2174, 2202, 2400, 2402, 2403, 2404, 2406, 2659, 2852, 3031, 3035, 3056, 3069, 3108, 3110
Intelligence Quotient
 1705, 2021, 2142, 2667, 2732, 2880, 2972, 3028, 3038
Intelligence Tests & Testing (SEE Test/Intelligence)
Intensity (SEE Stimulus Intensity, Shock & Shock Intensity)
Interest (see also Motivation)
 1447, 2201, 2382, 2924, 3057, 3091
Interest/Vocational (SEE Occupational Interest)
Interference
 1553, 1602, 1658, 1708, 1720, 1725, 1728, 1735, 1736, 1937, 2050
Internal-External Control (SEE Control/Internal-External)
International Relations
 2128, 2337
Interpersonal Attraction
 1652, 2281, 2285, 2291, 2293, 2299, 2302, 2310, 2318, 2324, 2326, 2328, 2329, 2330, 2411
Interpersonal Influence
 1652, 1661, 1663, 2113, 2272, 2280, 2318, 2705, 3006
Interpersonal Perception (SEE Social Perception)
Interpersonal Processes (see also Interpersonal Attraction, Interpersonal Influence, Group, Social Processes, Family Relations)
 1445, 1752, 2207, 2210, 2217, 2233, 2247, 2284, 2286, 2287, 2290, 2293, 2295, 2297, 2298, 2301, 2302, 2303, 2304, 2313, 2318, 2320, 2331, 2335, 2365, 2394, 2446, 2453, 2496, 2498, 2501, 2502, 2537, 2649, 2669, 2703, 2800, 2814, 2910, 2916, 2924, 2989, 2997, 3011, 3017, 3021, 3066, 3086, 3142, 3143, 3172, 3177
Interresponse Interval (SEE Interval/Time)
Intersensory Processes
 1558, 1559, 1599, 1604, 1611, 1664
Interval/Interstimulus
 1566, 1567, 1578, 1593, 1662, 1680, 1730, 1738, 1768, 1883, 2105, 2340, 2879
Interval/Time
 1493, 1554, 1557, 1578, 1580, 1591, 1676, 1693, 1699, 1720, 1731, 1734, 1882, 2004, 2053, 2073, 2077, 2138, 2735
Interview & Interviewing (see also Counseling, Guidance/Educational, Guidance/Vocational, Psychotherapy)
 2256, 2284, 2301, 2443, 2444, 2471, 2473, 2631, 2876, 3137, 3156
Introversion (SEE Extraversion-Introversion)
Intuition (SEE Thinking, Cognition)
Inventory (see also Questionnaire, Survey)
 1506, 2397, 2408, 2496, 2548, 2660, 2673, 2807, 2914, 2917, 2946, 2996, 3002, 3005, 3009, 3015, 3019, 3023, 3113, 3129, 3133, 3152, 3153, 3171
Isolation (see also Alienation)
 1565, 1698, 2014, 2035, 2100, 2309, 2312, 2695
Israel
 2234, 3134

BRIEF SUBJECT INDEX

Item (see also Test & Testing, Testing Methods)
2172, 2413, 2952

Japan
1418, 2296, 2998

Jew (SEE Religion, Ethnology)

Job (SEE next headings, Occupation, Personnel/Industrial, Work & Work Analysis)

Job Evaluation (SEE Occupation, Work & Work Analysis)

Job Performance
2447, 2799, 3134, 3155, 3156, 3161, 3162, 3164, 3166, 3168, 3169, 3170, 3171, 3176

Job Satisfaction
3158, 3159, 3160, 3161, 3163, 3165, 3167

Judgment
1486, 1487, 2113, 2206, 2258, 2273, 2276, 2277, 2288, 2377, 2388, 2412, 2706

Judgment/Perceptual (see also Perception, the various senses)
1559, 1588, 1593, 1603, 1610, 1751, 2316

Junior College (SEE College)

Junior High School (SEE School, Student/Junior High School)

Juvenile Delinquency (SEE Delinquency/Juvenile)

Kibbutz/Israel (SEE Israel)

Kindergarten (SEE Childhood/Preschool)

Kinesithesis (see also Movement)
1558, 2966

Kinship (SEE Family, Culture)

Knowledge of Results (SEE Feedback, Reinforcement, Information)

Korsakov's Psychosis (SEE Alcoholism, Brain Disorder)

Labor Relations (SEE Personnel/Industrial, Management)

Language (see also next headings, Communication, Information, Speech, Psycholinguistics, Verbal Behavior)
1556, 1715, 1740, 1746, 2160, 2166, 2170, 2184, 2320, 2329, 2342, 2345, 2347, 2351, 2353, 2354, 2359, 2427, 2605, 2865, 2967, 2969, 2970, 3049, 3062, 3093, 3114, 3120

Language Development
1890, 2127, 2162, 2165, 2357, 2821

Language/Foreign
1448, 1504, 2314, 2348, 2918, 3020, 3060, 3085, 3099, 3103, 3106, 3122, 3124

Latent Learning (SEE Learning)

Laterality
1569, 1600, 1769, 1809, 1823, 1835, 1853, 1905, 1910, 1912, 2342, 2852, 2854

Latin America
2235, 2241, 2337, 2646, 2716, 3149

Law (see also Government, Political Behavior)
2276, 2456, 2639, 2665, 2706

Leadership (see also Management)
1445, 1472, 2298, 2381, 2445, 2517, 3012

Learning (see also next headings, Association, Conditioning, School Learning, Rat/Learning in, Monkey/Learning in, Cat/Learning in, Childhood/Learning in)
1439, 1561, 1613, 1668, 1669, 1670, 1676, 1677, 1701, 1721, 2047, 2051, 2110, 2226, 2280, 2288, 2402, 2406, 3111

Learning Disorders
2194, 2424, 2668, 2768, 2961, 2963, 2981, 2982, 2983, 2984, 2986, 2987, 2988, 2989, 2990, 2992, 3039

Learning Model (SEE Model)

Learning Set (SEE Set, Expectation)

Learning Theory
1469, 1667, 1675, 1703, 1710, 1940, 2072, 2525, 2678

Learning Transfer
1671, 1701, 1710, 1732, 1741, 1851, 1937, 2067, 2200, 2147, 2148

Learning/Avoidance (see also Rat/Avoidance & Avoidance Learning in)
1674, 1714, 1900, 1929, 1950, 1963, 2047, 2070, 2073, 2770

Learning/Discrimination (see also Discrimination Reversal, Rat/Discrimination in)
1682, 1690, 1693, 1696, 1697, 1698, 1825, 2030, 2044, 2066, 2067, 2068, 2069, 2070, 2078, 2148, 2150, 2153

Learning/Escape (SEE Escape)

Learning/Incidental (SEE Learning)

Learning/Instrumental (SEE Conditioning/Operant Rat/Conditioning in)

Learning/Maze (see also Rat/Maze Learning in)
2069

Learning/Motor
1558, 1662, 1673, 2063

Learning/Over (SEE Learning)

Learning/Pairing Associate
1671, 1691, 1702, 1703, 1704, 1705, 1706, 1707, 1708, 1709, 1710, 1711, 1729, 2329

Learning/Probability
Learning/Reversal (see also Discrimination Reversal)
1823, 2050, 2064, 2155

Learning/Serial
1684, 1686, 1687, 1688, 1691, 1700, 1701, 2159

Learning/Verbal (see also Learning/Pairing Associate)
1660, 1680, 1685, 1686, 1687, 1688, 1689, 1690, 1691, 1692, 1693, 1694, 1696, 1697, 1698, 1699, 1700, 1701, 1711, 1723, 1730, 1733, 2156, 2157, 2159, 2393, 2394, 2850

Legibility (SEE Display, Writing)

Leisure (SEE Recreation)

Lesion (see also Brain Lesion, Brain Lesion-Animal, Rat/Lesions in, Cat/Lesions in)
1817, 1819, 1927, 2100

Liberalism (SEE Political Behavior, Personality Trait)

Licensing (SEE Law)

Light (see also Brightness, Color)
1559, 1563, 1567, 1568, 1577, 1587, 1588, 1589, 1598, 1599, 1664, 1817, 1871, 1890, 1901, 1902, 1904, 1906, 1977, 2033, 2062, 2855, 2857, 3195

Light Adaptation (SEE Adaptation/Sensory)

Lighting (SEE Brightness, Environment)

Liking (SEE Interpersonal Attraction)

Linguistics (SEE Language, Psycholinguistics)

Listening (SEE Attention, Audition, Speech Perception)

Literature
1453, 2362, 2582

Lobotomy (SEE Brain Lesion, Brain Lesion-Animal)

Localization
1603, 1835, 2852, 2856, 3107

Logic (see also Thinking)
1739, 2352, 2388

Loneliness (SEE Isolation, Alienation)

Longitudinal Study (SEE Experimental Design)

Loudness (SEE Audition, Noise, Sound)

Love (SEE Emotion)

Lower Class (SEE Socioeconomic Status)

LSD (SEE Lysergic Acid Diethylamide)

Luminance (SEE Brightness, Environment)

Lying (SEE Deception)

Lysergic Acid Diethylamide
1934, 1980, 1990, 1991, 2764

MA Scale (SEE Anxiety)

Machine (SEE Apparatus)

Man-Machine Systems (SEE Engineering Psychology)

Management (see also Business, Leadership)
2238, 2255, 2445, 2902, 3135, 3145, 3148, 3150, 3156, 3159, 3166, 3170, 3172, 3173, 3174

Mania (SEE Mental Disorder, Emotional Disturbance)

Manic-Depressive Psychosis (SEE Depression,

Psychosis)

Manifest Anxiety (SEE Anxiety)

Marihuana
1942, 2367, 2712

Marital Problems (see also Family Therapy)
2520, 2591, 2702, 2703, 2807

Marketing & Marketing Research (SEE Consumer Behavior)

Marriage (see also Family, Sexual Behavior)
2244, 2247, 2260, 2276, 2679, 2681, 2697, 2702, 2705, 2809, 2906

Masculinity (SEE Sex Role)

Masking (see also Interference)
1553, 1608

Masochism (SEE Sexual Deviation)

Mass Behavior (SEE Group, Social Behavior-Human)

Mass Media (SEE Communication/Mass)

Maternal Behavior (see also Mother, Parent-Child Relations, Child Rearing)
1931, 2031, 2033, 2093, 2122

Mathematics (see also Number)
1471, 1474, 1477, 1479, 1501, 1520, 1644, 1757, 1878, 1909, 2127, 2424, 2818, 2944, 2977, 3050, 3053, 3074, 3098, 3108, 2044

Mating Behavior (SEE Sexual Behavior-Animal)

Maturation (see also Development)
1910, 1923, 2036, 2094, 2115, 2203, 2580, 2601

Maudsley Personality Inventory (SEE Test/Personality)

Maze (SEE Learning/Maze, Rat/Maze Learning in, Apparatus-Animal)

Meaning (see also Semantics)
1423, 1442, 1479, 1695, 1706, 2161, 2241, 2338, 2365, 2406, 3038, 3114

Meaningfulness
1444, 1677, 1687, 1699, 1702, 1708, 2743

Measurement (see also Educational Measurement, Scaling, Statistics)
1479, 1501, 1509, 1511, 1524, 1538, 1571, 1769, 1910, 1995, 2002, 2004, 2005, 2042, 2438

Mediating Response (SEE Mediation)

Mediation
1692, 1702, 1703, 1710, 1738, 2157

Medicine (see also Nursing, Physician, Surgery)
1428, 1755, 1868, 2002, 2283, 2420, 2421, 2425, 2426, 2434, 2449, 2455, 2639, 2759, 2795, 2899, 2990, 3059, 3164

Memory (see also Recall, Recognition, Retention)
1556, 1594, 1613, 1624, 1668, 1691, 1715, 1717, 1719, 1721, 1722, 1724, 1727, 1737, 1745, 1974, 2028, 2051, 2406, 2416, 2604, 3028

Memory/Short Term
1725, 1726, 1729, 1730, 1731, 1734, 1735, 1736, 2120

Meningitis (SEE Nervous System/Disorder of)

Menstruation (SEE Biological Rhythms)

Mental Deficiency (SEE Mental Retardation)

Mental Development (SEE Development)

Mental Disorder (see also Neurosis, Psychosis, specific disorders)
2433, 2439, 2466, 2565, 2621, 2630, 2632, 2638, 2648, 2680, 2681, 2686, 2688, 2691, 2692, 2696, 2756, 2761, 2791, 2793, 2841, 2896, 2911

Mental Health (see also Adjustment/Personal & Social, Community Services)
1447, 2225, 2243, 2445, 2449, 2451, 2457, 2459, 2635, 2689, 2795, 2798, 2902, 2903, 2905, 2906, 2934, 3004

Mental Hospital & Hospitalization (see also Hospital & Hospitalization, Institution & Institutionalization)
2512, 2517, 2550, 2572, 2574, 2575, 2576, 2577, 2578, 2637, 2657, 2690, 2728, 2734, 2906, 2907, 2910

Mental Hospital/Programs in
2543, 2576, 2870

Mental Hygiene (SEE Mental Health)

Mental Patient (SEE Psychiatric Patient)

Mental Processes

BRIEF SUBJECT INDEX

1427, 1439, 1616, 1628, 1878, 2402, 2594, 2597, 2647, 2852, 3151

Mental Retardation (see also next headings, Learning, Learning Disorders)
1890, 2422, 2453, 2561, 2616, 2858, 2859, 2860, 2861, 2863, 2864, 2865, 2868, 2869, 2871, 2873, 2874, 2875, 2876, 2877, 2881

Mental Retardation/Diagnosis of
2633, 2872

Mental Retardation/Education in (SEE Education/Special-Mental Retardation)

Mental Retardation/Learning in
2859, 2868, 2879, 2880

Mental Retardation/Treatment of
2770, 2859, 2862, 2866, 2867, 2870, 2878

Mental Retardation/Vocational Rehabilitation & Training in
2796, 2882, 2883, 2884, 2885

Meprobamate (SEE Tranquilizer)

Metabolism
1758, 1841, 1843, 1916, 1922, 1948, 1951, 1970, 1978, 2775, 2888, 2893

Method & Methodology (see also Research Methods, Teaching Methods, Experimentation, Measurement, Survey, Experimental Design)
1458, 1463, 1477, 1478, 1495, 1552, 1769, 1917, 2071, 2269, 2361, 2436, 2529, 2704, 2864, 2872, 2909

Metropolitan Area (SEE Urban & Suburban Environment)

Middle Age (SEE Adulthood)

Migration (SEE Social Processes)

Millieu Therapy (SEE Mental Hospital/Programs in, Psychotherapy/Methods in)

Military (see also Personnel/Military)
1754, 2219, 3127, 3134

Mind (SEE Cognition, Thinking)

Minnesota Multiphasic Personality Inventory (MMPI)
2391, 2395, 2487, 2536, 2618, 2634, 2640, 2692, 2728, 2929, 3068

Minority Group (SEE Ethnicity)

MMPI (SEE Minnesota Multiphasic Personality Inventory)

Mobility (SEE Movement, Social Mobility, Socioeconomic Status)

Model (see also Imitation)
1469, 1470, 1471, 1472, 1473, 1478, 1502, 1503, 1574, 1663, 1774, 1803, 2015, 2018, 2084, 2190, 2263, 2334, 2352, 2354, 2431, 2605, 2640, 2672, 2876, 3093, 3188

Money
1714, 1754, 2245, 2883, 2902, 2905, 3184

Mongolism (SEE Mental Retardation)

Monitoring (SEE Detection, Attention)

Monkey
1521, 1891, 1892, 1901, 1902, 1929, 1945, 1946, 1961, 1989, 2029, 2036, 2093, 2095, 2101, 2104, 2107, 2727

Monkey/Learning in
2029, 2045, 2048, 2088, 2277

Mood (SEE Emotion)

Morale (SEE Job Satisfaction, Attitude, Emotion)

Morality (SEE Value & Values, Religion, Ethics)

Mother (see also Maternal Behavior, Mother-Child Relations, Parent)
2125, 2194, 2196, 2199, 2200, 2390, 2420, 2519, 2590, 2699, 2860, 2868, 2876, 2899, 2999, 3094

Mother-Child Relations (SEE Parent-Child Relations, Child Rearing)

Motion (SEE Movement)

Motion Pictures (SEE Film)

Motivation (see also next headings, Achievement Motivation, Incentive, Reinforcement)
1647, 1713, 1717, 1763, 1786, 1794, 1806, 2144, 2194, 2245, 2375, 2377, 2399, 2927, 2936, 3057, 3126, 3153, 3162, 3167

Motivation-Animal (see also Rat/Motivation in)
1763, 2041

Motivation/Learning (SEE Learning, Motivation)

Motivation Theory
1655, 1940

Motor Disorder
2828, 2966

Motor Learning (SEE Learning/Motor)

Motor Performance
1524, 1542, 1558, 1584, 1628, 1653, 1654, 1661, 1662, 1997, 2139, 2172, 2406, 2869, 2879, 3056, 3189, 3193

Motor Processes (see also Learning/Motor, Muscle)
1513, 1533, 1554, 1766, 1821, 1829, 1854, 1883, 1895, 1898, 1946, 1987, 2058, 2723, 2971

Motor Skill (SEE Motor Performance)

Mouse
1926, 1950, 1970, 1978, 1981, 1986, 2007, 2016, 2030, 2034, 2069, 2097, 2099

Mouth (SEE Body)

Movement (see also Social Movements)
1513, 1516, 1563, 1574, 1578, 1581, 1585, 1629, 1765, 1773, 1781, 1829, 1901, 1902, 2103, 2114, 2307, 3055, 3082, 3087, 3175

Movement/Apparent (SEE Gestalt Psychology, Visual Perception)

Muller-Lyer Illusion (SEE Illusion)

Multiple Sclerosis (SEE Disease, Nervous System/Disorder of)

Murder (SEE Crime & Criminals)

Muscle (see also Electromyography)
1513, 1524, 1551, 1628, 1689, 1795, 1797, 1854, 1856, 1868, 2139, 2141, 2537, 2693, 2694, 2787, 2831

Muscle Sense (SEE Kinesthesia, Somesthesia)

Musical
2112, 2344, 2361, 2363, 2364, 2365, 2611, 2714, 2770, 3013, 3091, 3097, 3117, 3118, 3121

Mutism (SEE Speech/Defective)

Myth & Mythology (SEE Culture)

Narcissism (SEE Psychoanalytic Theory, Neurosis, Personality Trait)

Narcosis (SEE Sleep, Drug Therapy)

Narcotics (SEE Drugs, Drug Addiction)

Natural Observation (SEE Observation)

Navy (SEE Military, Personnel/Military)

Need (see also Motivation)
1613, 2207, 2295, 2302, 2387, 2411, 2790, 2923, 3150, 3160

Need Achievement (SEE Achievement Motivation)

Negro
2136, 2140, 2146, 2163, 2174, 2183, 2185, 2194, 2221, 2223, 2254, 2276, 2278, 2287, 2363, 2546, 2948, 3005, 3006, 3011, 3029, 3120, 3179

Neonate (see also Infancy)
1798, 2118, 2121, 2122

Nerve (SEE Neurology, Neuroanatomy)

Nervous System (see also next headings)
1790

Nervous System/Autonomic
1778, 1813, 1819, 1965, 2531, 2640, 2693, 2894

Nervous System/Central
1535, 1761, 1780, 1793, 1928, 1935, 1945, 1955, 1956, 1959, 2046, 2835, 2845

Nervous System/Disorder of
1510, 1789, 1826, 1953, 2011, 2432, 2549, 2559, 2565, 2580, 2762, 2776, 2777, 2780, 2783, 2786, 2788, 2791, 2792, 2796, 2826, 2827, 2828, 2830, 2831, 2832, 2833, 2835, 2836, 2837, 2838, 2839, 2840, 2841, 2842, 2843, 2844, 2845, 2846, 2847, 2848, 2849, 2851, 2852

Neuroanatomy
1764, 1780, 1787, 1809, 1810, 1813

Neuroanatomy-Animal
1764, 1809, 1811, 1812, 1877, 1891, 1892, 1947

Neurology
1494, 1497, 1513, 1764, 1778, 1779, 1780, 1783, 1784, 1785, 1786, 1787, 1788, 1789, 1790, 1791, 1792, 1794, 1796, 1797, 1799,

1800, 1801, 1802, 1804, 1805, 1806, 1807, 1808, 1810, 1933, 2002, 2005, 2440, 2846, 2895

Neurology-Animal
1535, 1764, 1778, 1795, 1798, 1816, 1824, 1831, 1838, 1842, 1845, 1849, 1853, 1855, 1857, 1860, 1866, 1871, 1872, 1889, 1904, 1914, 1953, 1966, 1983, 1993, 2007, 2011

Neuron (SEE Neurology, Neuroanatomy)

Neurophysiology (SEE Neurology, Neuroanatomy)

Neurosis & Neuroticism (see also specific neuroses)
2315, 2396, 2470, 2513, 2560, 2566, 2567, 2587, 2626, 2629, 2636, 2638, 2659, 2665, 2684, 2697, 2702, 2704, 2705, 2706, 2708, 2709, 2710, 2769, 2771, 2981

News & Newspaper (SEE Communication/Mass)

Nicotine (SEE Smoking, Drugs, Biochemistry)

Nitricating Membrane (SEE Eye, Conditioning/Eyelid)

Noise (see also Audition, Sound)
1508, 1559, 1564, 1599, 1602, 1664, 1760, 1890, 2177, 2693, 2879, 3125

Nondirective Therapy (SEE Psychotherapy/Methods in)

Nonsense & Nonsense Syllables (SEE Association, Learning/Paired Associate, Word)

Nonverbal Communication (SEE Communication/Nonverbal)

Noradrenalin (SEE Hormone)

Norepinephrine (SEE Hormone)

Norm (see also Value & Values, Social Influence)
1501, 2303, 2663, 2951, 2968

Novelty (SEE Familiarity)

Number (see also Mathematics)
2170

Nursery School (SEE Childhood/Preschool)

Nursing & Nurses (see also Medicine, Personnel/Psychological)
2312, 2442, 2620, 2628, 3127, 3129, 3165

Nutrition (SEE Food)

Nystagmus (SEE Eye Movement)

Obesity (SEE Physique)

Obituaries
1418

Observation
1468, 1509, 1510, 2032, 2042, 2044, 2048, 2129, 2507, 2574, 3014

Obsession-Compulsion (see also Mental Disorder, Neurosis, Psychosis, Personality Trait)
2583, 2704, 2772

Occupation (see also Personnel/Industrial, Work & Work Analysis)
2197, 2207, 2218, 2229, 2240, 2244, 2247, 2383, 2686, 2817, 2906, 2994, 3003, 3005, 3085, 3132, 3162, 3178

Occupational Choice (see also Guidance/Vocational)
3006, 3008, 3009, 3131

Occupational Interest
1506, 2882, 2994, 2998, 3003, 3041, 3051, 3129, 3130, 3131, 3133

Occupational & Physical Therapy
2714

Oceanography (SEE Environment)

Oedipus (SEE Psychoanalytic Theory)

Old Age (SEE Geriatrics, Gerontology)

Olfaction (SEE Smell)

Open-Field Behavior (SEE Activity, Rat/Activity in)

Operant Behavior (SEE Conditioning/Operant)

Opinion (see also Attitude)
2271, 2272, 3013

Optic Nerve (SEE Neurology, Neuroanatomy)

Oral Character (SEE Psychoanalytic Theory)

Organ Implantation & Transplantation (SEE Surgery)

Organizational Structure
2576, 3126, 3144, 3153, 3157, 3160, 3163,

BRIEF SUBJECT INDEX

- 3170, 3171, 3172, 3174
- Organizations**
1441, 1451, 2223, 2251, 2337, 2431, 2439, 2451, 2632, 3138, 3149, 3158
- Orientation**
1561, 1577, 1630, 1827, 1839, 2027, 2038, 2039, 2043, 2180, 2244, 2301, 2302, 2408, 2917, 2924, 2930, 3040, 3107
- Orienting Response** (SEE Orientation)
- Outpatient** (SEE Treatment/Outpatient)
- Overlearning** (SEE Learning)
- Oxygen** (SEE Respiration, Biochemistry)
- Pain** (see also Somesthesia)
1663, 1780, 1952, 1962, 1981, 2729, 2755
- Paired Associate Learning** (SEE Learning/ Paired Associate)
- Palsy** (SEE Nervous System/Disorder of, Physical Handicap)
- Paralysis** (SEE Nervous System/Disorder of, Physical Handicap)
- Paranoia** (see also Psychosis, Neurosis, Schizophrenia, Personality Trait)
2685, 2716, 2777, 2781
- Parapsychology**
1438
- Parent** (SEE Father, Mother, Parent-Child Relations)
- Parent-Child Relations** (see also Family Relations)
2125, 2173, 2175, 2195, 2196, 2199, 2200, 2235, 2519, 2622, 2637, 2639, 2676, 2699, 2711, 2868, 2982, 2983, 2984, 2988, 3073, 3091, 3094
- Parkinson's Disease** (SEE Nervous System/ Disorder of)
- Pastoral Counseling** (SEE Counseling)
- Paternal Deprivation** (SEE Father, Parent-Child Relations)
- Pathogenesis** (SEE Etiology)
- Patient** (see also Psychiatric Patient)
2421, 2427, 2521
- Pattern**
1563, 1590, 1593, 1605, 1751, 1842, 2038, 2236, 2724
- Peace** (SEE International Relations, War)
- Peace Corps** (SEE Government, International Relations)
- Peak Experience** (SEE Emotion)
- Peer Rating** (SEE Peers)
- Peers**
2113, 2240, 2674, 2930, 3006, 3057, 3134
- Penitentiary** (SEE Prison)
- Perception** (see also next headings, Intersensory Processes, Childhood/Perception in)
1418, 1422, 1429, 1556, 1627, 1673, 1780, 2116, 2120, 2172, 2282, 2310, 2936, 3196
- Perception/Auditory** (SEE Auditory Perception)
- Perception/Depth**
1567, 1585, 1586, 1665
- Perception/Form & Shape**
1556, 1577, 1590, 1591, 1592, 1594, 1595, 1780, 1909
- Perception/Size**
1558, 1585, 1586, 1591, 2743
- Perception/Social** (SEE Social Perception)
- Perception/Space**
1780, 2114, 2180, 2184, 2951, 3055
- Perception/Time**
1564
- Perception/Visual** (SEE Visual Perception)
- Perception/Weight** (SEE Weight, Perception)
- Perceptual Defense** (SEE Defense Mechanism)
- Perceptual Isolation** (SEE Isolation, Deprivation/Sensory)
- Performance** (see also Job Performance, Motor Performance)
1470, 1636, 1659, 1765, 1807, 1863, 1886, 3178
- Perseveration** (SEE Personality Trait, Thinking)
- Personality** (see also next headings, Childhood/Personality in, Teacher Attitudes & Personality, the various personality traits)
1453, 1620, 1627, 1629, 2201, 2207, 2229, 2283, 2358, 2378, 2398, 2528, 2601, 2612, 2670, 2702, 2923, 3042, 3050, 3162
- Personality Change**
2465, 2548, 2660, 2852, 3026, 3086
- Personality Correlates**
1910, 2020, 2022, 2111, 2237, 2374, 2386, 2388, 2389, 2390, 2391, 2393, 2394, 2395, 2396, 2397, 2418, 2659, 2693, 2694, 2722, 2799, 2890, 2917, 2923, 2932, 3008, 3036, 3082, 3183
- Personality Diagnosis** (SEE Personality Measurement, Test/Personality)
- Personality Disorder** (SEE Emotional Disturbance, Neurosis)
- Personality Inventory** (SEE Personality Measurement)
- Personality Measurement**
2371, 2409, 2412, 2886, 2941, 3108
- Personality Test** (SEE Test/Personality)
- Personality Theory**
2228, 2373, 2661, 3132
- Personality Trait** (see also Inventory)
1742, 2185, 2277, 2284, 2318, 2328, 2334, 2356, 2374, 2378, 2379, 2392, 2470, 2500, 2547, 2599, 2634, 2669, 2709, 2803, 2886, 2936, 3136, 3139
- Personality/Assessment of** (SEE Personality Measurement)
- Personality/Childhood** (SEE Childhood/Personality in)
- Personnel** (see also next headings)
2255, 3012, 3080, 3126, 3140, 3157, 3160
- Personnel/Industrial**
2384, 3078, 3125, 3135, 3138, 3139, 3147, 3150, 3152, 3153, 3154, 3155, 3158, 3163, 3169, 3171, 3172, 3173, 3174, 3191
- Personnel/Military**
1644, 1750, 1917, 2712, 2723, 3136, 3142, 3143, 3146, 3164, 3165, 3168, 3176

- Rat/Maze Learning in** 1823, 1974, 2050, 2053
- Rat/Motivation in** 1814, 1848, 1849, 2040, 2053
- Rat/Reinforcement & Reinforcement Schedule in** 1762, 1831, 1836, 1848, 1850, 1949, 2052, 2065, 2074, 2076, 2077, 2079, 2081, 2085
- Rat/Shock & Shock Effects in** 1831, 1924, 1952, 1957, 1962, 2008, 2055, 2072
- Rat/Stress Effects in** 2006, 2008, 2009, 2010, 2011, 2012
- Rating** (see also Rating Scale) 1588, 1600, 2333, 2353, 2618, 3069, 3071, 3154, 3155, 3166
- Rating Scale** 2187, 2412, 2620, 2635, 3016, 3185
- Reaction Time** 1533, 1569, 1604, 1661, 1663, 1664, 1665, 1666, 1870, 1939, 2107, 2390, 3178, 3196
- Readability** (SEE Display, Writing)
- Reading** 1505, 1553, 1671, 2116, 2159, 2162, 2168, 2184, 2347, 2351, 2355, 2882, 2946, 2948, 2953, 2966, 2972, 3034, 3035, 3038, 3045, 3049, 3056, 3062, 3069, 3070, 3073, 3079, 3081, 3097, 3109, 3110, 3114, 3120
- Reading Deficiency** (see also Education/Special—Remedial) 2162, 2711, 2768, 2844, 2963, 2968, 2970, 2972, 2973, 2981, 2982
- Reasoning** (SEE Logic, Thinking, Cognition, Categorical Behavior)
- Recall** (see also Memory, Recognition, Retention) 1620, 1621, 1645, 1689, 1703, 1706, 1711, 1716, 1719, 1720, 1724, 1726, 1727, 1731, 1732, 1733, 1734, 1735, 1937, 2406
- Recognition** (see also Memory, Recall, Retention) 1590, 1591, 1592, 1660, 1669, 1711, 1721, 1722, 1725, 1733, 1740, 2184
- Recreation** 1997, 2240, 2391, 2714, 2869
- Redundancy** (SEE Information Theory)

BRIEF SUBJECT INDEX

- Reflex** (see also Conditioned Response, Response, Muscle)
1517, 1554, 1555, 1630, 1820, 2046, 2848, 3107
- Regression** (SEE Personality, Behavior Problems, Statistics)
- Rehabilitation** (see also Counseling, Rehabilitation/Vocational, Education/Special-Remedial)
2619, 2641, 2714, 2758, 2796, 2797, 2907
- Rehabilitation/Vocational** (see also Mental Retardation/Vocational Rehabilitation & Training in)
2447, 2799
- Reinforcement** (see also next headings, Rat/Reinforcement & Reinforcement Schedule in)
1678, 1712, 1763, 2066, 2075, 2084, 2143, 2153, 2190, 2380, 2543, 2881, 2883, 2964, 3087
- Reinforcement Schedule**
1526, 1670, 1672, 1683, 1714, 1967, 1968, 2048, 2054, 2066, 2078, 2080, 2082, 2083, 2084, 2086, 2090, 2107, 2131, 2138, 2143, 2152
- Reinforcement Theory**
1712, 2079
- Reinforcement/Delayed** (SEE Reinforcement Schedule)
- Reinforcement/Partial** (SEE Reinforcement Schedule)
- Reinforcement/Secondary** (SEE Reinforcement)
- Reinforcement/Social**
1707, 1713, 2150, 2153, 2805, 3040, 3047, 3094
- Relaxation** (SEE Behavior Therapy, Muscle)
- Reliability**
1476, 1490, 1498, 1503, 1507, 1600, 2134, 2410, 2413, 2414, 2939, 2942, 2958, 3014
- Religion**
1884, 2218, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2253, 2363, 2384, 2437, 2450, 2453, 2485, 2612, 2810, 2919, 2920, 2934, 3021
- REM** (SEE Rapid Eye Movement)
- Reminiscence** (SEE Memory, Recall)
- Remission** (SEE Mental Hospital & Hospitalization, Hospital & Hospitalization)
- Repetition** (SEE Stimulation, Familiarity)
- Replication** (SEE Contribution & Criticism)
- Repression**
1649, 1650, 2387, 2389, 2393, 2484
- Reptile** (SEE Animals)
- Research** (see also Experimentation)
1441, 1452, 1459, 1466, 1467, 1478, 1626, 1631, 1639, 1788, 1941, 2127, 2306, 2343, 2615, 2806, 2864, 2916
- Research Methods**
1460, 1461, 1462, 1464, 1465, 1468, 1496, 1509, 1511, 1517, 1534, 1539, 1856, 1865, 1867, 1885, 1981, 2000, 2027, 2213, 2217, 2223
- Reserpine** (SEE Tranquilizer)
- Residential Treatment** (SEE Mental Hospital & Hospitalization, Hospital & Hospitalization, Institution & Institutionalization)
- Respiration**
1524, 1529, 1530, 1542, 1546, 1681, 1768, 1773, 1888, 1944, 1955, 2006, 2060, 2062, 2541, 2687, 2759, 2786, 2848
- Response** (see also Conditioned Response, Conditioned Emotional Response)
1554, 1555, 1576, 1601, 1604, 1665, 1667, 1895, 2035, 2046, 2081, 2105, 2121, 2150, 2169, 2390
- Response Latency** (SEE Reaction Time)
- Response Set** (SEE Set)
- Response/Delayed** (SEE Response)
- Retardate** (SEE Mental Retardation)
- Retention** (see also Memory, Recall, Recognition)

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.).—(10) *Journal abstract*.

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., (*Parapsychology*).

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA—*Psychological Abstracts*.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the PA issue noted in order to determine the abstract number for the author and article cited.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title.

5—Place of publication.

6—Publisher's name.

6a—Year of publication.

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol. 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first-named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.

4a—Editor's name.

4b—Editor designation.

4c—Book title.

5—Referral information.

5a—PA—*Psychological Abstracts*.

5b—Volume number.

5c—Issue number.

6—Inclusive pagination for cited chapter.

ABBREVIATIONS

Abbreviations appearing in this issue include along with units of measurement (e.g., in. = inch, wk. = week, hr. = hour, etc.);

AA	= Alcoholics Anonymous	PM	= post meridiem
AC	= alternating current	pps	= pulses per second
ACTH	= adrenocorticotrophic hormone	PRE	= partial reinforcement effect
AM	= ante meridiem	PSI	= point of subjective equality
amp.	= ampere	psi	= pounds per sq. in.
bpm	= beats per minute	r	= product-moment correlation
C	= centigrade	r	= roentgen
c	= cents	REM	= rapid eye movement
CA	= chronological age	rms	= root mean square
cc	= cubic centimeter	RNA	= ribonucleic acid
CER	= conditioned emotional response	rpm	= revolutions per minute
CF	= critical flicker frequency	RT	= reaction time
CNS	= central nervous system	S	= subject
cps	= cycles per second	SEU	= subjectively expected utility
CR	= conditioned response (or reflex)	SPL	= sound pressure level
CRF	= continuous reinforcement	TV	= television
CRT	= cathode ray tube	UCR	= unconditioned response
CS	= conditioned stimulus	UCS	= unconditioned stimulus
CVC	= consonant-vowel-consonant	UHF	= ultrahigh frequency
db	= decibel	V	= volt
DC	= direct current	VHF	= very high frequency
DL	= differential limen	vs.	= versus
DNA	= deoxyribonucleic acid	YMCA	= Young Men's Christian Association
DRL	= differential reinforcement of low rates	YWCA	= Young Women's Christian Association
E	= experimenter		
ECS	= electroconvulsive shock		
EEG	= electroencephalogram (or -graphy)		
EKG	= electrocardiogram		
EMG	= electromyogram		
ESP	= extrasensory perception		
Exp.	= experiment		
F	= Fahrenheit		
ft-c	= foot-candle		
ft-l	= foot-lambert		
g	= gravity		
gm.	= gram(s)		
GPA	= grade-point average		
GSR	= galvanic skin response		
Hz.	= Hertz		
ICS	= intracranial stimulation		
im	= intramuscularly		
ip	= intraperitoneally		
IQ(s)	= intelligence quotient(s)		
ITI	= intertrial interval		
iv	= intravenously		
kc.	= kilocycle		
kg.	= kilogram		
kg/m	= kilogram per meter		
kHz.	= kilo-Hertz		
LD	= lethal dose		
LSD	= lysergic acid diethylamide		
m.	= meter		
M	= mean		
M	= mole or molar		
ma.	= milliampere		
MA	= mental age		
MAO	= monoaminooxidase		
mL.	= millilambert		
mm.	= millimeter		
mph	= miles per hour		
msec.	= millisecond(s)		
N	= number

GENERAL

3198. Craig, Robert J. (Chicago State Hosp., Ill.) **A paradigm for evaluative research reviews.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 366-368.—Presents satirical advice for writers of research reviews to demonstrate that "consulting editors have been conditioned to a style of presentation and any deviation from it may result in manuscript rejection."

OBITUARIES

3199. ———. **Pamyati Dmitriya Andreevicha Biryukova.** [To the memory of Dmitrii Andreevich Biryukov.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 901-903.—Recounts the scientific life and work of D. A. Biryukov (1904-1969), known for his contributions to evolutionary physiology and to the ecological physiology of nervous activity.—I. D. London.

HISTORY

3200. Banshchikov, V. M. S. **S. S. Korsakov (1854-1900): Zhizn' i tvorchestvo.** [S. S. Korsakov (1854-1900): Life and creativity.] Moscow, USSR: Meditsina, 1967, 340 p.—Recounts the life and work of 1 of the founders of Russian psychiatry, "reflecting the many facets of his personality, his role and significance in science, [and] his creativity." There are chapters devoted to the sources of his Weltanschauung and creative activity, his philosophical and psychological views, and his relationship with Leo Tolstoy.—I. D. London.

3201. Faber, M. D. **Allport's visit with Freud.** *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 60-64.—Discusses Allport's misinterpretation of Freud's words derived from his unfortunate preconceptions of Freud and Freudian psychology as well as from his need to suppress from consciousness the fact that he had been caught in a foolish, deceptive posture.—D. Prager.

PHILOSOPHY

3202. Wiatr, E. **Szkice o materializmie historycznym i socjologii.** [An essay on historical materialism and sociology.] Warsaw, Poland: Książka i Wiedza, 1967, 242 p.—Includes a Marxist analysis of the sociology and psychology of political behavior.—I. D. London.

PARAPSYCHOLOGY

3203. Honorton, C. **Effects of feedback on discrimination between correct and incorrect ESP responses.** *Journal of the American Society for Psychical Research*, 1970(Oct), Vol. 64(4), 404-410.—Tested the effects of feedback (knowledge of results) on Ss' ability to discriminate between correct and incorrect ESP

responses. 20 Ss were randomly assigned to an experimental or control group. The 10 experimental Ss completed 3 ESP card-guessing runs in which they made confidence calls (indicating responses they felt relatively confident were correct), followed by 3 runs with feedback and an additional 3 runs with confidence calls. The same procedure was followed for the 10 controls except that they received false feedback (they were told their responses were correct when they were not). The hypothesis that the proportion of correct confidence calls would increase following feedback was confirmed ($p = .02$, 2-tailed). Overall run scores were also significantly higher following feedback ($p = .02$, 2-tailed).—R. A. White.

3204. Moss, Thelma; Chang, Alice F., & Levitt, Marc. (U. California, Neuropsychiatric Inst., Los Angeles) **Long-distance ESP: A controlled study.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 288-294.—Using a group of 22 transmitters (Ts) in Los Angeles, and 3 groups of receivers (Rs) in Los Angeles (N = 28), New York (N = 15), and Sussex, England (N = 14), a long-distance ESP study was conducted in which a series of 3 emotional episodes and 3 control episodes were shown Ts in Los Angeles. After each episode, Ts wrote their reactions, while at the same (local) time, Rs wrote their free associations. After writing these impressions, Rs were shown a pair of slides and chose the 1 slide which best matched their impressions. Results show that the 57 Rs scored significantly beyond chance expectations ($p < .003$) for the experimental episodes but only at chance for the controls. Qualitative results are reviewed, and a few striking parallels between T and R protocols are noted.—Journal abstract.

3205. Nash, C. B. **Cutaneous perception of color with a head box.** *Journal of the American Society for Psychical Research*, 1971(Jan), Vol. 65(1), 83-87.—Ss who wore a head box to preclude visual cues could distinguish the color of red or black paper when it was uncovered or covered by thin clear plastic .03-mm thick, but not when it was covered with picture glass $\frac{1}{8}$ in. in thickness. Greater infrared radiation was transmitted by the plastic than by the glass. Presumably neither the plastic nor the glass would produce a differential between the 2 colors of paper with respect to touch or ESP. These facts suggest that nonvisual identification of color was accomplished by cutaneous perception of infrared radiation and not by touch or ESP. The results are in accord with the hypothesis that the different infrared emissivities of different colors would differ in the skin temperatures they induce.—Journal abstract.

3206. Osis, K. & Bokert, E. **ESP and changed states of consciousness induced by meditation.** *Journal of the American Society for Psychical Research*, 1971(Jan), Vol. 65(1), 17-65.—An experiment based upon a theoretical model was designed to explore the relationship between ESP processes and changed states of consciousness induced by meditation. A pilot study and 2 experiments were performed over a 3-yr period. The

changed states at each session were ascertained by means of scaled item questionnaires and free tape-recorded descriptions. 2 tests were used: a closed circuit TV version of Brugmans' test and a slide test. The questionnaire responses were factor analyzed and 3 stable replicated factors obtained; 1 additional factor was partially replicated. Factor scores of the stable factors, self-transcendence and openness in particular, were found to be associated with ESP. However, the "gating" of ESP to consciousness often was not swayed by the changed states processes and followed individual patterns.—*Journal abstract.*

3207. Parker, A. & Beloff, J. (U. Edinburgh, Scotland) **Hypnotically-induced clairvoyant dreams: A partial replication and attempted confirmation.** *Journal of the American Society for Psychical Research*, 1970(Oct), Vol. 64(4), 432-442.—A replication of a method previously used by Honorton and Stump involving a hypnotic dream technique, art-card targets, and blind matching of dream reports to targets by S and judge was partially successful at the .02 level. A decline between the 2 sessions of the experiment was significant at almost the .01 level. A follow-up attempt at confirmation, however, was unsuccessful and analyses carried out to see whether scores were related to the Ss' estimates of hypnotic depth and type of dream also yielded null results.—*Journal abstract.*

3208. Stanford, R. G. & Lovin, C. (U. Virginia) **EEG alpha activity and ESP performance.** *Journal of the American Society for Psychical Research*, 1970(Oct), Vol. 64(4), 375-384.—30 male college-age students were each given 2 precognition runs using standard ESP symbols. For several minutes before ESP testing and throughout it, monopolar right occipital EEG was recorded. The frequency (Hz.) of alpha rhythms during the pretest (relaxation) period correlated -.41 with the total ESP score ($p < .04$, 2-tailed). The frequency of alpha during ESP testing did not correlate significantly with ESP scoring. Change in alpha frequency from pretest period to the ESP testing correlated +.51 with total ESP score ($p < .01$, 2-tailed). Additionally, correlations are reported between the percentage of time alpha was present in the record and ESP performance. These latter correlations, however, are regarded as inconclusive and reasons are discussed.—R. A. White.

3209. Stump, J. P., Roll, W. G., & Roll, M. **Some exploratory forced-choice ESP experiments with Lalsingh Harribance.** *Journal of the American Society for Psychical Research*, 1970(Oct), Vol. 64(4), 421-431.—7 series of forced-choice ESP experiments were performed with a single, selected S. In each series, S attempted to guess the sex of persons shown in concealed photographs. 3 of the series yielded statistically significant results, including Series 7 in which a 2-E design was employed. The 50 runs (500 trials) in this series produced a critical ratio of 5.45 ($p < 10^{-7}$). The results also suggest that conscious deliberation, as in the attempt to balance calls, suppressed this S's ESP.—*Journal abstract.*

THEORY & SYSTEMS

3210. Jones, Jack. **Herbert Marcuse and the cunning of revolution.** *Michigan Quarterly Review*, 1970(Apr), Vol. 9(2), 71-84.—Discusses the ideas of Herbert Marcuse, considered by many to be the foremost surviving Marxist philosopher, and attempts to apply depth-psychological concepts to sociopolitical concerns.

3211. Siomopoulos, V. (U. Illinois) **Formal mechanisms of affective experience: Outline for a formal theory of affect.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 306-314.—Expands on Piaget's basic ideas and outlines a formal theory of affect applying to normality as well as psychopathology. Affect as form, primary and secondary affect, and formal affect disturbances are discussed.—D. Prager.

EDUCATION & TRAINING

PROFESSIONAL DEVELOPMENTS

3212. Brackbill, Yvonne & Korten, Frances. (Georgetown U., Medical School) **Journal reviewing practices: Authors' and APA members' suggestions for revision.** *American Psychologist*, 1970(Oct), Vol. 25(10), 937-940.—Reports results of a survey designed to determine ways to improve the review of manuscripts submitted to psychological journals. A 22-item questionnaire, derived from results of an earlier pilot survey, was sent to 247 authors of articles recently published in 84 United States psychological journals, and 321 persons selected randomly from the 1966 *American Psychological Association Directory*. 311 respondents provided ratings on a 5-point scale to each questionnaire item. Results (represented by mean ratings for each of the 22 suggestions) indicate that respondents' main concerns involve: (a) publication lag, (b) characteristics of the manuscript reviewers (i.e., their goals, values, and knowledge of the topic), and (c) the relative status of author and reviewer (i.e., who should be anonymous and who should not). Respondents expressed a preference for the anonymity of both author and reviewer.—P. McMillan.

3213. Fadiman, James. **The Council Grove Conference on Altered States of Consciousness.** *Journal of Humanistic Psychology*, 1969(Fal), Vol. 9(2), 135-137.

3214. Kinkade, R. G. (American Psychological Assn., Washington, D.C.) **The Experimental Publication System: An aid to information system planning.** *American Psychologist*, 1970(Oct), Vol. 25(10), 925-936.—Examines the rationale, implementation, and evaluation of Experimental Publication System (EPS) characteristics. During its 1st yr. of operation, EPS distributed bimonthly separates, accompanied by evaluative questionnaires on specific aspects of the system. Questionnaire data show that respondents ranked EPS characteristics as follows: prompt dissemination, most desirable; focused distribution, 2nd; diversity of content and catalog of abstracts, 3rd; and articles printed separately and low acceptance criteria, least desirable. Subscriber, manuscript, author, and reprint ordering characteristics of the system are analyzed for the 1st yr. Innovations which have been added include active solicitation of different types of manuscripts, improvements to the catalog of abstracts, and modification and expansion of subject matter categories.—*Author abstract.*

3215. Kubie, Lawrence S. (Wheeler Lane, Sparks, Md.) **Problems of multidisciplinary conferences, research teams, and journals.** *Perspectives in Biology & Medicine*, 1970(Spr), Vol. 13(3), 405-427.—Postulates the increasing necessity of multidisciplinary efforts for solution of scientific problems, and discusses dynamics of personal relationships among scientists from different fields as they relate to impairment of group efficiency. Some concepts discussed are reluctance to change,

communication barriers, and personal psychological difficulties such as gender identity uncertainties. It is concluded that some form of psychotherapeutic sensitization to self and group problems should be a requisite for participation in multidisciplinary efforts. (18 ref.)—*J. Crabbe*.

3216. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Social responsibility and the results of experiments.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 139-141.—Discusses the dangers inherent in the premature publication of research findings. The tendency of news media to focus on remarkable findings and to ignore any failures to replicate these findings serves to create myths among the general public which may necessitate extensive programs of reeducation.—*Author abstract*.

INTERNATIONAL PSYCHOLOGY

3217. Bانشchikov, V. M. **Vsesoyuznoe nauchnoe meditsinskoe obshchestvo nevropatologov i psikhiatrov.** [The All-Union Scientific Medical Society of Neuropathologists and Psychiatrists.] Moscow, USSR: Meditsina, 1967. 236 p.—Presents the history and activities of the Society from the time of its founding in 1878 as the Moscow Society of Neuropathologists and Psychiatrists, later also called the Russian Union of Neuropathologists and Psychiatrists.—*I. D. London*.

3218. Moreno, J. L. (Moreno Inst., Beacon, N.Y.) **Open letter to the members of the International Council of Group Psychotherapy.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 89-90.—Presents a brief summary of the activities of the 4th International Congress of Group Psychotherapy, held in Vienna in 1968.—*A. Krichev*.

3219. Robinson, R. J. (Ed.) (London U., Inst. of Child Health, England) **Brain and early behaviour: Development in the fetus and infant.** London, England: Academic Press, 1969. xvi, 374 p. \$15.

GENERAL BOOKS & REFERENCE WORKS

3220. Bartz, Wayne H. (Ed.) (Iowa State U.) **Readings in general psychology.** Boston, Mass.: Allyn & Bacon, 1968. vii, 680 p. —Contains a collection of articles designed to supplement the volume. *General Psychology*, by James Deese. The book includes a representative sample of contemporary scientific psychological publications by various authors, including presidential addresses, short notes, research reports, and review papers.

3221. Krimmerman, Leonard I. (Ed.) (U. Connecticut) **Nature and scope of social science: A critical anthology.** New York, N.Y.: Appleton-Century-Crofts, 1969. xi, 796 p. \$12.—Attempts to identify the proper aims, methods, and concepts of the social sciences to determine how the scientific community can best investigate human conduct, and how much of the latter can be understood, measured, explained, and predicted by the former.

METHODOLOGY & RESEARCH TECHNOLOGY

3222. Haycraft, Sarah L. (U. Kentucky) **A comparison of three psychophysical techniques in the**

measurement of cognitive reinforcing values. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 395.

MODELS & MATHEMATICAL MODELS

3223. Evans, Selby H. (Texas Christian U., Inst. for the Study of Cognitive Systems) **The random adaptive module (RAM): A formal system for S-R modeling, with applications to schema theory.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1969(Dec), No. 24-69, 18 p.—Proposes a method of model construction to facilitate the achievement of relatively complex processes by combinations of basic stimulus-response units. A basic process resembling stimulus-response learning is used to construct a model capable of learning to recognize and reproduce a pattern or schema. In the context of schema theory, this model is further developed to simulate the process of learning to distinguish 1 schema from another (schematic concept formation). Results of a computer simulation and comparison with human performance are reported; substantial correspondence is demonstrated between the human performance and that of the model. (20 ref.)—*Journal abstract*.

3224. Nakatani, Lloyd H. (Bell Telephone Lab., Murray Hill, N.J.) **Comments on Broadbent's response bias model for stimulus recognition.** *Psychological Review*, 1970(Nov), Vol. 77(6), 574-576.—A theoretical analysis of D. E. Broadbent's (see PA, Vol. 41:4542) stimulus recognition models for the word-frequency effect reveals that his general response bias model (Model 4) is mathematically equivalent to the general pure guessing model (Model 1). It is also proven that Model 4 cannot predict the pattern of errors which results from recognition experiments.—*Journal abstract*.

MATHEMATICS & STATISTICS

3225. Brewer, James K. & Hills, John R. (Florida State U.) **Univariate selection: The effects of size of correlation, degree of skew, and degree of restriction.** *Psychometrika*, 1969(Sep), Vol. 34(3), 347-361.—Examined the influence of skew upon estimates from Pearson's formula under certain conditions. It was found that even with essentially symmetric distributions, a large proportion of the data was necessary to obtain reasonably precise estimates of low correlations. With increasing skew, estimates became increasingly erroneous, the direction of the error dependent upon which tail of the distribution was the basis of the estimates. Difficulties in applying correction for univariate selection in several studies of the predictability of college grades for Negroes from scores on standard aptitude tests are discussed.—*Journal abstract*.

3226. Burton, Roger V. (National Inst. of Mental Health, Lab. of Socio-Environmental Studies, Bethesda, Md.) **Validity of retrospective reports assessed by the multitrait-multimethod analysis.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 2), 15 p.—Nursery school records of 190 children, a retrospective interview with 224 mothers, and a retrospective questionnaire administered to the child served as 3 sets of related data with 50 matched measures in each set. Convergent and discriminant validity was assessed by the multitrait-multimethod procedure. Directly observable, objective measures, e.g., height, weight, showed satisfactory validity; variables relevant for personality theory, e.g.,

child personality, and parental rearing, consistently demonstrated low validity. The children's measures proved most productive of significant, monomethod correlations. It is suggested that the child learned not only information about his early childhood from his mother, but also her beliefs about child rearing. The more latitude the respondent had in estimating a rating, the more he imposed his own implicit psychological notions on his answers. An assessment of the multitrait-multimethod procedure emphasized 4 issues: (a) the most appropriate time to apply such a procedure; (b) the potentially inappropriate application to sets of data whose suitability for this procedure should be rejected on other grounds; (c) the weakness of not having more objective standards for establishing required levels of evidence for meeting the criteria; and (d) the inability of the method to assess some aspects of noncorrespondence among measures.—*Journal abstract.*

3227. Chakrapani, T. K. (Advertising & Sales Promotion Co., Bombay, India) **On the rationale of the criterion based on binomial distribution.** *Journal of Psychological Researches*, 1969, Vol. 13(1), 59-62.—Questions the assumption of binomial distribution of chance probabilities as a criterion to test the null hypothesis in psychological experiments (such as in a continuous learning situation where the chances of success increase from trial to trial).—*U. Pareek.*

3228. Dudycha, Arthur L. (Purdue U.) **A Monte Carlo evaluation of JAN: A technique for capturing and clustering raters' policies.** *Organizational Behavior & Human Performance*, 1970(Sep), Vol. 5(5), 501-516.—Tested the efficiency of the Judgment Analysis (JAN) technique for grouping raters' strategies according to the similarity of their regression equations under a variety of experimental conditions. 2 groups of 25 hypothetical raters each were simulated, where the n raters in each group all had the same basic strategy (equation) and differed only as a function of a specified random error term in the basic equation. Variables manipulated were: the predictor variance-covariance matrix, the number of stimulus dimensions, the number of stimuli evaluated, the rater predictability, and the degree of strategy similarity between groups. Results show that as cue redundancy increased, it became more difficult for JAN to discriminate properly the members of 1 group from those of the other. The difficulty was somewhat compounded when data were based on fewer than 200 observations, only 5 predictors, and 2 highly similar basic policy groups whose members were rather inconsistent in their profile evaluations. (27 ref.)—*Journal abstract.*

3229. Feldt, Leonard S. (U. Iowa) **A test of the hypothesis that Cronbach's alpha or Kuder-Richardson coefficient twenty is the same for two tests.** *Psychometrika*, 1969(Sep), Vol. 34(3), 363-373.—Derived an approximate statistical test for the hypothesis that the reliability coefficients (L. J. Cronbach's α) associated with 2 measurement procedures are equal. Control of Type 1 error was investigated by comparing empirical sampling distributions of the test statistic with the theoretical model derived for it. The effect of platykurtosis in the test-score distribution on the test statistic was also considered.—*Journal abstract.*

3230. Green, Bert F. (Johns Hopkins U.) **Best linear composites with a specified structure.** *Psychometrika*, 1969(Sep), Vol. 34(3), 301-318.—Derived least squares linear composites of predictors for estimating several

criteria, satisfying the restriction that the composites have an arbitrary specified intercorrelation matrix. These composites were compared with the usual unrestricted regression composites. An illustrative example is provided. The derivation depends on a general result, given in an appendix, about best-fitting orthonormal transformations. (20 ref.)—*Journal abstract.*

3231. Hendel, Darwin D. & Weiss, David J. (U. Minnesota) **Individual inconsistency and reliability of measurement.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 579-593.—The standard error of measurement from group data ignores individual differences in reliability. To assess the prominence of individual factors, 9 groups of undergraduates were administered a 20-statement paired-comparison questionnaire. Groups differed in the test-retest intervals which varied from immediate to 10 mo. Ss were then divided on the basis of internal consistency across the 20 scales. Total circular triads (TCT) were also found. The size of the test-retest coefficients decreased rapidly among low rather than high stable individuals. Within time periods, test-retest coefficients among low TCT individuals tended to be higher than among high TCT Ss. Individual response consistency acts as a moderator variable.—*N. M. Chansky.*

3232. Klahr, David. (U. Chicago) **A Monte Carlo investigation of the statistical significance of Kruskal's nonmetric scaling procedure.** *Psychometrika*, 1969(Sep), Vol. 34(3), 319-330.—Provides estimates of the statistical significance of results yielded by J. B. Kruskal's nonmetric multidimensional scaling. The estimates, obtained from attempts to scale many randomly generated sets of data, reveal the relative frequency with which apparent structure is erroneously found in unstructured data. For 6 or 7 points it is very likely that a good fit will be obtained in 2 or more dimensions when the data are generated by a random process. The estimates presented can be used as a benchmark against which to evaluate the significance of the results obtained from empirically based nonmetric multidimensional scaling.—*Journal abstract.*

3233. McGuire, Timothy W. (Carnegie-Mellon U.) **More on least squares estimation of the transition matrix on a stationary first-order Markov Process from sample proportions data.** *Psychometrika*, 1969(Sep), Vol. 34(3), 335-345.—Derived an efficient generalized least squares estimator which utilizes the entire covariance matrix of the disturbances. This estimator satisfies the condition that each row of the transition matrix must sum to unity. A. Madansky noted that estimates of the variances could be negative and suggested a method for obtaining consistent nonnegative estimates of the variances. The technique was applied to the hypothetical sample data used by G. A. Miller and A. Madansky.—*Journal abstract.*

3234. McQuitty, Louis L. (U. Miami) **Hierarchical classification by multi-level reciprocity.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 227-239.—2 objects are reciprocal if i is highest with j and j is highest with i . This principle of reciprocity is relaxed using 2 methods: successive linkages and core assignments. The redefined concept requires i and j to be reciprocal if i is highest, 2nd, 3rd, or n th with j and j is highest, 2nd, 3rd, or n th with i . Provisions are made for tied classifications, and the concept "misfit" for sets of data whose reciprocities levels are large is introduced. "Results indicate that some previous disagreements in

classification by other methods are attributable to unique characteristics of other methods which force them to make arbitrary decisions based on chance differences in data."—*N. M. Chansky.*

3235. **McQuitty, Louis L.** (U. Miami) **Hierarchical classification by nominee-selectee analysis.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 509-523.—Describes a method which isolates types within a matrix. A pure solution contains submatrices in which no element has a larger rank than the number of elements in its submatrix. When a pure solution does not obtain, a real solution requires the "sum of the average deviation of members from their respective central tendencies" be minimized. The selected solution minimizes the "sum of the average deviation of the 2 submatrices of all possible sizes." Illustrations of solutions are given.—*N. M. Chansky.*

3236. **Miller, Howard L. & Koehler, John.** (U. Alabama) **A negative reaction.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 9-10.—Points out that the psychological terminology describing monotonic curves is ambiguous and inaccurate. An alternative set of terms which accurately describes both the direction of slope and the acceleration is suggested.—*Journal abstract.*

3240. **Ross, John.** (U. Western Australia, Nedlands) **The verbal loop hypothesis: A statistical audit.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 233-235.—T. L. Kelley's formula for the correlation between averages shows that the method used in previous studies to test the verbal-loop hypothesis is almost guaranteed to give an inflated correlation value. It is recommended that methods be used which eliminate the source of inflation.—*Journal abstract.*

3241. **Shaw, David O. & Osburn, H. G.** (Slippery Rock State Coll.) **Comparison of methods for combining incomplete sets of rank-order data.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 526-532.—Explores method accuracy in combining incomplete rankings randomly sampled from various computer-generated populations with known assumptions and parameter settings. Contrary to findings of earlier studies, very significant differences between methods were observed under widely varying conditions. The relationships observed between method performance and experimental variables are shown to be far more complex than previous studies had indicated. Results suggest a decision strategy for the selection of an appropriate method to use with various types of data. (15 ref.)—*Journal abstract.*

3242. **Silverstein, A. B.** (Pacific State Hosp., Pomona, Calif.) **Reliability of a composite in the case of ranked data.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 67-69.—Derives formulas for the reliability of a composite in the case of ranked data, making use of the special formulas for the mean, variance, and correlation coefficient that are available. The formulas derived are identities, differing not in answers they give but in certain statistics which the investigator may prefer to use.—*Journal abstract.*

3243. **Stone, LeRoy A., Coles, Gary J., & Linscheid, Thomas R.** (U. North Dakota) **An estimation of r based on subjective similarity evaluations.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 307-310.—Using linear regression information presented by G. Ekman and his associates, a model which allows the prediction of correlation coefficients (r_p) from similarity estimations (s_p) was devised and used to build a conversion table. An argument favoring possible use of such r_p s was made. The association of s_p to r_p is discussed.—*Journal abstract.*

3244. **Winkler, Robert L.** (Indiana U.) **Intuitive Bayesian point estimation.** *Organizational Behavior & Human Performance*, 1970(Sep), Vol. 5(5), 417-429.—Presents results of an experiment investigating the relationship between intuitive and theoretically optimal Bayesian point estimates for various probability distributions (normal) and loss functions (linear and quadratic). Ss were 47 graduate students in a statistics course which had not yet covered Bayesian inference and decision theory. Results indicate that this relationship depends somewhat on the parameters of the distribution and loss function. Overall, however, Ss performed the task of intuitive estimation and prediction very well. On the average, intuitive estimates were quite close to the optimal estimates despite the complexity of the decision-making problem.—*Journal abstract.*

Factor Analysis

3245. **Bailey, John P. & Guertin, Wilson H.** (U. Florida, Inst. for Development of Human Resources) **Test item dependence of several oblique factor solutions.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 611-619.—Varimax, oblimax, oblimin (biquartimin), binormamin, maxplane, and simple loadings procedures were used to factor analyze 20 of the Twenty-Four Psychological Tests. Each rotation was carried out on 9 variations of strong and weak tests in strong and weak factors. Analysis of variances revealed that rotations were significantly different from one another in factorial stability. Varimax was most stable; oblimin, least stable. The oblimin procedure was least receptive to the battery which included strong tests of the weak factors. (17 ref.)—*N. M. Chansky.*

3246. **Browne, Michael W.** (National Inst. for Personnel Research, Johannesburg, South Africa) **Fitting the factor analysis model.** *Psychometrika*, 1969(Sep), Vol. 34(3), 375-394.—When the covariance matrix $\Sigma(p \times p)$ does not satisfy the formal factor analysis model for m factors, there will be no factor matrix $\Lambda(p \times m)$ such that $T = (\Sigma - \Lambda\Lambda')$ is diagonal. The factor analysis model may then be replaced by a tautology where T is regarded as the covariance matrix of a set of "residual variates," which are linear combinations of "discarded" common factors and unique factors and are correlated. Maximum likelihood, alpha and iterated

principal factor analysis were compared in terms of the manner in which T is defined, a "maximum determinant" derivation for alpha factor analysis being given. Weighted least squares solutions using residual variances and common variances as weights were derived for comparison with the maximum likelihood and alpha solutions. It is shown that the covariance matrix T defined by maximum likelihood factor analysis is Gramian, provided that all diagonal elements are nonnegative. Other methods can define a T which is non-Gramian even when all diagonal elements are nonnegative. (21 ref.)—*Journal abstract*.

3247. Fittkau, Bernd. (U. Hamburg, Psychologische Inst., W. Germany) **Die Mehrdeutigkeit der Varimax-Rotation und einige sich daraus ergebende Folgerungen.** [The ambiguity of varimax-rotation and several resulting conclusions.] *Archiv für die gesamte Psychologie*, 1968(Aug), Vol. 120(1), 106-114.—Demonstrated by an example, that the varimax-rotation of a fixed point-configuration can result in very different varimax-solutions, in case the orthogonal system of reference-axes has been rotated by chance before varimax-rotation. This fact makes a comparison of results in factor-analysis more difficult. It is concluded that in the future it will be necessary in factor-analysis research to rotate by hypotheses. This way is demonstrated by an example and discussed. (French summary)—*English summary*.

COMPUTERS & PROGRAMING

TESTING

3258. Frary, Robert B. & Zimmerman, Donald W. (Regional Education Lab. for the Carolinas & Virginia, Durham, N.C.) **Effect of variation in probability of guessing correctly on reliability of multiple-choice tests.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 595-605.—Illustrates a reliability coefficient formula free of assumptions about the distribution of the probability of guessing correctly when an answer is known. Formulae are presented for the following conditions: probability of guessing varying among choices including the correct answer, probability varying over examinees only, probability varying over items, and probability varying among items and examinees. The average probability of a correct guess is estimable. The attenuating effect of guessing on test validity is discussed. The standard error of measurement is inappropriate with the present formula.—*N. M. Chansky*.

Construction & Validation

3259. Bower, A. C. & Anderson, C. C. (U. Alberta, Edmonton, Canada) **A study of the construct validity of the Conceptual Systems Test.** *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 279-293.—Examined the construct validity of Harvey's content-based Conceptual Systems Test. 540 members of the 4 conceptual systems completed a group of tests predicted to relate differentially to the conceptual groupings. Analyses of variance revealed some theoretically consistent system differences for the variables of internal-external control, religious orientation, naysaying, intro-

version, tender-mindedness, openness to input, and ability. Chi square tests indicate differences among the systems in sex membership, a disproportionately larger number of females appearing in the lowest conceptual system. Findings are related to child rearing practices. (French summary) (24 ref.)—*Journal abstract*.

3260. Tsai, Loh Seng & Newbold, Jeanie. (California State Coll., Fullerton) **Nature, reliability and administration of the Tsai Number-joining Test.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 3-9.—Administered the Tsai Number-joining Test to 481 undergraduates. Product-moment correlations of B-form with a motor, a perceptual, and a coding test were .33, .47, and .58, respectively, indicating that the test involves more central than peripheral functions. Test reliability is evidenced by r of .71 between alternate forms, of .93 between 4- and 6-min segments, and practically identical mean scores for alternate forms. Group testing is just as reliable as individual testing; however, male Ss perform significantly better in a group than when tested individually. (18 ref.)—*Journal abstract*.

EXPERIMENTATION & OBSERVATION

3261. Haber, Ralph N. (U. Rochester) **Note on how to choose a visual noise mask.** *Psychological Bulletin*, 1970(Nov), Vol. 74(5), 373-376.—Presents a methodological plea to investigators of visual masking: Investigators should think carefully about the purposes for which they use a mask, so that they can maximize the selection of an appropriate one and use it in an appropriate design. Several specific rules are offered: (a) to measure the process-stopping potential of a mask, a mask should be chosen that has some chance to interfere with or prevent processing when superimposed over the target; (b) to control the masking effects of poststimulus indicators, adjacency should be avoided as much as possible, or perhaps a different sensory system should be used, and control and base-line data should be collected; and (c) to study the perceptual effects of masking, the S should be asked what he sees, in addition to merely demanding a recognition response or a guess. Other such rules are potentially available, though not elaborated in this brief note. Without care in the selection of masks, and the experimental designs in which they are presented, however, the analysis of perceptual masking effects is far more difficult. (24 ref.)—*Journal abstract*.

3262. Hodos, William. (Walter Reed Army Medical Center, Washington, D.C.) **Nonparametric index of response bias for use in detection and recognition experiments.** *Psychological Bulletin*, 1970(Nov), Vol. 74(5), 351-354.—Describes a simple graphical method for the determination of response bias or criterion in detection and recognition experiments. The method is based only on the geometry of the unit square and makes no assumptions about the statistical properties of sensory events associated with the occurrence of signal and nonsignal conditions. Examples of some applications of this technique are presented.—*Journal abstract*.

Babitskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 295-301.—Describes a stimulator capable of the continuous generation of photic and acoustic impulses in the frequency range of .3-30 cps.—*I. D. London.*

3274. Winfield, A. H. & Jeeves, M. A. (U. Adelaide, South Australia) **The circular maze: An apparatus for studying simultaneous discrimination learning in the rat.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 71-74.—The apparatus is designed to eliminate visual cues—visual extrinsic, visual intrinsic, nonvisual extrinsic, and nonvisual intrinsic—to spatial position. Results from a series of experiments are noted as encouraging.—*Journal abstract.*

EXPERIMENTAL PSYCHOLOGY

3275. Frederickson, Edward W. & Donohue, Robert A. **Auditory and visual tracking of a moving target.**

HumRRO Technical Report, 1970(Mar), No. 70-4, 19 p.—Conducted a test of target tracking accuracy, comparing the auditory and visual tracking performances of 12 22-26 yr. old enlisted men. Aiming and pointing responses were compared for tracking modalities and approaching vs. departing target aspects. Comparison of mean auditory tracking location errors corrected (for acoustic lag) with mean visual tracking location errors showed that the mean auditory errors increased as the target-to-O distance increased, whereas mean visual errors remained constant. When both constant and variable errors were combined into a measure of total human error, the Dispersion Index, total auditory tracking error was greater than total visual tracking error across all treatment conditions. There were no significant differences between mean aiming vs. pointing performances. Direction (incoming vs. outgoing and left-to-right vs. right-to-left) also did not influence tracking accuracy. (22 ref.)—*HumRRO.*

3276. Matheson, Douglas W., Bruce, Richard L., & Beauchamp, Kenneth L. (U. Pacific) **Introduction to experimental psychology.** New York, N.Y.: Holt, Rinehart, & Winston, 1970. xiv, 347 p.

3277. Postman, Leo & Keppel, Geoffrey. (Eds.) (U. California, Berkeley) **Verbal learning and memory: Selected readings.** Baltimore, Md.: Penguin Books, 1969. 501 p. \$2.95(paper).—Contains a collection of papers sampling recent developments in the field of verbal learning and memory by a variety of contributors. Topics covered include acquisition, organization in recall, transfer, short-term memory, interference, and measurement of retention.

PERCEPTION

3278. Baird, John C. (Dartmouth Coll.) **A cognitive theory of psychophysics: I. Information transmission, partitioning, and Weber's law.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(1), 35-46.—Discusses the premise that Ss deal with stimulus information when performing psychophysical judgments. The coding strategy employed to manipulate this information depends upon the particular experimental procedure, which leads to unique psychophysical functions. Different methods impose different memory constraints upon the Ss, thus producing a variety of sensitivity measures for the same stimulus attribute. (30 ref.)—*Journal abstract.*

3279. Brebner, John. (U. Adelaide, South Australia) **Signal discrimination with bisensory presentations.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 59-61.—Previous work has shown that detection of near-threshold signals is improved when simultaneous bisensory presentations of signals are used rather than single presentations. An experiment with 10 male 20-23 yr. old Ss extended this result to discrimination situations, showing that bisensory presentations of the same information improve discriminability and do so even over some situations where a signal is duplicated in the same modality.—*Journal abstract.*

3280. Efron, Robert. (Veterans Administration Hosp., Boston, Mass.) **Effect of stimulus duration on perceptual onset and offset latencies.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 231-234.—Compared the effects of stimulus duration on perceptual onset and offset latency in vision and audition. Ss were 2 adults. It was found that perceptual onset latency was independent of stimulus duration but that the perceptual offset latency was longer for brief stimuli than for stimuli

that exceeded a critical duration. For stimuli longer than the critical duration, the perceptual onset and offset latencies were equal. The same temporal relationships were found in both modalities. Results indicate that for any specific stimulus parameters, reduction of stimulus duration results, ultimately, in a perception of fixed duration.—*Journal abstract.*

3281. Francis, R. D. & Kelly, M. R. (University Coll., Wollongong, New South Wales, Australia) **An investigation of the relationship between word stimuli and optical pupil size.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 117-125.—Investigated pupillary reactions to word stimuli presented both visually and auditorily. 48 undergraduates served as Ss. The ability to discriminate between groups on this basis was explored, together with the relationships between pupil reactivity and neuroticism scores. It was found that: (a) repetition results in diminution of response, (b) choice of words is critical but it does appear possible to discriminate between groups, (c) neuroticism seems to bear some relationship to response manner, and (d) serial order of visual/auditory presentation of stimuli does not appear to affect the direction of the response. (19 ref.)—*Journal abstract.*

3282. Handel, Stephen & Buffardi, Louis. (Kansas State U.) **Pattern perception: Integrating information presented in two modalities.** *Science*, 1968(Nov), Vol. 162(3857), 1026-1028.—Required 54 Ss to organize and identify temporal patterns composed of either (a) 2 stimuli in 1 modality; (b) 2 stimuli in each of 2 modalities, with the pattern alternately presented in the 2 modalities; or (c) 1 stimulus in each of 2 modalities. Patterns a and c are organized as structured patterns, but b is organized by modality, not by pattern structure. When elements of a pattern appear in 2 modalities, the auditory-tactual combination produces the poorest performance.—*Journal abstract.*

3283. Poock, G. K. & Backus, L. A. **Effect of color on apparent speed of a moving object.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 233-234.—Tested 10 members of a highway patrol and 10 military pilots to determine if the color of an object has an effect on the estimated speed of the object. Using red, blue, green, and amber moving lights in a laboratory apparatus, no significant effect was produced by colors nor was there a difference between the 2 groups of Ss.—*Journal abstract.*

3284. Rose, Richard M., Teller, Davida Y., & Rendleman, Paula. (U. Washington) **Statistical properties of staircase estimates.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 199-204.—Studied the bias and variability of staircase estimators by means of repeated computer simulations of staircase runs. Both forced-choice and yes-no staircases were simulated. The influence of the shape of the psychometric function, the location and spacing of the stimuli, the number of trials in a run, and the method of deriving the estimate from the data are discussed. The forced-choice staircase is compared to the yes-no staircase, and the limitations of the simulation procedure are outlined. (21 ref.)—*Journal abstract.*

3285. Stevens, Joseph C. & Cain, William S. (John B. Pierce Foundation Lab., New Haven, Conn.) **Effort in isometric muscular contractions related to force level and duration.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 240-244.—Demonstrates that the degree of perceived force involved in squeezing a handgrip dynamometer grows as a power function of the force of isometric contraction and also as a power

function of the duration of the squeeze. Ss were 18 males. The exponent for force is more than twice that for duration. These 2 power functions can predict measurements of muscle endurance, i.e., of the maximum length of time that contraction of any constant level of force can be sustained.—*Journal abstract.*

Illusion

3286. Andersson, Alf L., Fries, Ingrid, & Smith, Gudmund J. (Lund U., Psychological Lab., Sweden) **Change in afterimage and spiral aftereffect serials due to anxiety caused by subliminal threat.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(1), 7-16.—Experiments with projected negative afterimages and with the aftereffects of a rotating spiral were performed serially (repeated stimulus presentation) employing 76 21-31 yr. old Ss. In the middle of the sequences, experimental Ss were subjected to subliminal threat by means of a metacontrast technique. The effects of threat on the latter part of the sequences were according to predictions and differed markedly from the results in control groups.—*Journal abstract.*

3287. Blakemore, Colin & Sutton, Peter. (U. Cambridge, Physiological Lab., England) **Size adaptation: A new aftereffect.** *Science*, 1969(Oct), Vol. 166(3902), 245-247.—Reports that if after prolonged observation of a striped pattern, a grating of the same orientation with somewhat narrower bars is viewed, then the bars seem even thinner than they are. Broader bars seem broader still. This finding implies a system of size-detecting channels in human vision. The phenomenon may underlie many of the classical figural aftereffects.—*Journal abstract.*

3288. Collins, John K. (Macquarie U., North Ryde, New South Wales, Australia) **The duration of after-effects of seen movement.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 55-57.—Investigated the duration of the aftereffect of seen movement using a sectorized disc, a spiral, and the "waterfall illusion" as stimulus objects. Using 30 undergraduates, the relationships between these stimuli were examined. No significant differences were found in the duration of the respective aftereffects. It is concluded that in future experimentation the spiral should not be used because of the complexity of the aftereffects following stimulation, particularly if objective methods of measurement are to be sought.—*Journal abstract.*

3289. Eriksson, E. Sture. (U. Uppsala, Sweden) **A field theory of visual illusions.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 451-466.—Proposes an outline of a field theory for visual illusions. The main components of the theory are 2 kinds of interaction functions: an attraction function, effective over empty distance, and an attraction-repulsion function, effective within filled distance. The theory is tested in some experiments and is discussed in the context of some well-known illusions. (54 ref.)—*Journal abstract.*

3290. Holt-Hansen, Kristian. (Copenhagen U., Psychological Lab., Denmark) **Perception of a straight line briefly exposed.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 59-69.—Projected a vertical, straight, red line, 17 cm. long and about 2 mm. wide, for 60 msec. onto a medium grey screen 2 m. from S. Ss were 41 adults. Fixating on the nethermost point of the line, S experienced that the line grew from the point of fixation to full length in order and then decreased in length to the point of fixation. The experienced time of lengthening-

shortening, which on an average was about 570 msec. for 37 Ss, was measured by means of a special methodology. At measurable time of lengthening-shortening of Ss' experiences of the line were a regular oscillating phenomenon of perception. A functional relation between the oscillating phenomenon of perception mentioned and the oscillating processes of the brain was sought.—*Journal abstract.*

3291. Leibowitz, H., Brislin, R., Perlmutter, L., & Hennessy, R. (Pennsylvania State U.) **Ponzo perspective illusion as a manifestation of space perception.** *Science*, 1969(Nov), Vol. 166(3909), 1174-1176.—Investigated the observation that the Ponzo perspective illusion is a special case of space perception, and is influenced by contextual factors, texture, stereopsis, and familiarity in addition to perspective cues. 96 American undergraduates and 20 students native to Guam (of the same age and educational level, but who had spent their entire lives on the island) took part in a 3-part study. Empirical evidence in support of the observation is presented, including the importance of familiarity, which was demonstrated by cultural differences obtained with photographs of natural settings which emphasize depth cues.—*Journal abstract.*

3292. Over, Ray. (Dalhousie U., Halifax, Nova Scotia, Canada) **The effect of instructions on visual and haptic judgment of the Müller-Lyer illusion.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 161-164.—In an experiment with the Müller-Lyer figure, instructions to 48 undergraduates to judge apparent size-equality resulted in a larger visual illusion than instructions to judge objective size-equality. The 2 sets of instructions did not, however, have a differential effect on the amount of haptic illusion. 1 reason for this difference may be that visual inspection permitted S to perceive the illusion figure in relation to its background while haptic inspection did not. Data may also reflect differences in the way spatial information is sampled within the 2 modalities. Haptic inspection entails widespread sampling from the figure under both instruction conditions. With visual inspection it is possible that widespread sampling occurs with 1 set of instructions only.—*Journal abstract.*

3293. Power, R. P. (Queen's U., Belfast, Ireland) **Interaction between treatments and order of treatments in studies of the apparent reversal of rotary motion in depth.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 35-40.—In many experiments concerned with the apparent reversal of rotary motion in depth (AR) the same Ss have been used under a number of conditions, but there has been no attempt to establish whether there is interaction between type of stimulus object and order of presentation. 2 experiments with 20 undergraduates each were carried out, and since a significant interaction occurred in 1 experiment it is concluded that independent groups of Ss should be used in experiments on AR, and that the results of experiments where no such test has been made should be interpreted with caution. It is also claimed that in any experiment in which Ss are used under more than 1 condition it should be established whether or not such interaction occurs. (17 ref.)—*Journal abstract.*

3294. Thorson, John; Lange, G. David, & Biederman-Thorson, Marguerite. (U. California, Medical School, San Diego) **Objective measure of the dynamics of a visual movement illusion.** *Science*, 1969(May), Vol. 164(3883), 1087-1088.—Apparent movement in periph-

eral vision can be induced by sequential flashing of 2 dots that are spatially unresolved. Ss used this illusion to make forced-choice estimates of the directional sequence of the dots. Performance at this task defines spatio-temporal conditions that induce the illusion without reliance upon subjective distinctions of movement from successivity and simultaneity. The dynamics of the illusion, defined in this way, are measured and compared with those for after-flash inhibition and the perception of real movement.—*Journal abstract.*

Time

3295. McConchie, Richard D. & Rutschmann, Jacques. (New York State Psychiatric Inst., New York) **Reliability of time estimation: Effect of a preceding reproduction series on the reliability of subsequent verbal estimates of the same standard stimuli.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 51-55.—32 male undergraduates, 16 in an experimental group and 16 in a control group, gave 2 verbal estimates of each of 8 standard intervals ranging from 300-1000 msec. in 100-msec steps. The experimental group reproduced each standard 12 times before verbally estimating it, while the control group had no prior experience with the standards to be verbally estimated. The mean reliability of the verbal estimates of the experimental group was significantly higher ($p < .02$) than that of the control group. This finding was held to account for the high reliability coefficients reported for the method of verbal estimation by a number of comparative studies employing several methods on the same group of Ss. The result suggests that serial position of the measuring methods may spuriously inflate the reliability coefficients of the method of verbal estimation when that method is used subsequent to the method of reproduction.—*Journal abstract.*

3296. Svenson, Ola. (U. Stockholm, Psychological Lab., Sweden) **A functional measurement approach to intuitive estimation as exemplified by estimated time savings.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 204-210.—Ratings of time savings when increasing an original assumed mean speed to a higher one were collected for different distances and combinations of velocities in 2 experiments. 24 and 35 undergraduates, respectively, served as Ss. The spontaneous process leading to estimate formation was accounted for by a multiplicative combination of 2 components, 1 related to physical distance and the other proportional to the difference in speeds divided by the larger speed. This use of the information of velocities leads to systematic discrepancies between predicted and real-time gains.—*Journal abstract.*

3297. Yoblick, Darryl A. & Salvendy, Gavriel. (State U. New York, Buffalo) **Influence of frequency on the estimation of time for auditory, visual, and tactile modalities: The kappa effect.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 157-164.—Tested the hypothesis that a spatial component of frequency, wavelength, has a direct effect on the subjective estimation of filled time intervals on 40 undergraduates. Combinations of pairs of auditory tones, visual flicker, and tactile vibrations with 3 stimulus intensities, and 7 levels of disparity within each pair of stimuli were studied. The Ss estimated by reproduction whichever frequency in the pair seemed to last longer. Results, which support the hypothesis only for auditory tones,

indicate Ss overestimate the duration of the lower of 2 frequencies significantly more than the higher, and their overestimates increase with increasing disparity between frequencies.—*Journal abstract.*

VISION

3298. Bauer, Robert W. & Florip, David J. **Night vision with a binocular system.** *U.S. Army Human Engineering Laboratories Technical Note*, 1969(Aug), No. 3-69, 11 p.—Observed recovery of dark adapted acuity after the use of a night vision system in 2 experiments within a flight simulation facility. The users of these 2 systems gave up about 1 log cycle in dark adaptation (luminance required) to gain about 1 log cycle in viewing objects 5-10 min. or larger. 100% recovery of rod dark adaptation required from 3-4.2 min. Because of their target brightness sensitivity, color characteristics and acuity ranges, these systems can be appropriately compared with human unaided dark adapted rod vision.—*Journal abstract.*

3299. Eriksen, Charles W., Becker, Barbara B., & Hoffman, James E. (U. Illinois) **Safari to masking land: A hunt for the elusive U.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 245-250.—Due to the theoretical interest in whether U-shaped visual masking functions are obtained when discrimination responses are required of the Ss, an attempt was made to replicate the N. Weisstein and R. N. Haber (see PA, Vol. 39:6538) experiment using 4 adult Ss. The attempt was unsuccessful. Results indicate that masking was uniform over a temporal range of approximately 50 msec. The possibility of individual differences in the shape of masking functions was investigated in 2 subsequent experiments with 4 and 3 undergraduates, respectively, with negative results. Overall, results of the 3 experiments support a temporal integration account of masking when assessed by detection or discrimination criteria. Some possible reasons for discrepancies with the Weisstein and Haber experiment are considered. (24 ref.)—*Journal abstract.*

3300. Gregg, J. R. (Coll. of Optometry, Los Angeles, Calif.) **Opyty so zreniem v shkole i doma.** [Vision experiments for home and school.] Moscow, USSR: Mir, 1970. 199 p. 45 K.

3301. Mauney, Malvin C. & Porter, Vonne F. (Southern Coll. of Optometry) **A comparison of optometric findings taken in refracting rooms of different shapes.** *Journal of the American Optometric Association*, 1969(Jun), Vol. 40(6), 607-609.—Studied the clinical feasibility of using wedge-shaped booths for refraction tests in place of the typical rectangular booth. 36 Ss were given 2 visual examinations each, 1/2 being examined 1st in the wedge-shaped booth. 21 components of the visual examination were obtained under both room conditions. Results show that the wedge-shaped booth can be as useful as the rectangular booth for reliable refraction tests, and has the advantage of occupying less floor space.—*P. McMillan.*

3302. Putz, Vernon R. (Wisconsin State U.) **Dynamic visuometric techniques.** *Behavior Research Methods & Instrumentation*, 1970(Sep), Vol. 2(5), 240-244.—Describes a general technique to automate the measurement of visual thresholds. The method is based on the dynamic analog of the method of adjustment, incorporating continuous feedback. Threshold is treated as a system interaction between some level of response and

sensed input. The S tracks a stimulus that continually oscillates in magnitude around threshold. The accuracy and variability of the S's response provides a dynamic and functional assessment of the threshold under the condition of the experiment. Techniques for instrumenting several visuometric procedures are described.—*Journal abstract.*

3303. Wallace, G. & Worthington, A. G. (Monash U., Clayton, Victoria, Australia) **The dark adaptation index of perceptual defence: A procedural improvement.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 41-46.—A. G. Worthington (see PA, Vol. 39:6493) has reported a study which employed rate of dark adaptation as an index of perceptual defense. Recently D. J. Weintraub and D. H. Krantz (see PA, Vol. 42:8166) reported a replication study which failed to reproduce the original findings. It can be argued that this was not a true replication, however, the reliability of the original findings and the potential usefulness of the procedure were placed in doubt. An attempt was made to improve the procedure originally utilized and to evaluate the consistency of the effect. The most significant improvement in technique concerned the use of 1 test stimulus throughout the entire procedure and the use of improved measurement techniques. Results strongly support Worthington's original interpretation that, using appropriate methodology, it is possible to demonstrate the existence of a perceptual component in perceptual defense.—*Journal abstract.*

Perception

3304. Chitayat, Deanna G. (New School for Social Research) **Differential perceptual adaptation to opposite rotations of the visual field.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 409.

3305. Fisher, Cletus G. (U. Iowa) **Confusions among visually perceived consonants.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 796-804.—18 undergraduates with normal hearing responded to the visual perception of initial and final consonants in an English-like phonetic environment in a test of the homophony of consonant sounds of English. The Multiple-choice Intelligibility Test provided stimulus items but special response sheets were provided to allow each S a possible response of any consonant judged homotypical or homorganic to the stimulus item. Correct answers as possible responses were deleted to provide a usable number of confusions. Ss were not aware of the deletion of correct responses even after the task was completed. Resulting confusion matrices were analyzed for significant confusions among consonants; these confusions were grouped into mutually exclusive classes termed visemes. Results support previously published linguistic groupings of homophenous sounds rather than the classical listing from the developers of speechreading methodology. Variations from the former are explained in terms of the addition of minimal phonetic redundancy.—*Journal abstract.*

3306. Forster, Kenneth I. (Monash U., Clayton, Victoria, Australia) **Visual perception of rapidly presented word sequences of varying complexity.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 215-221.—Describes 4 experiments that determine whether or not syntactic complexity affects the visual perception of rapidly presented word sequences. Results from 50 undergraduates indicate that sentences containing only 1

sentence in the underlying structure are more accurately reported than sentences containing 2 underlying sentences. It is shown that this result is not due solely to distortion of the input, but is likely to reflect the rate at which structural representations of the input can be developed. (19 ref.)—*Journal abstract.*

3307. Gilbert, A. J. (Western Australia Inst. of Technology, South Bentley) **Set and visual perception.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 155-160.—Studies into the influence of set on perception have produced conflicting evidence. It is suggested that experimental results have been confounded by factors, i.e., the number of task instructions and stimulus objects presented for each trial, and whether primary or secondary stimulus attributes have been employed. Results from 80 undergraduates indicate that the principal effect of task instructions was to energize associated schema. This effect influenced perception by tending to determine which schema were involved in the development of percepts. Responses were separately influenced through set-relevant responses being made more readily available.—*Journal abstract.*

3308 Gillam, Barbara. (U. Copenhagen, Denmark) **Judgments of slant on the basis of foreshortening.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(1), 31-34. By analogy with B. K. Stavrianos' finding for linear perspective, it was proposed that the effectiveness of foreshortening as a slant cue would increase as a function of visual angle. Surfaces of vertical lines slanted around a vertical axis were monocularly viewed by 12 undergraduates at 3 horizontal visual angles and 4 angles of slant. An adjustment method was used to record apparent slant. An analysis of variance showed significant F ratios for visual angle and angle of slant, supporting the hypothesis that increasing visual angle increases the effectiveness of slant judgments. However, Ss' verbal reports indicate that slant may not be perceived when only foreshortening is available as a cue.—*Journal abstract.*

3309. Grauer, Robert A. & Dunn, Bruce E. (U. Calgary, Ontario, Canada) **Enhanced flicker discrimination during stimulation by pulsed tones.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 218.—Stimulated 84 Ss by tones that varied in frequency and pulse rate. It was observed that Ss were better able to discriminate flicker during stimulation by pulsed tones than by steady tones. There was no significant effect of tone frequency. Previous experiments had shown that CFF was higher under conditions of steady tone stimulation than in quiet conditions.—*Author abstract.*

3310. Greenberg, Herbert J. & Bode, Daniel L. (Purdue U.) **Visual discrimination of consonants.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 869-874.—Determined consonant differentiation by speechreading for full-face and lips-only exposures utilizing 2 forms of a closed-set response test. 32 female undergraduates viewed a videotaped recording of a male talker under the 2 exposure conditions. Consonant discrimination was more accurate when Ss viewed the talker's entire face than when they viewed only his lips. The 2 test forms were not equivalent in visual intelligibility and initial consonants were more accurately discriminated visually than final consonants. These factors should be considered in research or diagnostic use of CVC monosyllables in the measurement of visual consonant discrimination.—*Journal abstract.*

3311. Harcum, E. Rae. (Coll. of William & Mary)

Defining shape for perceptual element-position curves. *Psychological Bulletin*, 1970(Nov), Vol. 74(5), 362-372.—Attempts to resolve the controversy between M. Glanzner (see PA, Vol. 42:13029) and E. R. Harcum (see PA, Vol. 42:13030) about whether the perceptual serial-position curve should be described in absolute or relative terms, particularly with reference to the degree of asymmetry. 4 measures of asymmetry are discussed: (a) absolute differences in errors between elements on the left vs. right of center; (b) left-right differences weighted according to totals of errors; (c) relative frequencies of Ss showing superior perception for a given $\frac{1}{2}$ of the pattern; and (d) rank order of elements according to relative accuracy. The superiority of the conception in relative terms is established primarily through interpretation of empirical results. It is concluded that a fine-grained analysis of individual differences in perceptual strategy, using all available measures for shape of error distributions, should be applied to the theoretical issues in this area. (53 ref.)—*Journal abstract.*

3312. Kleiven, Jo & Rommetveit, Ragnar. (U. Oslo, Inst. of Psychology, Norway) **Meaning and frequency in a binocular rivalry situation.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(1), 17-20.—When a word perception task was studied with 24 undergraduates under conditions of binocular rivalry, the meaningful 1 of 2 rivaling strings of letters was identified more often than the other. Differences in frequency of the trigrams in the Norwegian language had no effect.—*Journal abstract.*

3313. Lester, Gene. (State University Coll. New York, Buffalo) **Haidinger's brushes and the perception of polarization: The history to the present of an on-going problem.** *Acta Psychologica, Amsterdam*, 1970(Sep), Vol. 34(1), 106-114.—*Journal abstract.*

3314. McKeever, Walter F. & Huling, Maurice D. (Ventura County Mental Health Dept., Calif.) **Right hemispheric superiority in graphic reproduction of briefly viewed dot figures.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 201-202.—20 undergraduates drew dotted and solid-lined designs following standard brief exposures. The designs were presented equally often in the left and right visual half-fields. Drawing accuracy was unrelated to field of presentation for solid-lined designs, but dotted designs were significantly more accurate when drawn following left field presentation. The result is consistent with previous reports of right hemisphere superiority in dot perception.—*Journal abstract.*

3315. Murch, Gerald M. (Portland State U.) **The perception of rotary motion.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 83-85.—Extends R. P. Power's (see PA, Vol. 41:6543) analysis of the cues of rotary motion for rectangular figures subtending small visual angles. Results indicate that the perception of rotational direction evolves from size and perspective cues provided by the orderly transformation of the ambient array projected by the moving target.—*Journal abstract.*

3316. Naylor, G. F. (U. Queensland, St. Lucia, Australia) **Perception times and rates as a function of the qualitative and quantitative structure of the stimulus.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 165-172.—Tested 42 undergraduates with 5 series of stimulus material each containing a quantitative range of material with increasing complexity of structure from series to series. It was found that the absolute

perception time for the single units of these series did not differ greatly, but that the relative times for perceiving more than 1 unit presented simultaneously increased in accordance with increased content and with complexity of content. Rates of perception increased to a maximum corresponding to an optimal quantum of simultaneously presented material, and then decreased when the amount presented was further increased.—*Journal abstract.*

3317. Nilsson, Thomy H. (U. Alberta, Edmonton, Canada) **Two-pulse-interval vision thresholds.** *Journal of the Optical Society of America*, 1969(Jun), Vol. 59(6), 753-756.—Presents data on visual discrimination of 2-pulse-interval differences. 8 faculty members and graduate students served as Os. Exp. I measured difference thresholds for pulse intervals from 0-75 msec.; luminance being varied from 50-2000 ml. Luminance had no significant effect on these temporal discriminations. Difference thresholds decreased linearly as pulse interval increased. Exp. II measured increment and decrement difference thresholds separately, for pulse intervals from 0-90 msec.: Increment thresholds decreased as pulse interval increased from 0-30 msec., but increased as pulse interval was increased beyond 30 msec. Although the shape of the decrement-threshold function was not defined, increment- and decrement-threshold functions differed markedly. These discrimination functions are thought to result from the temporal-response characteristics of definite visual processes. (15 ref.)—*Journal abstract.*

3318. Quinlan, Donald. (Yale U.) **Effects of sight of the body and active locomotion in perceptual adaptation.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 91-96.—Studied the influence of sight of the body and active locomotion on perceptual adaptation to tilted vision in 60 male undergraduates. Sight of all, a part, or none of the body was examined under conditions of both active and passive locomotion. Judgments of apparent vertical (AV) and apparent body position (ABP) were obtained after 20 min. of tilted vision. Active Ss showed more adaptation than passive Ss in the combined AV and ABP judgments, and Ss with sight of their own bodies showed more adaptation than Ss viewing only objects in the environment. AV and ABP did not differ significantly, although there was a tendency for the ABP judgment to show more adaptation in the active body-viewing conditions. Findings are consistent with the reafference hypothesis of R. Held and his colleagues, and suggest that there are 2 additive components of adaptation, which could be described as head-trunk orientation and eye-head orientation.—*Journal abstract.*

3319. Reilly, Thomas. (U. Kansas) **Some normative data for the spiral aftereffect.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 211-217.—Exposed 67 undergraduates to the spiral aftereffect (SAE) in varied combinations of stimulation time and direction of rotation to observe the frequency and duration of SAE for a normal population. It was noted that: (a) men report slightly more AEs than women, (b) more men than women always report an AE, (c) AE reports increase with longer inspection times, (d) expansion AEs occur more often and last longer than contraction AEs, (e) reversal stimulation yields fewer AE reports of shorter duration and has a greater effect on contraction AE than expansion AE, and (f) the relation between stimulation time and AE duration is not linear. (18 ref.)—*Journal abstract.*

3320. Simondon, G. **La perception de longue durée: II. Analyse de la rotation d'une surface vue en projection.** [Long duration perception: II. Analysis of the rotation of a surface seen in projection.] *Journal de Psychologie Normale et Pathologique*, 1970(Apr), Vol. 67(2), 153-170.—Drawings of various types of objects were projected on a screen at a distance of 500 mm. The most constant effect was globalization, in which: (a) a solid surface is seen as partially translucent; (b) a textured surface is seen as animated; and (c) plane surfaces, when textured, may be perceived as alternatively undulating, while the textured surface appears in relief.—L. A. Ostlund.

3321. Smith, Karl U., Putz, Vernon, & Molitor, Killian. (U. Wisconsin, Behavioral Cybernetics Lab.) **Delayed retinal feedback of eye movements: A dynamic basis of perceptual disabilities.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 538-548.—Investigated temporal factors in vision in relation to the delay of the retinal feedback of ocular movements in eye tracking. A hybrid real-time computer system and dynamic programming methods were used to calibrate photoelectric eye-movement transducers in viewing visual targets, to yoke these targets to eye motion, to introduce feedback delays in eye-movement-retinal interaction, and to measure error in eye tracking. Results indicate that feedback delay affected the accuracy of both the compensatory and the pursuit tracking in a significant way, with a somewhat greater effect being found for pursuit movements. Since delay reduced smooth pursuit motions to saccadic reactions that varied in size with the delay interval, it is suggested that ocular dynamics and guidance in space perception are governed by time-specific neuron mechanisms of the central visual system. Findings negate classical theory of ocular dynamics and perception of direction by proving that directional guidance of the eyes is determined by directional specificity and temporal specificity of the feedback processes of pursuit and saccadic movements of the eyes and is not caused primarily by learned temporal association between visual and tactual sensory processes. It is concluded that major disabilities and distortions in vision, which are not reducible to traditionally defined optometric and ophthalmologic factors, may be produced by built-in developmental perturbations of ocular feedback timing. Findings emphasize dynamic optometric measurements in understanding common and elusive distortions of visual perception. (19 ref.)—*Journal abstract.*

3322. Smith, Nathaniel C. (Ohio State U.) **Recognition thresholds for digits.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 11-15.—Studied the role of form and size upon the recognition thresholds for digits using the Weiss focal variator and Century Old Style Bold digits. Ss were 5 young adults. Individual differences were so large as to make any generalization impossible; halving and doubling the standard produced a significant and differential effect upon the recognition thresholds. The question of the role of form in the determination of recognition threshold, the concept of response probability, and the applicability of the Tanner-Swets model to this type of data is raised.—*Journal abstract.*

Size & Distance & Depth Perception

3324. Crannell, C. W. & Peters, Gregory. (Miami U.) **Monocular and binocular estimations of distance when knowledge of the relevant space is absent.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 157-167.—In 3 experiments undergraduates reported the distance of an illuminated target shown in total darkness. Monocular and binocular observations both produced the same results: very poor depth perception which became wholly negligible when the targets were equated for size and brightness at the eye. In 2 additional experiments Ss reported the nearest and farthest targets among simultaneously presented groups of 2 to 6 targets. Binocular vision, in this case with disparity present, was consistently superior to monocular vision, which tended to yield results less than chance, a phenomenon termed the "Bappert effect." It is concluded that accommodation and convergence do not serve as cues for depth.—*Author abstract*.

3325. Gardner, Riley W. (Menninger Foundation, Topeka, Kan.) **Scored for the cognitive control of extensiveness of scanning.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 330.—Presents reasons for using direct measures of scanning behavior, rather than constant error, to represent the cognitive control of extensiveness of scanning in response to size-estimation tests.—*Author abstract*.

3326. Hershberger, Wayne & Urban, Daniel. (Northwestern Illinois U.) **Depth perception from motion parallax in one-dimensional polar projections: Projection versus viewing distance.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 133-136.—36 undergraduates viewed each of 3 polar projections of a 22.9 cm long dotted line rotating in depth about its center. The 3 projections differed in the distance of the projection point employed: either 30.5, 61, or 121.9 cm. from the coincident axis of rotation and projection plane. The veridicality of Os' judgments of direction of rotation varied as an inverse function of projection distance and was unaffected by viewing distance.—*Journal abstract*.

3328. Rawlings, Samuel C. & Shipley, T. (U. Miami) **Stereoscopic acuity and horizontal angular distance from fixation.** *Journal of the Optical Society of America*, 1969(Aug), Vol. 59(8), 991-993.—Measured the threshold of stereopsis (mean deviation in sec. of arc) of 3 Os at 2° intervals from 8° right to 8° left in the horizontal meridian of the binocular field. A simple 2-point target, along with a binocular fixation point, was presented by use of a mirror haploscope. Disparity was introduced by varying the separation of the 2 peripheral points in 1 eye. Judgments of the relative depth of the 2 binocular peripheral points, were based on these disparity cues. Data show a decrease of stereoscopic acuity as a function of horizontal offset. There is a slight discontinuity in the curve, near 4-6°, which may correspond to a rod-cone density change.—*Journal abstract*.

3329. Thor, Donald H., Winters, John J., & Hoats, David L. (Edward R. Johnstone Training & Research Center, Bordentown, N.J.) **Eye elevation and visual space in monocular regard.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 246-249.—80 junior high school students made monocular comparisons of

standard and variable apertures through collimating lenses in a dark room. Placement of paired targets was varied in a vertical arc with 10 combinations of elevations at 10, 30, 50, and 90° to the horizontal. When the standard was the lower target, size and distance discriminations were both distorted ($p < .001$) in a comparable illusory direction (lower target seen as larger and nearer). No illusion was obtained for size or distance discriminations when the standard target was in the upper position.—*Journal abstract*.

3330. von Wright, J. M. & Kekkinen, Raili. (U. Turku, Finland) **Stimulus range and the estimated ratio between two stimuli.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 294.—The estimated ratio between 2 given circular areas presented to 63 Ss was found to decrease with an increase in the size-range of a set of circular areas presented in an immediately preceding experiment which involved pair comparison of circles with respect to pleasantness.—*Author abstract*.

Bristol, England) **Confrontation of the H-V illusion and a test of 3-dimensional pictorial perception in Nigeria.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 105-106.—2 tests previously used separately in investigating Africans' cognitive skills both imply that they examine ways in which Ss infer 3-dimensional properties from (2-dimensional) lines on paper. These tests were given to 2 separate samples of 173 and 50 Nigerian adults, yielding 0 correlations.—*Journal abstract*.

Color Vision

3332. Chickering, K. D. (Kollmorgen Corp., Holyoke, Mass.) **Perceptual significance of the differences between CIE tristimulus values.** *Journal of the Optical Society of America*, 1969(Aug), Vol. 59(8), 986-990.—The chromatic difference given by the Fricke, MacAdam, Chickering (FMC) color-difference formula is separated into yellow-blue and red-green chromatic differences. The rates of change of lightness and chromatic differences with change of CIE tristimulus value differences are then calculated. Results, 9 partial derivatives, are plotted on 1931 CIE chromaticity diagrams. The red-green chromatic difference is most sensitive; variations less than .22 (out of 98) of ΔX , anywhere in color space, are sufficient to cause a perceptual change of at least 1 MacAdam unit. For many colors of practical interest a .02 variation causes a 1 MacAdam unit change, a fact which should concern instrument manufacturer, instrument user, and tolerance setter alike. (19 ref.)—*Journal abstract*.

3333. Fidell, L. S. (San Fernando Valley State Coll.) **Orientation specificity in chromatic adaptation of human "edge-detectors."** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 235-237.—The McCollough effect, a pattern-specific complementary hue aftereffect, has usually been demonstrated with horizontal and vertical adapting and test patterns. In a study with 35 undergraduates, the strength of the effect produced by adapting patterns of various angular separations was measured. The effect decreased with decreasing angular separations until it was minimal at 11° of separation. Results are considered to be consistent with an edge-detector interpretation of this aftereffect. With vertical and horizontal adapting patterns, the reddish aftereffect was 17% and the greenish aftereffect 9% of colorimetric purity.—*Journal abstract*.

3334. Harris, Charles S. & Gibson, Alan R. (Bell Telephone Lab., Murray Hill, N.J.) **Is orientation-specific color adaptation in human vision due to edge detectors, afterimages, or "dipoles?"** *Science*, 1968(Dec), Vol. 162(3861), 1506-1507.—Conducted an experiment with 24 Ss to test the McCollough effect, which states that after an S looks alternately at red vertical and green horizontal stripes, vertical and horizontal white stripes appear greenish and pink, respectively. Results indicate that most Ss saw a McCollough aftereffect. This aftereffect might imply that contour-detecting cells participate in human vision, or might simply be due to afterimages. A procedure that precludes afterimages still yields aftereffects, but sensory units less complex than edge detectors could be responsible.—*Journal abstract*.

3335. Pearson, D. E., Rubinstein, C. B., & Spivack, G. J. (Bell Telephone Lab., Inc., Holmdel, N.J.) **Comparison of perceived color in two primary computer-generated artificial images with predictions based on the Helson-Judd formulation.** *Journal of the Optical Society of America*, 1969(May), Vol. 59(5), 644-658.—Tests the accuracy of the H. Helson and D. B. Judd formulation in predicting the perceived color of objects in 2-primary projections. 5 trained Ss gave color-naming responses for hue, lightness, and saturation of perceived color in computer-generated artificial images viewed in red and white projection. The averaged results indicate predictions that are 90% correct for hue, 81% for lightness and 61% for saturation at mesopic luminance levels, and 83% correct for hue, 67% for lightness, and 78% for saturation at photopic luminance levels.—*Journal abstract*.

3336. van der Horst, Gerard J. (Physics Lab., Utrecht, Netherlands) **Fourier analysis and color discrimination.** *Journal of the Optical Society of America*, 1969(Dec), Vol. 59(12), 1670-1676.—Measured the contrast thresholds of equiluminous chromaticity-modulated gratings for various waveforms. It was expected that only the fundamental Fourier component is of significance in the threshold visibility of colored gratings. In addition, the Fourier transformation is applied to the chromatic spatial-sensitivity curves. The transformed functions illustrate the spatial organization of the contrast mechanisms. For 160 trolands, the summation area of the red-green chromatic activity extends over 10° , whereas the yellow-blue activity integrates over about 25° . A comparison of the Fourier transforms of a luminance- and chromatic-threshold contrast curve shows: (a) inhibitory qualities, and (b) the greater spatial sensitivity of the luminous function. The assumption is made that the visual resolution for differences of brightness, and chromaticity, is limited by the diffraction of light by the pupil. The visual acuity for differences of hue as a function of the background wavelength is predicted for a 30-compound grating and compared with an empirical function. There is good agreement.—*Journal abstract*.

3337. Weitzman, Donald O. & Kinney, Jo A. (Naval Submarine Medical Center, Groton, Conn.) **Effect of stimulus size, duration, and retinal location upon the appearance of color.** *Journal of the Optical Society of America*, 1969(May), Vol. 59(5), 640-643.—The names given to spectral stimuli from 480-610 m μ and to a white-light test stimulus were obtained using 11' or 21' diameter stimulus fields, exposed for 20 msec. in the fovea and for 20 and 200 msec. at 5° and 10° in the periphery. The hypothesis that normal color vision is

replaced by tritanopic vision in all parts of the retina if the total luminous energy is sufficiently reduced was tested. Results obtained with 4 Os confirm the presence of tritanopia when small brief stimuli are viewed foveally but fail to confirm it in the periphery. Rather, reduced color vision in the periphery is more nearly characteristic of deuteranomaly which results in colorless vision. Results support the notion that foveal tritanopia is due to the depressed sensitivity of the blue receptor mechanism found in the central fovea. (25 ref.)—*Journal abstract*.

Form & Pattern Discrimination

3338. ———. **Periodic psychophysics.** *Nature* (Oct), Vol. 224(5217), 311.—Campbell and colleagues have applied the Fourier theory to the visual system. "In outline, their method has been to produce gratings in which brightness varies sinusoidally in one direction. A spatial pattern varying sinusoidally in the horizontal direction... has the appearance of equally spaced vertical stripes with soft blurred edges. When described in the spatial frequency domain this is a very simple stimulus." The visual system confronted by such a pattern responds differentially and a frequency response curve, known as the contrast sensitivity function, can be plotted linearly. Experimental determination of contrast sensitivity functions corresponded to "linear theory particularly for frequencies greater than 10 cycles/degree. While not implying that the brain does a Fourier analysis of visual patterns, these results indicate that at near threshold levels, spatial information is transmitted without distortion and that Fourier methods provide an appropriate mathematical representation of the visual system."—B. A. Stanton.

3339. Bersted, Chris T., Brown, Bill R., & Evans, Selby H. **Schema learning and utilization as a function of task and stimulus variables.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1969(Dec), No. 22-69, 21 p.—Evaluated the effects of constraint redundancy shifts, length of rest interval and duration of intertask interval on the acquisition and transfer of schematic concepts. Exp. I with 81 undergraduates indicated that increasing the magnitude of stimulus redundancy in a simple discrimination task facilitates schematic concept formation (SCF), but that the redundancy variable interacts with length of the rest interval administered prior to the redundancy shift. Transfer of SCF from a discrimination task to a modified reproduction task following a variable intertask interval was demonstrated in Exp. II with 72 Ss. This demonstration, however, required the use of an extremely sensitive dependent measure. Results complement each other in that they indicate hypothesis shifting by Ss, rather than fatigue or boredom, to be the primary basis for both the variable performance and the small positive transfer in SCF tasks. (15 ref.)—*Journal abstract*.

3340. Brebner, John; Brooks, Harry, & Gellatly, Angus. (U. Adelaide, South Australia) **Signal discrimination with multiple inputs.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 63-66.—Demonstrated that discrimination among randomized dot patterns which varied in the number of dots used is better with duplicated than with single presentations. 36 undergraduates served as Ss. This finding is in line with previous work using unisensory and bisensory multiple inputs. The experiment also shows that where Ss make successive judgments of the same display, and these

judgments conflict with one another, 1 being correct and the other wrong, this conflict is resolved with a better than chance likelihood of being correct. It was also shown that Ss' confidence in amended judgments is lower than in repeated judgments. The tendency to guess correctly between conflicting judgments, may be the basis for the improvement in detection and discrimination performance previously observed with multiple inputs.—*Journal abstract.*

3341. Krueger, Lester E. (City Coll., City U. New York) **Apparent combined length of two-line and four-line sets.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 210-214. —Recent studies, using single-line stimuli, show apparent length to be a power function, with exponent 1, of objective or physical length. If apparent lengths are additive, then, given the 1 exponent, 2 lines should appear to S to have the same total length as the single line they would form if physically joined. Ss were 70 undergraduates. When S adjusted the length of 1 line to match the combined length of 2 other lines, however, the variable line was generally made much longer than the actual combined length of the 2 lines. Dividing the total length equally between the 2 lines, so that each had 50%, represents the greatest departure from a single line, yet the largest overestimation occurred when 1 of the 2 lines had 65-75% of the total length. The overestimation was greater when the lines were spaced farther apart, suggesting that the amount of area occupied by the lines affects apparent combined length. (19 ref.)—*Journal abstract.*

3342. Menzer, George W. & Thurmond, John B. (U. Louisville) **Form identification in peripheral vision.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 205-209. —Employed outlined and solid-surfaced metric histoforms and polygons in an identification task with 120 undergraduates where choice forms were fixed at 0° and target forms at 6 points along the temporal horizontal meridian in the periphery (nasal retina). Accuracy in the identification of solid-surfaced polygons in the far periphery (80° from the fovea) was much higher than has been previously reported. Polygons were identified more quickly than histoforms, but a significant difference was not obtained between the speed of identification of outlined and solid shapes. Combined speed and error data indicate that shape (histoform or polygon) is the most salient dimension of a form less than 50° from the fovea, whereas beyond 50° from the fovea the surface (outlined or solid) of a form is its most salient dimension. Finally, comparisons of the functional relations provided by these performance data with anatomical and physiological data produced the hypothesis that spatial summation of rod receptors beyond 20° of angular eccentricity in the nasal retina is directly proportional to the density of rod receptors. (21 ref.)—*Journal abstract.*

3343. Plumb, Clifford C. (Indiana U.) **The effect of structural depth cues on delayed recognition responses and evaluative ratings of visual displays.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 420-421.

3344. Preusser, David; Garner, W. R., & Gottwald, Richard L. (Yale U.) **Perceptual organization of two-element temporal patterns as a function of their component one-element patterns.** *American Journal of Psychology*, 1970(Jun), Vol. 83(2), 151-170. —20 undergraduates observed and described continuously repeated 2-element temporal patterns and their component 1-

element patterns. Descriptions could begin at any event in a pattern. Descriptions of 1-element patterns revealed 2 organizing principles: preference for longest gap at the end, or longest run of positive events at the beginning. Variability of pattern organization was low when in a particular pattern these 2 principles were compatible or when the principles were incompatible but with the gap principle stronger, and increased when the 2 principles were incompatible and equally strong or the run principle was stronger. The descriptions of 2-element patterns showed that 1 element emerged as figure and the organizing principles for that element determined the perceived organization for the 2-element pattern. It is concluded that variability and difficulty of 2-element perceptual organization is a function both of figure-ground relations between the 2 elements and of compatibility of 1-element organizing principles.—*Journal abstract.*

3345. Price, Richard H. & Slive, Arnold B. (Indiana U.) **Association value and label relevance in shape recognition.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 43-46. —Examined the effects of association value and label relevance on Ss' recognition accuracy and criterion for reporting a shape as seen before. Results from 100 undergraduates indicate that association value affected both recognition performance and Ss' criterion for reporting a shape as seen before. Label relevance improved recognition performance but did not affect Ss' criterion. The roles of association value and label relevance are discussed in terms of their effects on the production of labels during both learning and recognition phases of the experiment.—*Journal abstract.*

3346. Rankin, William C., Markley, Robert P., & Evans, Selby H. **Pythagorean distance and the judged similarity of schematic stimuli.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1969(Dec), No. 25-69, 17 p. —Independent groups of undergraduates (N = 30) rated the similarity of pairs of patterns belonging to the same class, either before or after a discrimination task of schematic concept formation (SCF). Average judged similarity increased as a function of SCF pretraining. A linear relationship was found between a Pythagorean-distance measure on the patterns and subjective similarity of pairs of stimuli ($r = .88$). Pythagorean distance between pairs of patterns was measured by summing the squared differences between their corresponding physical attributes. No such relationship was obtained from an analysis of judgments from a group that viewed random, nonschematic stimuli. A secondary analysis of the discrimination judgments in the SCF task showed that the Pythagorean-distance measure was predictive of judgments on pairs of stimuli from the same schema family, but the relationship did not hold for pairs representing 2 different schemata. Multidimensional scaling analyses indicated that mildly deviant schematic stimuli were perceived to be instances of a single family. The dimensions describing a schema cluster appeared to be specific to the sample of stimuli. A tendency for the Kruskal procedures to collapse certain types of stimulus clusters was observed and discussed. (19 ref.)—*Journal abstract.*

3347. Steinheiser, Frederick H. (U. Minnesota, Center for Research in Human Learning) **Individual preference scales within a multidimensional "similarities" space.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 325-327. —Obtained paired comparison judgments of preference and similarity from 27

undergraduates, who were given all possible pairings of 16 abstract polygons. The grouped similarities data were subjected to a nonmetric multidimensional analysis, resulting in an adequate 3-dimensional solution. A Euclidean distance metric was used to find interpoint distances in this 3-space. Assuming that increasing distance reflects decreasing similarity, the less preferred patterns would be perceived as being more highly dissimilar to the highly preferred patterns. Patterns were less preferred as their distances increased from the most preferred patterns.—*Journal abstract.*

Eye Movement

3348. Holt-Hansen, Kristian. (Copenhagen U., Psychological Lab., Denmark) **An electronic explanation of experienced oscillating movements.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 179-186.—Demonstrates that the beta-apparent movement seems to be classifiable as 1 of the oscillating forms for apparent movement, and offers an approach and explanation based on an electronic working-model. (17 ref.)—*Journal abstract.*

3349. Reeves, John L., Cogan, Rosemary, & Cogan, Dennis C. (Texas Technical Coll.) **Autokinetic movement as a function of color.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 210.—Randomly presented red, green, blue, and yellow filtered auto-kinetic stimuli to 18 undergraduates with normal color vision. No reliable differences in extent of perceived movement were found among the colors. Results are discussed in terms of eye movement theory.—*Author abstract.*

Brightness & Contrast Discrimination

3350. Festinger, Leon; Coren, Stanley, & Rivers, Geoffrey. (New School for Social Research) **The effect of attention on brightness contrast and assimilation.** *American Journal of Psychology*, 1970(Jun), Vol. 83(2), 189-207.—Reports 3 experiments examining the conditions under which brightness assimilation and brightness contrast are obtained. Brightness assimilation was found only under circumstances in which the gray portion of the visual display—the gray portion being compared with some other standard gray—was not the focus of attention. When attention was focused on this gray, brightness contrast was obtained. A theoretical explanation is offered in terms of the effect of attention on perceived average brightness.—*Journal abstract.*

3351. Flock, Howard R. & Freedberg, Edmund. (York U., Downsview, Toronto, Ontario, Canada) **Perceived angle of incidence and achromatic surface color.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 251-256.—Describes theory and evidence proposing illumination, and therefore necessarily angle of incidence of light, as a perceptual cue for lightness judgments. In 2 experiments, angle of incidence was varied by having 46 female Ss view an upright trapezoid that monocularly appeared flat and binocularly, upright. In Exp. I, numbers of cues to the direction of a fixed source above the trapezoid were varied and combined. In Exp. II, the background for an illumination gradient was varied. Angle of incidence and cues to the location of the source did predict the trends in lightness judgments but not the magnitude of the effects. An alternative explanation to cue theory is proposed.—*Journal abstract.*

3352. Sparrock, J. M. (U. West Indies, Kingston, Jamaica) **Stabilized images: Increment thresholds and subjective brightness.** *Journal of the Optical Society of America*, 1969(Jul), Vol. 59(7), 872-874.—Measured changes of brightness sensation (fading) that occur when images are stabilized on the retina with a matching technique. Increment thresholds were measured under the same conditions. Under stabilization, the increment threshold is proportional to stimulus level (Weber's law). Increment thresholds change at a different rate than does brightness; this suggests that these mechanisms behave independently.—*Journal abstract.*

AUDITION

3353. Smith, Paul F., Harris, Martin S., Russotti, Joseph S., & Myers, Cecil K. **Effects of exposure to intense low frequency tones on hearing and performance.** *U.S. Naval Submarine Medical Center Report*, 1970(Jan), No. 610, 4 p.—Exposed 12 Naval enlisted personnel for a 24-hr period to either 70-Hz tones at 112.8 ± 10 db. re .0002 dynes/cm² or 300-Hz tones at 113.4 ± 3 db. re .0002 dynes/cm² or 300-Hz tones at 113.4 ± 3 db. re .0002 dynes/cm². During the exposure, performance on a sensorimotor task (RATER) was tested periodically, and auditory threshold shifts were measured. No decrement in RATER performance was noted for either group. Temporary threshold shifts were moderate except for 1 S. The general behavior of the groups and statements made during informal interviews indicates that similar exposure conditions would be well tolerated on a routine basis.—*Journal abstract.*

3354. Wilson, Richard H., Dirks, Donald D., & Carterette, Edward C. (U. California, Los Angeles) **Effects of ear preference and order bias on the reception of verbal materials.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 509-522.—Investigated J. Inglis' hypothesis that dichotic verbal material presented to the right ear is produced correctly more often than the stimuli presented to the left ear because individuals respond initially to the material at the right ear and thus are subject to greater trace decay on that presented to the left ear. 2 types of dichotic materials (digits and nonsense syllables) were presented in quiet and also in a background of white noise. Different groups of 24 18-21 yr. old Ss were used in 4 basic experiments. Ss were tested under the following conditions: (a) no bias, (b) right bias (instructed to respond to right ear presentations initially), and (c) left bias (instructed to respond to left ear presentations initially). Results of the no bias conditions suggest a tendency for more correct responses from right ear than from left ear presentations (even though order of response was divided almost equally between the ears). However, the superiority is only a modest statistical one. When instructional bias was imposed, the results always favored the ear of the instructed bias. (20 ref.)—*Journal abstract.*

Perception

3355. Creel, Warren; Boomsliter, Paul C., & Powers, Samuel R. (Union U., Albany Medical Coll.) **Sensations of tone as perceptual forms.** *Psychological Review*, 1970(Nov), Vol. 77(6), 534-545.—The perception of sound is time-dependent. What is experienced is an imposed form. Its raw material is memory of the past

portion of the stimulus and expectation of its future. The auditory input itself is, at any given instant, a single stimulus which, standing alone, has no pattern or meaning. Investigation of larger sound patterns in language and in music has led to evidence that the sensation of tone is itself an imposed form. That central neural factors are important to tonal sensation is shown by tone-noise tests given to 55 patients before and after surgery to improve blood supply to the brainstem. In other phenomena of tone, the brain exhibits the properties of an apparatus that works by neural mechanisms of temporal recurrence. (45 ref.)—*Journal abstract*.

3356. Saxman, John H. (U. Wisconsin) **Differential sensitivity to auditory feedback delay intervals: A preliminary study.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 595-599. Assessed differential sensitivity to delay interval change (jnd) for 6 female Ss at 12 standard delay times ranging from 30-360 msec. The speaker's self-generated speech signal (/da/) and its return via delayed auditory feedback constituted the interval boundaries. Mean absolute jnds varied in magnitude from 15.45-19.66 msec. and were found to be independent of the standard delay times. The relative sensitivity to delay change decreased rapidly at the shorter delay times, then leveled off to a fairly gradual slope beginning at approximately 150 msec.—*Journal abstract*.

3357. Saxman, John H. & Hanley, Theodore D. (U. Wisconsin) **Perception of auditory feedback delay: Subjective estimate of delay magnitude.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 861-868. 20 female undergraduate and graduate students selected by the method of fractionation, the delay interval judged by them to be $\frac{1}{2}$ the duration of the standard delay interval with which it was paired. The signals judged were the delay intervals between the Ss' own production of the syllable /da/ and its return via delayed auditory feedback. 10 ascending and 10 descending $\frac{1}{2}$ judgments were obtained for each S at each of the standard delay intervals of 100, 200, 400, and 800 msec. The curves for the ascending, descending, and combined ascending-descending judgments, when plotted against delay intervals in physical time, were all nearly linear with a slight positively accelerated slope. A tentative scale of subjective delay time is described and its implications for evaluating the speech response to delayed auditory feedback as a function of time are noted.—*Journal abstract*.

3358. Simon, J. Richard; Craft, John L., & Small, A. M. (U. Iowa) **Manipulating the strength of a stereotype: Interference effects in an auditory information-processing task.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 63-68. In a choice RT task, 96 undergraduates pressed either a right- or left-hand key in response to monaural "right" and "left" commands conveyed by 200- and 500-Hz, 96-dB SPL tones. Commands were either presented alone (no-noise trials) or accompanied by a broad-band noise to the same or opposite ear. On the no-noise trials, RT was significantly faster when the meaning of the command corresponded to the ear in which it was heard than when it did not. This Tonal Command \times Ear Stimulated interaction was eliminated, reduced, or reversed by manipulating the noise intensity at the opposite ear, and was accentuated by introducing accompanying noise to the same ear. Results are explained in terms of a potent

natural tendency to react toward the major source of stimulation.—*Journal abstract*.

3359. Tolkmitt, Frank J. (U. Melbourne, Victoria, Australia) **Journal of Experimental Psychology**, 1970(Nov), Vol. 86(2), 171-180.—Derives a model for sequential processing in audition from the results of 3 experiments. 20 undergraduates and graduate students localized 8 sound sources, installed in a horizontal plane around S's head, which could be activated in any desirable sequence by bursts of white noise. Exp. I shows that perception of rotating white noise changed systematically when burst duration was reduced from 400 to 25 msec. The perceptual change is ascribed to a reduction of the time allowance for locating a single source, thereby making impossible complex locating decisions. In Exp. II, this explanation is empirically supported by decision times computed separately for different burst durations. Shortening burst duration decreased selectively the localization frequency of the 8 speakers. Exp. III indicates that Ss suffered from illusions, thought to arise because of the necessity to allocate the time allowance as fast as possible. (15 ref.)—*Journal abstract*.

3360. Webster, J. C., Carpenter, A., & Woodhead, M. (Applied Psychology Research Unit, Cambridge, England) **Perceiving steady state vowel, musical, and meaningless sounds.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 616-621.—3 groups of 6 Navy enlisted men listened 2 periods/day for a wk. to each of 3 tests, made up of 9 different complex steady state sounds. On 1 test all 9 sounds had fundamental frequencies of 55 Hz.; on the 2nd, 110 Hz.; and on the 3rd, 220 Hz. 3 of the 9 sounds were completely meaningless and remained so on all 3 tests. 3 sounds were segments of the intoned vowels, a, i, and u when the fundamental frequency was 110 Hz. When shifted in frequency 1 octave the resultant sounds were perhaps vowel-like but were not a, i, and u. 3 sounds were the tones of musical instruments when the fundamental frequency was 220 Hz. Ss identified each sound by an arbitrarily assigned number. The group that heard the real vowels always made fewer errors in assigning numbers to them. When all sounds were shifted upward or downward 1 octave, errors among the 3 classes of sounds were equally divided for the 1st test session. At the end of 1 wk. there were fewer errors on the vowel-derived sounds sounding down 1 octave and on the meaningless sounds sounding up 1 octave at 220 Hz.—*Journal abstract*.

3361. Webster, John C., Woodhead, Muriel M., & Carpenter, Alan. (U.S. Naval Electronics Lab. Center, San Diego, Calif.) **Perceptual constancy in complex sound identification.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 481-489.—Investigated whether there are perceptual constancies between classes of complex sounds, even though the acoustic information is very different. 17 male listeners identified sounds consisting of vowels, musical instrument tones, and meaningless buzz sounds, presented at 3 different fundamental frequencies (octave shifts), and at 3 signal-to-noise differentials. The sounds were numbered but not named. The vowels had voice-like quality in mid-octave (110 Hz.); the musical tones sounded music-like at the highest octave (220 Hz.); at the lowest octave (55 Hz.) both music and vowels were physically meaningless; the meaningless buzz sounds had no greater relevance in 1 octave than any other. These buzz

sounds could be distinguished from each other by differing harmonic patterns. It was found that, in the absence of masking noise, the vowels were better identified in midoctave than were the musical and meaningless sounds. The musical sounds were not better identified than the others in high octave. The meaningless sounds were unexpectedly easier to identify in the low octave. They generally withstood thermal noise masking well, but not buzz masking, compared with the musical and vowel sounds. It was more difficult to identify musical and vowel sounds during thermal noise masking than during buzz masking. It is concluded that the fixed-ratio hypothesis is not applicable to vowel (formant) sounds within the octaves tested, but may be used to explain the constancy of identification for sounds which depend on harmonic patterning.—*Journal abstract*.

3362. Yates, Aubrey J., Martin, Margaret, & Di Lollo, Vincent. (U. Western Australia, Nedlands) **Retrieval strategy in dichotic listening as a function of presentation rate and structure of material.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 26-31.—Examined the effect of 3 types of structure and 3 rates of presentation of material 2 4-word sentences delivered dichotically in the auditory modality) on strategy of retrieval in 90 undergraduates. Structure was by ears, by pairs, or random; rate of presentation was fast (interpair interval of 200 msec.), intermediate (1200 msec.), or slow (2700 msec.). By-ears and by-pairs order scores were calculated. Results indicate that with random structure, retrieval by ears predominated at the fast presentation rate, retrieval by pairs at the slow rate, while both retrieval types were equally frequent at the intermediate rate. When structure was imposed on the material, it significantly modified the effects of presentation rate, accentuating or reversing retrieval strategy depending on whether the imposed structure was congruent with, or opposed, the influence of presentation rate. It is concluded that structure is a more important determinant of retrieval strategy than presentation rate when both are operating simultaneously. *Journal abstract*.

Speech Discrimination

3363. Black, John W. (Ohio State U.) **Responses to multiple-choice intelligibility tests.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 453-466. —Administered multiple-choice intelligibility tests consisting of 4-word response sets to about 480 listeners at 4 signal-to-noise ratios and at 4 signal levels. 3 types of analysis were made: (a) the response sets were studied for phonetic-phonemic disparity, (b) the correct responses to the sets were tallied (intelligibility scores), and (c) the distribution of responses within each set was measured (uncertainty). Analyses indicate that: (a) there is a limited relation between phonetic-phonemic disparity within a set and the correct responses, (b) there is a tendency of "easy" and "hard" response sets to maintain their relative ranks from 1 listening condition to another, (c) the correct responses and the uncertainty of the response sets are negatively correlated, and (d) in an analysis of the errors the relative frequency of occurrence of the error responses is not a constant from 1 listening condition to another. Based on the obtained data, a procedure is suggested for determining these frequencies if the correct score is known. (20 ref.) —*Journal abstract*.

3364. Carhart, Raymond; Tillman, Tom W., & Daillos, Peter J. (Northwestern U.) **Unmasking for pure tones and spondee: Interaural phase and time disparities.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 722-734. Interference with the binaural intelligibility of spondee words and the binaural detection of a sinusoid of continuously varying frequency (250-4000 Hz.) produced by 2 continuous independent random noise signals was measured in 10 normal-hearing adults at 3 masker levels under 5 conditions of listening: homophasic, parallel antiphase, opposed antiphase, parallel time delay, and opposed time delay. The 2 antiphase conditions produced equivalent masking-level differences (MLDs) for spondee words (5.3 db. re homophasic level). The MLDs for the 2 time-delay conditions ($t = .8$ msec.) were also approximately equal, but were appreciably smaller (3.8 db.). For pure-tone signals, averaged MLDs were also less for time-delayed than for antiphase listening, but the 4 nonhomophasic conditions yielded functions relating MLD to frequency that had a common pattern. MLDs increased with frequency between 250 and 400 Hz., were maximal in the range between 400 and 800 Hz., and then declined to very small but fairly uniform values above 1200 Hz. A comparison of the MLDs yielded for pure tones with those for spondee supports the conclusion that MLDs for spondee are mediated by the release from masking that occurs for the spectral components involved in spondee reception at threshold level. (15 ref.) *Journal abstract*.

3365. Kreul, E. James, et al. (Stanford Research Inst., Menlo Park, Calif.) **A proposed clinical test of speech discrimination.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 536-552. —The Modified Rhyme Test has been adapted to the needs of the clinical audiologist. Tape recordings of 1 female and 2 male speakers were made, evaluated, and assembled in a format suitable for use as a clinical tool. Special attention was given to ensure an appropriate carrier phrase, consistent timing sequences, well-controlled recordings, simplified instructions, and test forms. The tests were administered to panels of listeners, and results were assessed for possible effects of learning, speaker or listener differences, and comparability of test lists. The recordings are available, for all 3 speakers, with the noise adjusted to yield approximately the same percentage of correct responses for normal listeners, 96, 83, and 75% correct. —*Journal abstract*.

3366. Sticht, Thomas G. **Comprehension of repeated time-compressed recordings.** *Journal of Experimental Education*, 1969(Sum), Vol. 37(4), 3 p. Used time-compressed, tape recorded messages to determine if listening to the message twice, in the same amount of time required to listen to the uncompressed message once, would improve listening comprehension scores of 40 high and 40 low aptitude Army inductees. Results indicate that for both groups, listening to the compressed messages twice improved comprehension scores over scores obtained by listening to the compressed tapes once. Comprehension of repeated time-compressed messages was not improved over that obtained by a single listening to the uncompressed messages. *Journal abstract*.

Audiometry

3367. Harris, J. Donald. **An efficient monaural procedure for the psychoacoustic calibration of**

earphones. *U.S. Naval Submarine Medical Center Report*, 1969(Sep), No. 593, 9 p.—Examines a new procedure for psychoacoustic calibration of earphones in which the air-conducted outputs of a standard and an unknown earphone are successively equated for loudness to a reference bone-conducted tone. Ss were 12 graduate students. The problem to the S is one of monaural loudness discrimination, with a relatively small variance (differential sensitivity = 1.23–1.61 db.), and involves only 4 sources of variance associated with coupling 2 earphones to the same ear, and a single loudness discrimination judgment for each phone. The mean test-retest difference in the earphone transfer functions varied by 1.33–5.89 db. at different frequencies, mid-value = 3.36 db. Only a few min. are required to complete an S's observations at any frequency. Acceptable group means for transferring audiometric standards to an unknown earphone could be obtained at any frequency by requiring as few as 9 Ss to make a single monaural loudness discrimination/earphone by this technique. The mean test-retest difference in the earphone transfer functions by the traditional ear-reversal method varied from 4.16–7.54 db. at different frequencies, mid-value = 6.30 db., nearly twice that of the suggested procedure.—*Journal abstract.*

3368. **Harris, J. Donald & Myers, Cecil K.** *Tentative audiometric hearing threshold level standards from 8 through 18 kHz.* *U.S. Naval Submarine Medical Center Memorandum Report*, 1970(Feb), No. 70-2, 2 p.—Both ears of 100 young healthy 17–23 yr. old candidates for Submarine Service, normal by otoscopy but otherwise unselected, were given Békésy-type audiometry through 18 kHz. Minimum audible pressures were obtained comparable to those from a study on adolescent males; there was also correspondence with the British Standard for young adults up to 15 kHz. It is suggested that the time is approaching for standardizing audiometry in the octave 10–20 kHz. using all available data.—*Journal abstract.*

3369. **Hattler, Karl W.** (U. Oklahoma, Oklahoma City) *The Type V Bekesy pattern: The effects of loudness memory.* *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 567–575.—10 trained, audiometrically normal graduate students heard a 1-kHz reference tone at 50-db or 80-db SPL. Ss maintained the reference loudness throughout a 3-min 1-kHz fixed-frequency run. 7 test signals, consisting of 1 sustained and 6 differentially interrupted pure tones, were employed for loudness-memory tracking. Preliminary training eliminated learning effects. 30-sec pretracking adaptation periods produced loudness adaptation which was complete to asymptote for each test signal. Tracking levels were inversely related to the signal's duty cycle and were independent of other temporal parameters such as on-duration and interruption rate. The occurrence of the Type V Bekesy audiogram is attributed to the differential effects of memory upon the loudness of sustained and interrupted pure tones. (19 ref.)—*Journal abstract.*

3370. **Kopra, Lennart L. & Blosser, Dennis.** (U. Texas) *Effects of method of measurement on most comfortable loudness level for speech.* *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 497–508.—Tested 18 male and 18 female undergraduates, all with normal hearing, for the effects of 3 variables on most comfortable loudness (MCL) level for speech. Variables were (a) 3 measurement methods, (b) sex of listener, and (c) repeated testing. MCL levels for speech were

measured in an initial test session and a retest session by the method of adjustment, the method of limits, and the Bekesy audiometer. Results show that: (a) all 3 measurement methods produced similar mean MCL levels in both test and retest, (b) mean MCL levels did not change significantly from test to retest for any single measurement method, (c) sex of listener did not significantly affect mean MCL level, (d) MCL levels as measured by the 3 methods were significantly correlated, (e) test-retest correlations for each measurement method were significant, and (f) Bekesy audiometer tracings of MCL level remained stable over the 4½-min test periods in both initial test and retest sessions.—*Journal abstract.*

3371. **Myers, Cecil K. & Harris, J. Donald.** *Comparison of seven systems for air conduction audiometry from 8–20 kc/s.* *U.S. Naval Submarine Medical Center Report*, 1969(Feb), No. 567, 12 p.—Assembled 7 equipment systems to study human auditory acuity from 8–20 kcps. 10 otologically normal adults served as Ss. 2 loudspeakers and 2 earphones, 2 types of stimulus and 2 psychometric methods were utilized. All systems were capable of providing useably reliable thresholds throughout the whole frequency range. When objectively calibrated, several systems yielded comparable reference threshold SPLs as inferred at the eardrum. A slight preference was expressed for the method of using Békésy threshold-tracking, with a changing-frequency noise band 300 cps in width, and for a discrete-tone system which uses the method of constants.—*Journal abstract.*

3372. **Shepherd, David C. & Goldstein, Robert.** (Jewish Hosp., St. Louis, Mo.) *Intrasubject variability in amplitude of Bekesy tracings and its relation to measures of personality.* *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 523–535.—Obtained test-retest measures of Bekesy amplitude from 10 normal-hearing adults on 8 different days. Measures were analyzed to determine: (a) the extent of intrasubject variability among repeated measures of Bekesy amplitudes traced by Ss, and (b) the relation of intra-S differences in Bekesy amplitudes to day-to-day changes in anxiety and other measures of personality construct. Findings indicate that intra-S variability in the amplitude of Bekesy tracings produced by normal-hearing Ss is less than reported measures of inter-S variability of Bekesy amplitudes obtained from groups of normal-hearing Ss. Ss who traced narrow Bekesy amplitudes scored significantly higher on measures of anxiety and depression than did those who traced moderate or wide amplitudes. Wide swingers scored higher on a measure of defensiveness than did moderate or narrow swingers, and moderate swingers were significantly more defensive than narrow swingers. Day-to-day changes in anxiety did not relate to day-to-day changes in Bekesy amplitudes traced by any one of the Ss.—*Journal abstract.*

3373. **Willott, James F.** *A determination for the Navy of Zero Hearing Level for Speech.* *U.S. Naval Submarine Medical Center Memorandum Report*, 1969(Jul), No. 69-7, 3 p.—Examined 23 normal-hearing candidates for the Submarine Force for speech reception threshold (SRT) by speech audiometry using phonetically-balanced (PB) lists of monosyllables instead of the usual spondee words. Such PB words are better in assessing the important frequency regions for daily speech communication, namely, 500–2000 cps. The Navy threshold for SRT_{PB} is 25-db SPL re .0002 dyne/cm², or 6 db. higher than the standard SRT (spondees). A standard speech audiometer, now calibrated for spon-

dees according to United States Standards Institute specifications, can then be used with the PB lists by subtracting 6 db. from the hearing level dial reading to arrive at the particular S's SRT._{FB}—*Journal abstract.*

3374. Willott, James F., Myers, Cecil K., & Harris, J. Donald. **Differential sensitivity for alternate interaural loudness balancing in the psychoacoustic calibration of earphones.** *U.S. Naval Submarine Medical Center Report*, 1969(Sep), No. 594, 6 p.—Examined the variances associated with the psychoacoustic calibration of audiometric earphones by the method of alternate interaural loudness balancing with a standard earphone 1st on 1 side of the head and then on the other. 8 major sources of variance can be identified. On 13 graduate students the differential sensitivity for alternate interaural loudness balancing was 1.5–2.5 db., the higher frequencies giving somewhat larger values. Variances due to coupling and to absolute threshold testing were estimated at about 1 db. for the former and from 1.27–2.51 db. for the latter. The sizes of these variances were considered sufficient to explain the test-retest consistency of mean transfer functions, which were of the order of 6 db. The group mean transfer function could be specified for either of 2 new circumaural earphones with a precision of .92–4.84 db. at various audiometric frequencies (± 1 standard error).—*Journal abstract.*

CHEMICAL SENSES

SOMESTHESIA

3376. Brecher, M. Herbert & Brecher, Gerhard A. (U. Oklahoma, Medical Center, Oklahoma City) **Motor effects from visually induced disorientation in man.** *FAA Office of Aviation Medicine Report*, 1969(Nov), No. 69-23, 7 p.—Walking behavior was assessed inside an optokinetic drum. Path tracings of attempts at straight forward and backward walking showed no deviations when the drum was stationary, but did show deviations in the direction of drum movement when the drum was rotating. A nonlinear increase in deviations from a straight path accompanied faster drum speeds (range: 3–45 rad/min). 2 types of corrective training were attempted but both were unsuccessful with most Ss.—*W. E. Collins.*

3377. Brecher, M. Herbert & Brecher, Gerhard A. (U. Oklahoma, Medical Center, Oklahoma City) **Quantitative evaluation of optically induced disorientation.** *FAA Office of Aviation Medicine Report*, 1970(Jan), No. 70-2, 3 p.—Tested S's ability to walk a straight path inside an optokinetic drum. Although angular deviation from a straight path increased with increasing drum speeds (3–45 rad/min), it did so at decreasing rates. At drum velocities of 20 rad/min or less, most Ss were unaware of their inability to walk a straight path. At high drum velocities, Ss apparently were more aware of the "disorientation" and were partially successful in compensating for it.—*W. E. Collins.*

3378. Gilbert, A. J. (Western Australian Inst. of Technology, South Bently) **A further study of factors involved in judgments made by the method of**

constant stimuli. *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 169–175.—A recent report by A. J. Gilbert (see PA, Vol. 42:8237) indicated that, with a procedure involving tactile stimulation of both forearms, there are several factors involved in judgments made by the method of constant stimuli. It is suggested that these factors include general adaptation, a specific adaptation to the standard stimulus, adaptation to the comparison stimuli, and some factor or factors related to the interval between judgments. In an experiment with 48 undergraduates, results from tactile stimulation of the 1 forearm indicate that possibly only 2 adaptive factors are operative in this situation. At least 1 other factor, possibly related to short-term memory and the sensory aspects of the stimulation, must enter into some functional relationship with the stimulus values.—*Journal abstract.*

3379. Warm, Joel S., Clark, Jeffrey L., & Foulke, Emerson. (U. Cincinnati) **Effects of differential spatial orientation on tactual pattern recognition.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 87–94.—Assessed the effects of variation in the relative spatial orientation of figures on tactual pattern recognition. Ss were 48 undergraduates. Metric figures at 2 levels of complexity, 4×4 and 6×6 , were used. Ss determined which of 2 choice figures was identical to a previously presented target (identity indicator response) or, if neither of the 2 choice figures was identical to the target (nonidentity indicator response). 2 orientation conditions were employed: (a) all figures were oriented in the same direction and (b) choice figures were oriented in different directions relative to the target and to each other. In general, differential orientation degraded both the accuracy and speed of recognition. The negative effects of differential orientation were dependent upon figure complexity and the type of indicator response when perceptual performance was measured in terms of accuracy but not when a speed index was used. Patterns at the low level of complexity were recognized more rapidly than high complexity patterns when a non-identity indicator response was required; no differences between complexity levels were noted with the identity indicator response. (16 ref.)—*Journal abstract.*

ENVIRONMENTAL EFFECTS

3380. Rohles, F. H. (Kansas State U.) **Thermal sensations of sedentary man in moderate temperatures: Special report.** Manhattan, Kan.: Kansas State U., Inst. for Environmental Research, 1970. 122 p.—Determined the range of thermal conditions at which sedentary Ss report feeling comfortable. 1600 college students were exposed in groups of 5 men and 5 women each to 20 dry bulb temperatures ranging from 60–98° F in increments of 2° at each of 8 relative humidities: 15, 25, 35, 45, 55, 65, 75, and 85%. Ss reported their thermal sensations on a ballot every $\frac{1}{2}$ hr. Results show that for sedentary Ss in standard clothing with an insulative value of .6 clo for 3 hr., the "comfortable" votes ranged from 62–98° F. It was also found that men feel warmer than women during their 1st hr. at a given temperature and that humidity plays a significantly more important role in how men feel than how women feel.—*Author abstract.*

SLEEP & FATIGUE & DREAMS

3381. Backeland, Frederick. (State U. New York, Downstate Medical Center, Brooklyn) **Correlates of**

home dream recall: Reported home sleep characteristics and home dream recall. *Comprehensive Psychiatry*, 1969(Nov), Vol. 10(6), 482-491.—A sleep and dream log was filled out by 55 young adult males for 14 consecutive days. Detailed dream reports tended to come from end of the night REM-period awakenings while vague reports were associated with nocturnal awakenings with relatively long times back to sleep, and no-content dream reports were derived from briefer nocturnal awakenings. Frequent detailed dream recallers as compared with nonrecallers took longer to get to sleep but were calmer before sleep, had less abrupt and more spontaneous terminal awakenings, and reported feeling more refreshed on awakening. Recallers tended to awaken from REM sleep and nonrecallers from NREM sleep in the morning. No relationship was found between cognitive style and ease of dream recall in this sample of Ss. (37 ref.)—*Journal summary*.

3382. **Tart, Charles T. & Dick, Lois.** (U. California, Davis) **Conscious control of dreaming: The post-hypnotic dream.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 304-315.—13 highly hypnotizable undergraduates each spent 2 nights in the laboratory. Before going to sleep, they were deeply hypnotized and instructed to dream about a stimulus narrative in every Stage-1 REM dream of the night. A 2nd stimulus narrative was used for the other night in counterbalanced order. Dream reports were obtained from Stage-1 REM awakenings. All Ss but 1 showed some effects, and the mean effect across Ss ranges from 2 1/2-4 elements of the stimulus narratives clearly appearing in the dreams. The peak effect ranged from 0-24 1/2 elements. Thematic analysis indicates that 8 reported at least 1 dream in which the stimulus narrative was a dominant content organizer. The number of stimulus narrative elements appearing in the dream reports was positively correlated with hypnotizability, i.e., with factors of hypnotizability characterizing an ability to function in an altered state of consciousness and negatively with the compulsive, inhibitory aspects of hypnotizability. Hypnosis is clearly helpful, but may not be necessary to achieve deliberate control of dream content. Such control may have important therapeutic and growth applications. (51 ref.)—*Journal abstract*.

3383. **Tent, Lothar.** (Philipps U. Marburg, Inst. für Psychologie, W. Germany) **Versuche zur Früherfassung von Merkmalen mentaler Überbeanspruchung: Ein Beitrag zum Problem der vorzeitigen Invalidität.** [Investigation concerning early detection of characteristics of mental overwork: A contribution to the problem of early disability.] *Archiv für die gesamte Psychologie*, 1968(Aug), Vol. 120(1), 1-24.—Assesses variables of permanent mental overwork, which, in extreme cases, may contribute to early disability. The risk of mental overwork is defined as the permanent 1-sided deviation from the convergency rule stating that mental expenditure and achievement tend to adapt on a harmonized individual level of activity. Disproportionately high relative expenditure may lead to an overdrawing of the regulating tolerance and result in early disability with forced convergency on a low activity level. In a 4-hr laboratory experiment with 30 students, the final quotient of (normalized) expenditure (pulse rate) and (normalized) achievement—dependent variable—could be predicted by means of weighted data from a different experiment—-independent variables ($R = .7$, $P < 1\%$). This relationship was not reproduced satisfactorily in a subsequent investigation of 102

industrial workers using ratings of superiors as a makeshift criterion. The multiple correlation between rated susceptibility and 4 variables: body-weight, blood-pressure, concentration test score, and achievement motivation, was only $R = .4$ ($P < 5\%$). In a discriminatory analysis, the means of weighted predictor scores of 2 extreme subgroups ($N = 20$; 22) differed very significantly with still considerable overlap. This approach was discussed in terms of G. P. Lienert's regression theory, and M. Haider's deactivation theory of fatigue. (53 ref.)—*English summary*.

3384. **Weitzman, Elliot D., et al.** (Albert Einstein Coll. of Medicine, Yeshiva U.) **Acute reversal of the sleep-waking cycle in man: Effect on sleep stage patterns.** *Archives of Neurology*, 1970(Jun), Vol. 22(6), 483-489.—Changes in sleep patterns result from acute sleep-waking cycle reversal. 5 healthy adult males slept for 1 wk. from 10 PM to 6 AM, followed by 2 wk. of day sleep from 10 AM to 6 PM. Increase in time spent awake and decrease in REM sleep time occurred during the inverted sleep period. Duration of episodes in all stages of sleep decreased after reversal, while the number of changes in sleep stages increased. Results suggest the importance of a polygraphic definition of sleep, implications for understanding endogenous depression and narcolepsy, and applications for a growing number of occupations in today's society that involve sleep-waking reversals. (29 ref.)—*S. E. Gavin*.

HYPNOSIS & SUGGESTIBILITY

3385. **Evans, Michael B. & Paul, Gordon L.** (U. Illinois, Children's Research Center Bldg.) **Effects of hypnotically suggested analgesia on physiological and subjective responses to cold stress.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 362-371.—Evaluated relative effects of suggested analgesia and hypnotic induction regarding reduction of stress responses (self-report, heart rate, pulse volume) to the physical application of ice-water stress. 4 groups ($N = 16$ each) of undergraduate female Ss, equated on hypnotic susceptibility, were run individually, receiving (a) hypnotic induction plus analgesic suggestion, (b) hypnotic induction alone, (c) waking self-relaxation plus analgesic suggestion, or (d) waking self-relaxation alone. The major findings were that suggestion, not hypnotic induction procedures, produced reductions in the self-report of distress, and that the degree of reduction was related to hypnotic susceptibility in both hypnotic and waking conditions. Neither suggestion nor hypnotic induction procedures resulted in reduction of the physiological stress responses monitored. Several methodological issues are discussed. Although findings add to the bulk of evidence supporting the skeptical view of hypnotic phenomena, results are related to other literature, suggesting that an adequate clinical evaluation of hypnotic analgesia has not yet been undertaken. (37 ref.)—*Journal abstract*.

3386. **Fromm, Erika; Oberlander, Mark I., & Gruenewald, Doris.** (U. Chicago) **Perceptual and cognitive processes in different states of consciousness: The waking state and hypnosis.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 375-387.—Hypnosis was assumed to influence perceptual and cognitive functioning in the direction of increased primary process ideation and adaptive regression. The Rorschach test was adminis-

tered to 32 undergraduates in the waking state and under hypnosis in counterbalanced order. Hypnosis was induced by a standardized procedure. Ss received identical instructions for the Rorschach in both conditions. Protocols were scored according to R. R. Holt's system for manifestations and control of primary process. Hypnotic Rorschachs showed an increase in primary process manifestations, but no changes in defensive and coping functioning, and no overall changes in the Adaptive Regression score. However, the nature of the data was found to be influenced by Ss' sex and level of adjustment. (40 ref.)—*Journal abstract.*

3387. Sachs, Lewis B. (West Virginia U.) **Comparison of hypnotic analgesia and hypnotic relaxation during stimulation by a continuous pain source.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 206-210.—Upon completion of training, 5 high school students had their arm immersed in 0° C water during both a hypnotic relaxed-hypnotic analgesic and a hypnotic analgesic-hypnotic relaxed testing sequence. Blood pressure and subjective pain responses were measured during presentation of this continuous pain source, enabling Ss to be compared under the hypnotic analgesic and hypnotic relaxed conditions. Although the analgesic conditions produced far greater effect upon the subjective pain responses than on the blood pressure, each S indicated lower blood pressure scores over the combined analgesic conditions than over the combined relaxed conditions. The reduction of subjective pain responses were in agreement with results of an anonymous questionnaire, providing further confirmation for the obtained analgesia.—*Journal abstract.*

3388. Schneck, Jerome M. (St. Vincent's Hosp. & Medical Center, New York, N.Y.) **Sleep paralysis and spontaneous hypnotic paralysis.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 16.—Comments on the resemblances between sleep paralysis and spontaneous hypnotic paralysis, and encourages further investigation.

3389. Sutcliffe, J. P., Perry, C. W., & Sheehan, P. W. (U. Sydney, New South Wales, Australia) **Relation of some aspects of imagery and fantasy to hypnotic susceptibility.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 279-287.—Studied relations between hypnotic susceptibility and some aspects of imagery and fantasy in a normal population of 95 undergraduates. Vividness of imagery was assessed by a reliable questionnaire adapted from procedures 1st devised by G. H. Betts; dreams were collected by a diary method which studied the incidence of distortion in dream content; and hypnotizability was assessed by the Stanford Hypnotic Susceptibility scale (Form C), a standardized scale devised by the authors, and a rating procedure based on both scales. Results show a positive, curvilinear relationship between vividness of imagery and hypnotic susceptibility, but no significant relationship for fantasy. Evidence suggests that both imagery and fantasy, considered conjointly, lead to a more accurate prediction of deep susceptibility than the imagery variable alone. (34 ref.)—*Journal abstract.*

3390. Tart, Charles T. (U. California, Davis) **Transpersonal potentialities of deep hypnosis.** *Journal of Transpersonal Psychology*, 1970, Vol. 2(1), 27-40.—Following a general discussion of hypnosis, a variety of behaviors occurring in an S under self-reported deep hypnosis is described. Physical relaxation increased as did visual blackness and peacefulness. Awareness of the environment and sense of personal identity decreased. Awareness of a joke rose at a certain point and then

faded out with still deeper hypnosis. A sense of potentiality increased until anything appeared possible. E's identity was sharply focused but with greater depth became remote and finally was lost. Time passed more slowly up to a point and then time became a meaningless concept. A feeling of oneness with the universe increased while awareness of breathing dropped sharply and spontaneous mental activity decreased. It is concluded that hypnosis can be used to move to relatively profound states of consciousness and to explore them.—P. E. Lichtenstein.

MOTIVATION & EMOTION

3391. Corah, Norman & Boffa, Joseph. (State U. New York, Buffalo) **Perceived control, self-observation, and response to aversive stimulation.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 1-4.—Attempted to reconcile the apparently discrepant findings of R. A. Champion's and R. J. Bandler, G. R. Madaras, and D. J. Bem's (see PA, Vol. 42:13090) studies of response to aversive stimuli. It was hypothesized that the discrepancy was in part a function of the choice provided by the Bandler, et al. instructions. 40 undergraduates were given 10 escape and 10 no-escape trials from aversive white noise. 1/2 of the Ss were given instructions which gave them the choice of escape or no escape, while the other 1/2 were given no such choice. Results support both studies. The use of choice instructions appears to be equivalent to giving the S a sense of control over the threatening stimulus.—*Journal abstract.*

3392. Davenport, W. G. (U. Newcastle, New South Wales, Australia) **Auditory vigilance: The effects of costs and values on signals.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 213-218.—Examined the effects on signal detection performance of the value of correctly detecting a signal and the costs of a miss and false detection for auditory vigilance behavior. Results from 30 undergraduates suggest that poorer detection performance was obtained with increased costs for misses and false detections, while the value placed on the correct detection of a signal had little effect. The d' statistic of signal detection theory was invariant with both signal costs and time, while β varied with both factors. Results are interpreted to mean that the performance decrement during the vigil was due to an increased strictness in the criterion (β) which the S used for deciding whether or not a signal was present. The cost factors were effective in manipulating performance during the watch by causing changes in the S's decision criteria. Findings unanimously support those predicted by J. A. Swets, W. P. Tanner, and T. G. Birdsall's decision theory; this is suggested as perhaps being the best available basis for a theory of vigilance.—*Journal abstract.*

3393. Hendrick, Clyde & Lilly, Roy S. (Kent State U.) **The structure of mood: A comparison between sleep deprivation and normal wakefulness conditions.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 453-465.—Examined the stability of the factor structure of mood under 2 different experimental conditions, sleep deprivation and normal wakefulness. 2 different forms of a mood scale were administered to several college classes, and the ratings for each scale were intercorrelated and factored. 8 interpretable factors emerged from each analysis, and the 2 sets of factors were highly congruent. In the 2nd phase Ss completed the mood ratings after staying awake all night or after getting a

good night's rest. Comparisons between the means for the 2 groups showed significant differences on 26 of the 44 variables included in the scale. The scores for the sleep-deprived group were then intercorrelated and factored, and the factor structure was compared with the relevant factor structure obtained in the 1st phase of the study. The results of the comparison showed that 6 of the 8 factors appeared under both conditions of sleep deprivation and normal wakefulness.—*Journal summary*.

3394. Lukens, Horace C. (U. Maine) **The emission of affective verbal behavior as a function of two modes of experimenter intervention: A partial replication and extension.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 398.

3395. Matlin, Margaret W. (181 River Meadow Dr., Rochester, N.Y.) **Response competition as a mediating factor in the frequency-affect relationship.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 536-552.—A series of experiments with a total of 263 undergraduates explored an explanation for the documented positive correlation between frequency and affect: that increasing frequency leads to a decrease in the response competition that the novel stimulus elicits, and that response competition is inversely related to affect. When frequency was experimentally manipulated, it was found to be inversely related to 3 measures of response competition: latency of free association, errors in recall of free association, and latency of recall. When samples of English words of varying frequency were tested, the relationship was not as clear. In other studies response competition was varied in 3 different ways. In all 3 cases, subsequent affect ratings show that response competition and affect were inversely related.—*Journal abstract*.

3396. Saegert, Susan C. & Jellison, Jerald M. (U. Michigan) **Effects of initial level of response competition and frequency of exposure on liking and exploratory behavior.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 553-558.—Tested the response competition interpretation of the increase in liking for stimuli as a function of frequency of exposure. 59 male undergraduates served as Ss. As was predicted, liking for complex stimuli increased with increased exposure, and liking for simple stimuli reached asymptote after a small number of exposures. Exploratory behavior was found to decrease as frequency of exposure increased. A relatively low level of liking was associated with the most frequently exposed simple stimuli. This drop in liking is discussed in terms of response competition and levels of cognitive conflict preferred.—*Journal abstract*.

3397. Schmeck, Ronald R. (Southern Illinois U.) **Error-produced frustration as a factor influencing the probability of occurrence of further errors.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 153-156.—Following the demonstration that frustration can produce an increase in the probability of occurrence of errors, R. R. Schmeck and J. L. Bruning (see PA, Vol. 45:Issue 3) noted that errors themselves should produce frustration and an increase in the probability of occurrence of further errors. A pair of experiments, which manipulated and measured the error rate of 30 undergraduates on a button-pressing task, supported the following generalizations: (a) an error produces an increase in the probability that further errors will occur, and (b) this effect apparently does not interact with the complexity of the task. It is theorized

that the nonspecific motivational changes resulting from error-produced frustration raises additional incorrect competing responses above threshold.—*Journal abstract*.

ATTENTION & EXPECTANCY & SET

3398. Adcock, Ngaire V. & Mangan, G. L. (Victoria U., Wellington, New Zealand) **Attention and perceptual learning.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 247-254.—Hypothesized that attention-producing stimuli would act as reinforcers in perceptual learning, and effects would operate across modalities. In the experiment reported 2 emphasisers (electric shock and bell-buzzer) were used with visual and tactual tests of perceptual learning ($N = 64$ male volunteer students). Control groups were used and neutral stimuli introduced for comparison purposes. Finally, severe electric shock was used with a few cases to demonstrate the expected reversal effect of "perceptual defense." The major predictions were confirmed, some at a very high level of significance. The so-called "perceptual defense" effect was explained more parsimoniously in terms of narrowing of attention and high arousal. (34 ref.)—*Author abstract*.

3399. Bindra, Dalbir. (McGill U., Montreal, Quebec, Canada) **The problem of subjective experience: Puzzlement on reading R. W. Sperry's "A modified concept of consciousness."** *Psychological Review*, 1970(Nov), Vol. 77(6), 581-584.—The statement by R. W. Sperry (see PA, Vol. 44:1839) on consciousness is confusing because it entangles the idea of conscious awareness (subjective experience) as an emergent phenomenon of brain function with the idea that such awareness plays a causal role in determining neural activity and behavior. Disentangled, Sperry's hypotheses appear to be circular and dualistic. Whether these difficulties are inherent in his basic position, or are misinterpretations arising from the vagueness of his present statement, would become clear if Sperry further explicates his hypotheses in more concrete terms. (19 ref.)—*Journal abstract*.

3401. Greenwald, Anthony G. (Ohio State U.) **Selective attention as a function of signal rate.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 48-52.—20 undergraduates responded to a series of visually presented digits by speaking each digit's name as rapidly as possible. $\frac{1}{2}$ of the digits were accompanied by a simultaneous conflicting auditory digit and $\frac{1}{2}$ by an auditory tap. Each S provided data for this task at trial rates of 1 every 1, 2, 4, or 8 sec. At all trial rates, RTs to the auditory digit trials were slower than those to the tap trials, indicating inefficient selective attention to the visual digits. However, there was a significant decrease in this difference as ITI increased ($p < .01$), indicating that selective attention efficiency increased as trials were increasingly separated. Findings are discussed in relation to selective attention formulations that have been developed primarily from studies of selective listening to 1 of 2 auditory inputs.—*Journal abstract*.

3402. Hockey, G. R. (U. Durham, England) **Changes in attention allocation in a multicomponent task under loss of sleep.** *British Journal of Psychology*,

1970(Nov), Vol. 61(4), 473-480.—Hypothesized that environmental treatments thought to change arousal in opposite directions (noise and loss of sleep) will also produce opposing changes in the degree of selectivity in attention allocation. A dual task method was employed where 12 17-23 yr. old male Ss performed a primary tracking task while simultaneously monitoring an array of light sources for occasional signals (the subsidiary task). The effect of loss of sleep was significant to impair performance of the primary task, and to reduce the advantage of high- over low-probability sources, within the subsidiary task, i.e., a loss of selectivity. This result complements that found in previous experiments with noise in which changes in attention allocation move in the opposite direction (an increase in selectivity), and supports the view that selectivity is a function of arousal level. (22 ref.)—*Journal abstract*.

3403. Hohmuth, Arthur V. (Trenton State Coll.) **Vigilance performance in a bimodal task.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 520-525.—Evaluated the need for an arousal construct in a theory of vigilance, as opposed to a theory based on a selective attention construct. Performance over time was examined in a situation involving 2 detection tasks, 1 in each of 2 modalities. 34 undergraduates were instructed to direct their attention to 1 of the 2 tasks, the primary task; the other task was of secondary importance. The main concern was in discovering whether the vigilance decrement would be specific to the primary task, as would be suggested by the selective attention theory, or whether it would be seen in both tasks, as suggested by the arousal construct. Data show that the decrement is task specific. However, it is not always the primary task which shows the decrement. It is argued that neither the construct of arousal nor that of selective attention is adequate, alone, to deal with the vigilance decrement. Results are discussed in terms of these 2 concepts and in terms of some practical implications for the design of real-life displays. (15 ref.)—*Journal abstract*.

3405. Sperry, R. W. (California Inst. of Technology, Div. of Biology, Pasadena) **An objective approach to subjective experience: Further explanation of a hypothesis.** *Psychological Review*, 1970(Nov), Vol. 77(6), 585-590.—Attempts to clarify a hypothesis of consciousness in which the phenomena of subjective experience are conceived to exert a direct causal influence on brain activity. Response is made to some questions posed by D. Bindra (see PA, Vol. 45:Issue 3) that arose from a recent statement by Sperry of the concept. The aim is to clarify where possible with material that supplements rather than repeats previous accounts, and the hypothesis is compared with other existing theories.—*Journal abstract*.

MOTOR PERFORMANCE

3406. Allen, John C. (U. Maryland) **The use of tactics in a psychomotor skill.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 375.

3407. Bartz, Douglas W. & Smith, Leon E. (U. Iowa, Motor Performance Research Lab.) **Effect of moderate exercise on the performance and learning of a gross motor skill.** *Perceptual & Motor Skills*, 1970(Aug), Vol.

31(1), 187-190.—Investigated the effect of a moderate standardized work load upon the learning of a gross motor skill. 10 nonexercised undergraduates performed 10 30-sec trials on a stabilometer, rested, and performed 3 additional trials. On the same apparatus 10 exercised Ss performed an initial exercise bout, in addition to exercise bouts between the 1st 10 30-sec trials. Results show that, although the exercised Ss had an elevated heart rate, performance throughout the learning trials and the retest trials did not differ significantly from that of nonexercised Ss.—*Journal abstract*.

3408. Jones, Marshall B. (Pennsylvania State U., Medical School) **Rate and terminal processes in skill acquisition.** *American Journal of Psychology*—After 16 trials of practice on micrometer adjustment, 200 airmen mastered the task, more or less; what little variance remains is error. However, the rate at which Ss approach this terminal level of near-perfection can be retarded by systematically transforming knowledge of results: the stronger the transformation, the longer it takes Ss to master the task. With no such transformation, correlations among early trials of practice showed strong superdiagonal patterning. As practice proceeded, this pattern weakened and then, around Trial 7, collapsed; the correlation level dropped near 0 and the matrix became disorganized. With progressively stronger transformations of knowledge of results, and in exact proportion as learning was retarded, the superdiagonal pattern persisted longer and longer into the practice series before it finally disintegrated. Results are interpreted in terms of a 2-process theory of individual differences in motor learning, based on the distinction between the level of proficiency an S approaches at the end of practice and the rate or route he follows in reaching it.—*Journal abstract*.

3409. Mikaelian, H. H. (Connecticut Coll.) **Adaptation to rearranged eye-foot coordination.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 222-224.—Investigated the generality of adaptation following 3 types of movements during prism exposure. 8 right-handed undergraduates with normal vision served as Ss. The 3 exposure conditions consisted of (a) walking with prisms, (b) viewing leg movements through prisms, and (c) viewing arm movements through prisms. Results show that changes in eye-foot coordination and egocentric localization occur following both a and b. Exposure conditions b and c both produce changes in eye-hand coordination; however, eye-foot coordination was found unaltered following c.—*Journal abstract*.

I. **Pribor dlya opredeleniya ustoiichivosti stoyaniya i opornykh reaktsii cheloveka.** [Instrument for determining the stability of standing and that of the postural reactions in man.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 281-288.—Presents a characteristic stabilogram and several basic parameters of

stabilographic variation in the human body.—I. D. London.

REACTION TIME

3412. Bernstein, Ira H., Rose, Robert, & Ashe, Victor M. (U. Texas, Arlington) **Energy integration in intersensory facilitation.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 196-203.—Conducted 2 experiments to explore facilitative effects obtained in visual RT when an auditory event occurs in close temporal proximity to the reaction signal. A particular model which assumes intersensory summation of stimulus intensity (energy integration) was tested with 2 male and 2 female undergraduates in Exp. I, and 4 adults in Exp. II. As predicted, the magnitude of the difference between visual and bisensory RT was directly related to auditory intensity and inversely related to visual intensity, although bisensory RT was inversely related to both intensities. The magnitude of the effect was approximately symmetric regarding temporal asynchrony in Exp. II, where the auditory event could either precede or follow the visual event. However, systematic deviations from symmetry occurred, related to other aspects of facilitation.—*Journal abstract*.
3413. Christ, Richard E. (Kansas State U.) **Some effects of stimulus-exposure time on choice-reaction time.** *American Journal of Psychology*, 1970(Jun), Vol. 83(2), 264-271.—86 undergraduates were run in 2 experiments investigating choice RT as a function of mixed and constant exposure time. Within the range of exposure times explored (50-150 msec.), conditions employing a constant exposure time did not differ from one another. However, when a series of short exposure times was mixed with a series of intermediate exposure times, the RT to both was increased. It is concluded that stimulus and S factors develop within the situation to produce effects that cannot be predicted from knowledge of only the stimulus-exposure conditions.—*Journal abstract*.
3414. Eichelman, William H. (U. Massachusetts) **Familiarity effects in the simultaneous matching task.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 275-282.—Designed 2 experiments to determine how familiarity affects the amount of time needed to decide whether 2 strings of letters are the same or different. Ss were 8 right- and left-handed undergraduates and 8 right-handed volunteers, respectively, with normal vision. In Exp. I, the RT for 2 words was compared to the RT for 2 random strings of letters. The number of letters/string was also varied. It was found that the familiar word strings could be compared more quickly than the random strings and that this difference increased as the number of letters/string increased. Exp. II determined if Ss were reading the word strings and processing their names. If this were true, it should make little difference if the strings to be matched were printed in different cases. However, a large difference between different-case and same-case stimuli was found for both random and word strings. Therefore, it is felt that familiarity with the stimulus material can affect stages of processing concerned with the physical characteristics of the stimulus.—*Journal abstract*.
3415. Greenwald, Anthony G. (Ohio State U.) **A choice reaction time test of ideomotor theory.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 20-25.—In 5 RT experiments, a total of 42 undergraduates and 10 6-yr-old children responded to auditory and visual letter or digit stimuli by speaking or printing the presented letter or digit. It was found that visual-written and auditory-spoken RTs were more rapid than expected on the basis of additive main effects of stimulus modality and response task. This finding had been derived as a prediction from the ideomotor hypothesis that performance of a voluntary action is mediated by an image of the action's sensory feedback. Explanations of the result that do not require the image concept are considered. (17 ref.)—*Journal abstract*.
3416. Kamlet, Arthur S. (Bell Telephone Lab., Whippany, N.J.) **Processing of sequentially presented signals in information-combining tasks.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1969(Jun), No. 9-69, 55 p.—Examined a special form of the 2-signal paradigm in which the 1st stimulus provided the rule or operator for defining the appropriate response to the 2nd stimulus. This form of the 2-signal experimental paradigm is called an information-combining task. Temporal factors in an information-combining task were examined to discriminate among alternative human performance theories. Specifically, the number of alternative operators and the number of alternative 2nd signals were independently varied over a range of intervals between the operator and the 2nd signal. In some tests the interstimulus interval was held constant from trial to trial; in other tests the interstimulus interval varied between successive trials. Results reject single-channel theories of information processing in favor of a flexible, capacity-sharing model. Results also suggest that Ss perform sophisticated strategy adjustments to take advantage of subtle features of these information-combining tasks. (82 ref.)—*Journal abstract*.
3417. Lefcourt, Herbert M. & Siegel, Jerome M. (U. Hawaii) **Reaction-time behaviour as a function of internal-external control of reinforcement and control of test administration.** *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 253-266.—Tested 168 undergraduates in 2 self- vs. E-controlled RT experiments. Ss with internal vs. external control of reinforcement expectancies were compared across these conditions. Internal-external proved to be irrelevant to condition effects, whereas sex of S proved important. Female Ss were quicker in self-directed conditions in both regular and irregular RT procedures, while always slower than males in general. When instructions were embellished to facilitate performance for a 3rd sample, external Ss did show some improvement. Data indicate support for previous research that has emphasized responsiveness of external Ss to E's structuring of tasks. External Ss seemed more affected by motivating directions especially in the other-directed condition, at the shortest preparatory interval. No clear-cut support, however, was found for the hypothesized interaction between internal-external and self- vs. other-controlled conditions. (French summary) (19 ref.)—*Journal abstract*.
3418. Simon, J. Richard & Craft, John L. (U. Iowa) **Effects of an irrelevant auditory stimulus on visual choice reaction time.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 272-274.—40 female undergraduates performed a unimanual choice RT task, pressing either a left or right button in response to the onset of a light which illuminated the button. In a predetermined random sequence of trials, the stimulus light was either presented alone or concurrently with a

monaural or binaural tone. The right response was facilitated by the tone to the right ear but inhibited by the tone to the left ear, while the left response was facilitated by the tone to the left ear, but inhibited by the tone to the right ear. RT on the binaural trials was faster than on the no-tone trials.—*Journal abstract.*

3419. Versteeg, Arlen. (U. Arizona) **Effect of a border on reaction time to onset and offset stimulation in the fovea.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 235-238.—Obtained RTs to the onset and offset of flash stimuli located in various positions in a visual field divided into 2 contiguous regions of white and black. Ss were 3 dark-adapted undergraduates. With presentation of the flash stimuli in the fovea, there were no significant differences in the character of functional onset and offset RTs or in the character of the function relating RT to distance from the border. There was a border effect operative for both functions; a decrease in both onset and offset RTs appeared as the border was approached from the white side and a slight increase in both onset and offset RTs when the border was approached from the black side.—*Journal abstract.*

LEARNING

3420. Beach, Lee R., et al. (U. Washington) **Probability learning: Response proportions and verbal estimates.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 165-170.—At various points in a 2-choice probability learning experiment, 121 undergraduates were interrupted and asked to estimate p , the probability of the more frequent of the 2 stimulus events. The Ss' estimates of p were compared with the proportion of trials on which other Ss predicted the events. These estimates imply that Ss learn the frequency of the 2 events much more rapidly than inferred from response proportions. The estimates change as a function of training in a manner consistent with a simple Bayesian revision model.—*Journal abstract.*

3421. Belica, Michael J. (Indiana U.) **Recognition learning from single- and multiple-channel presentations within the audio sensory domain.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 276-277.

3422. Bishop, Barbara R. (Florida State U.) **A comparison of learning efficiency and emotional concomitants in aversive stimulation and time-out from positive reinforcement.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5278.

3423. Breitman, Martin. (Yeshiva U.) **Organizational factors in intentional and incidental learning.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 407.

3424. Erickson, James R. & Block, Karen K. (Ohio State U., Human Performance Center) **Conditional response distributions in a multiple-choice probability-learning situation.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 328-330.—Presents conditional response distributions from a 16-choice probability-learning experiment. 60 undergraduates served for 800 trials each under 1 of 3 reinforcement distributions; rectangular, right triangular, or symmetrical triangular. Unlike Ss in experiments reported previously, there was no tendency for Ss in the present experiment to avoid predicting at the point of reinforcement on the previous trial (local negative recency). Rather, a form of

local positive recency was found. As in 2-choice experiments, negative recency in multichoice experiments is restricted to early trials in the sequence, or is due to artifacts in the experimental procedure or reinforcement schedule. The means of the conditional response distributions were linearly related to the point of reinforcement on the previous trial, as predicted by N. H. Anderson's information integration model, and by a variety of other models of linear form.—*Journal abstract.*

3425. Halford, G. S. & Davenport, W. G. (U. Newcastle, New South Wales, Australia) **An RTT experiment with two responses on each trial to a stimulus complex.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 203-211.—Applied tests for incremental and all-or-none learning in a situation with 65 undergraduates where each of 2 responses was equally reinforced with a stimulus complex consisting of 2 3-letter nonsense syllables. Learning was continued for 7 trials, and cases where Ss could give both correct responses were analyzed to see whether they occurred with separate nonsense syllables or with the same 1. It was found that when 2 responses were attached to a stimulus complex, both responses were elicited by each of the component stimuli. This result would not normally be predicted from a stimulus-response conception of learning, but is favorable to derivations from the expectancy theory of K. MacCorquodale and P. E. Meehl.—*Journal abstract.*

3426. Laszlo, Judith L. (U. Western Australia, Netherlands) **The role of visual and kinaesthetic cues in learning a novel skill.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 191-196.—Trained 18 medical students in a serial discriminative task under normal sensory feedback; with visual (+K-V) information loss; with kinaesthetic (-K+V) information loss. The performance curves over the 10 training sessions showed initial high decrement for -K+V; and somewhat less decrement for +K-V groups. All groups improved significantly, the information loss groups reaching the same final performance level. In Test I (normal feedback), the groups performed at equal levels. It is proposed that sensory information during the practice of a new skill influences performance rather than learning. Results in Test II, where feedback channels available to Ss differed from those utilized during training, support the hypothesis of the dependence of skilled task on the modality utilized during training.—*Journal abstract.*

3427. Restle, Frank. (Indiana U.) **Theory of serial pattern learning: Structural trees.** *Psychological Review*, 1970(Nov), Vol. 77(6), 481-495.—When undergraduates learn patterned sequences, they divide them into subparts. Each subpart has the property that it can be generated unambiguously by simple rules. Such a rule system consists of E, the set of elements or events forthcoming, and I, the set of intervals leading from 1 event to the next. Parts or their generating rule systems can be the elements of higher order rule systems. This produces the recursive E-I theory. 1 part is generated from another by any of a class of transitions such as repeating, transposing, or inverting. By applying such transitions as compound functions, one generates structural trees, which give a particularly simple account of certain regular patterns. Experimental results show that the difficulty of learning a transition within such a pattern depends on how high it is in the tree. The theoretical results are applied to the theory of music.—*Journal abstract.*

3428. Saltz, Eli. (Wayne State U.) **Manifest anxiety: Have we misread the data?** *Psychological Review*, 1970(Nov), Vol. 77(6), 568-573.—An examination of the research literature suggests that the data on the relationship between manifest anxiety and learning has been misread. A more defensible theory appears to be that the persons who score as high anxious are those who show disrupted behavior under failure-induced stress, but not necessarily under pain-induced stress; persons who score as low anxious are those who show disruption under pain-induced stress, but not necessarily under failure. This position accounts for most of the conditioning and verbal learning data published to date. (25 ref.)—*Journal abstract*.

3429. Scandura, Joseph M. (U. Pennsylvania, Graduate School of Education) **Role of rules in behavior: Toward an operational definition of what (rule) is learned.** *Psychological Review*, 1970(Nov), Vol. 77(6), 516-533.—Proposes a precise formulation of the notion of a rule in terms of sets and functions. It is argued that this molar formulation cannot be captured by networks of associations unless one allows associations to act on (other) associations. This formulation is then used as a basis for showing how rules are involved in decoding and encoding, symbol and icon reference, and higher order relationships. Decoding and encoding are shown to involve insertion into and extraction from classes, respectively. Reference is viewed in terms of rules which map equivalence classes of signs into the classes of entities denoted by these signs. Symbols are shown to involve arbitrary reference, whereas icons retain properties in common with the entities they denote. Higher order relationships are then expressed as higher order rules on rules. This is a direct generalization of associations on associations. Finally, a partial solution is posed to the problem of what (rule) is learned. Given a rule-governed class of behaviors, what is learned is defined as the class of rules which provides an accurate account of test data. Empirical evidence is presented for a simple performance hypothesis based on this definition. (38 ref.)—*Journal abstract*.

3430. Simpkins, Ruth E. (Rider Coll.) **Verbal performance effected by social and material reinforcements.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 268-271.—Investigated the effects of 2 levels of social and material reinforcement on the verbal performance of 104 male undergraduates who were divided into impulsive and nonimpulsive groups by paper-and-pencil tests. A Taffel-type verbal conditioning task was used. Following preliminary instructions given to Ss in person, all further interaction took place with E in an adjoining control room. Social reinforcement involved prerecorded comments: "mm-hm" or "ok" for weak; "good," "that's good," "very good," "excellent," or "fine" for strong. The material reinforcement was either 2¢ (weak) or 15¢ (strong). Thus the design was a 2x2x2 factorial for type of reinforcement, intensity, and level of impulsivity. Only data from aware Ss were included in the analysis. Material reinforcement was more effective than social reinforcement for all blocks of reinforced trials ($p < .01$). There were no significant effects for intensity or impulsivity. Results are discussed in terms of awareness of the response-reinforcement contingency and differential valuation of incentives. (15 ref.)—*Journal abstract*.

3431. Singer, Robert N. & Witker, Janet. (Michigan State U.) **Mental rehearsal and point of introduction**

within the context of overt practice. *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 169-170.—Placed 65 female undergraduates in 1 of 5 groups to learn the pursuit-rotor task. 4 of the groups practiced mentally at various designated points during the overt practice context; the 5th practiced without any directed mental rehearsal. Using various statistical analyses, no significant differences were found between the groups, although a trend indicated some value of early introduction of mental rehearsal within the context of overt practice.—*Journal abstract*.

3432. Spiker, Charles C. (U. Iowa, Inst. of Child Behavior & Development) **An extension of Hull-Spence discrimination learning theory.** *Psychological Review*, 1970(Nov), Vol. 77(6), 496-515.—Proposes 2 modifications in the basic axioms of Hull-Spence discrimination learning theory. The principle of primary stimulus generalization is changed from an exponential to a linear function for both habit and inhibition. The principle of stimulus interaction is substituted for the additive axiom used by Spence and for the principle of afferent neural interaction proposed by Hull. With these 2 modifications, and other principles in the theory, prediction equations are derived for several types of problems involving discrimination learning and transfer. The modified theory is shown to predict that successive, conditional reaction, and mixed simultaneous-successive problems can be learned. There is also an illustration of the way in which response-produced cues can be quantitatively incorporated into the theory. Finally, a method is described for obtaining maximum likelihood estimates of the parameters in the prediction equations. A generally favorable evaluation of the theory results from a comparison of its predictions with the outcomes of some 2 dozen experimental studies. (38 ref.)—*Journal abstract*.

3433. Tsao, Yao-chung. **The generalization and discrimination of stimulus-weight learning.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 155-164.—4 groups of Ss were instructed to press a key in a quick motion to a 3.5-cm displacement, upon seeing a light after hearing a sound. Sounds were paired with weights. After 25 training trials, there were 2 testing trials and 3 additional training trials. Results suggest that discrimination learning is established during the 25 training trials, and that there is a tendency of generalization during the 2 test trials which is not statistically significant. Results agree with Hull's stimulus intensity dynamism which hypothesizes that the stronger CS invokes the stronger CR.—*Journal abstract*.

3434. Turner, C. & Mackintosh, N. J. (U. Edinburgh, Scotland) **Continuity theory revisited: Comments on Wolford and Bower.** *Psychological Review*, 1970(Nov), Vol. 77(6), 577-580.—Critically examines the suggestion made by G. Wolford and G. H. Bower (see PA, Vol. 44:2077) that K. W. Spence's theory of discrimination learning can predict an overlearning reversal effect (ORE). The prediction depends on a choice of parameter values representing strong initial preferences for 1 or the other position, or for S-. Experimental evidence with 20 stat-rats shows that such preferences are not a necessary condition for the occurrence of an ORE. Even if the model could predict an ORE under other conditions, the basis for the prediction would be the existence of a strong correlation between position habits in acquisition and reversal, which does not exist.—*Journal abstract*.

Conditioning

3435. Gendreau, Paul, et al. (Queen's U., Kingston, Ontario, Canada) **Effect of two days' monotonous confinement on conditioned eyelid frequency and topography.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 291-293.—Compared conditioned discriminative eyelid response frequency and topography for 9 volunteer prisoners before, immediately after, and 2-7 days following 2 days of monotonous confinement. Monotonous confinement did not enhance learning over control readings; however, it may have a selective effect on individual differences and conditioning.—*Journal abstract*.

3436. Kuo, Shang-wu. **Effects of contextual activity in conditioning of voluntary response.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 144-154.—Studied the conditioning of a voluntary response in 164 Ss by arranging a tone and a light, respectively, as CS and UCS with an interstimulus interval of 200 msec. Control groups were instructed to complete key-pressing response to the UCS. Experimental groups had to press or let go of the key with prescribed amounts of force or work in response to the CS and then complete the response to the UCS as did the control groups. 2 test trials were run for all groups except Group 2. It was found that more and larger CRs were obtained in the experimental groups on both of the test trials. Results obtained on the 2nd test trials were more or less smaller than those obtained on the 1st.—*Journal abstract*.

3437. Meyer, Philip A. (U. South Dakota) **Role of an unavoidability procedure in eliminating avoidance behavior with humans.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 337-340.—Recent theoretical emphasis on response-contingent omission of the noxious stimulus (NS) as the major source of reinforcement for an avoidance response (AR) suggests an extinction procedure where the NS is unavoidable. The NS is presented on all extinction trials. 44 undergraduates stopped making ARs, which had prevented air blasts delivered behind the ear, faster with an unavoidable NS than with the NS omitted on all extinction trials, but slower than with punishment. In Exp. II, 4 groups received the unavoidability procedure in extinction, but the contingency whereby an AR either terminates the signal or not, varied in training and extinction. The 2 groups for which the signal termination contingency changed from training to extinction showed the most differences during extinction with an unavoidable NS. Avoidance latencies were longer during the unavoidability procedure than in training.—*Journal abstract*.

3438. Miller, Adam W. & Babcock, Bonnie B. (St. Cloud State Coll.) **The operant conditioning of awareness.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 169-177.—Investigated verbal operant conditioning and higher-order conditioning of meaning, their relationship to awareness, to operant conditioning of awareness statements, and to the controlling function of instructions. 90 undergraduates were studied individually. Their task was to learn for each of 4 nonsense syllables 3 correct word associates and a related awareness statement. In a 3×3 factorial design 3 kinds of awareness statements were reinforced and 3 levels of instructions were used. The findings were: Awareness statements operantly conditioned. The degree of operant conditioning of associates and of awareness statements

was predictably varied so they occurred together or independently. Higher-order conditioning of meaning occurred and was predictably varied in its relationship to awareness. Awareness statements during conditioning and questionnaire measured awareness were related.—*Journal summary*.

3439. Vogel-Sprott, M. (U. Waterloo, Ontario, Canada) **Resistance to extinction in human subjects: Learning informative properties of a blank trial.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 241-245.—Trained 60 undergraduates to respond to "good" or "bad" visual signals as reward or punishment. Training groups received either (a) consistent reward (CR₊) for the correct response and blank, i.e., no signal, for all wrong responses; (b) partial reward (PR₊) for the correct response, blanks occurring with some correct and all incorrect responses; or (c) blanks (CP) for all correct responses, with consistent punishment of wrong responses. 1/2 of the Ss from each training group received extinction (blank trials) immediately following acquisition. The discriminable onset of extinction was controlled for the remaining Ss by preceding extinction with a set of trials in which every response received either reward or punishment. PR₊ and CP training both led to more persistence in extinction than CR₊, even when discrimination was controlled. Consecutive repetitions of the correct response during extinction suggests that the CP procedure developed a resistance to deviation beyond that obtained from PR₊. The evidence is consistent with the view that S learns the predictive properties of a blank trial and this learning mediates behavior in extinction.—*Journal abstract*.

3440. Wiegand, Dennis B. & Rodwan, Albert S. (DePaul U.) **A test of the preparatory response theory by measurement of increased stimulus attractiveness following a signal.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 225-229.—Measured the enhancement effect on the attractiveness of a visual stimulus (UCS) following advanced information (CS), as proposed by the preparatory response theory. 3 CS durations of 1, 3, and 10 sec. were combined with high and low UCS intensity. 60 male undergraduates were assigned randomly to the 6 experimental conditions and rated the attractiveness of photographs of females (UCS). The predicted enhancement effect following information was found in all treatment conditions, with its strongest occurrence in the group with the high-intensity UCS and the 10-sec CS. No overall increase in the enhancement effect as a function of the number of trials occurred, contrary to expectation. Results support a preparatory response interpretation for the value of noninstrumental information. (15 ref.)—*Journal abstract*.

3441. Worrall, Norman. (Hatfield Polytechnic, England) **Differential GSR conditioning of true and false decisions.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 13-19.—Used a series of questions to demonstrate differential conditioning of the GSR to decisions to give true or false answers to the questions. Following a mock theft, 20 personality inventory-type questions were asked, to any 5 of which undergraduate Ss were required to give a deliberate false answer. An experimental group (N = 60) had shock paired with each false answer, while control groups experienced either random shock (N = 60) or no shock (N = 60) at all. The GSR under examination appeared to have 2 components, 1 occurring several sec. before the overt answer and 1 approximately coinciding with the answer.

The experimental group showed differential conditioning in the amplitude of this response complex for true-false answers, and the effect showed transfer to specific test questions about objects possibly taken during the mock theft. Group differences were maintained in the generalization and extinction data. Results are discussed in terms of whether the paradigm is best regarded as mediational, classical, or instrumental.—*Journal abstract.*

Verbal Learning

3442. Carlson, Hilmer J. (U. North Dakota) **Verbal conditioning rates and awareness as a function of reinforcement value and informational aspects of verbal reinforcers.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 390.

3443. Dey, Mukul K. (McMaster U., Hamilton, Ontario, Canada) **Experimental extinction of verbal associative responses.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 193-200.—Using the design normally employed to study retroactive inhibition, the variables of interval between reinforced practice and retest and of extended practice without reinforcement vs. rest during the interval were factorially combined. Ss were 36 male and 36 female undergraduates. Nonreinforcement significantly decreased the frequency and increased the latency of correct responses in comparison with the condition of rest; the magnitude of this effect was greater under massed than under distributed stimulus presentation. These evidences of experimental extinction of verbal associative responses uphold the unlearning theory of retroactive inhibition and the wisdom of applying conditioning principles in the interpretation of verbal learning. (20 ref.)—*Journal abstract.*

3445. Kanak, N. Jack & Curtis, C. Dwayne. (U. Oklahoma) **Unlearning of context-item and specific associations in the W₁-R₁, W₂-R₂ paradigm.** *American Journal of Psychology*, 1970(Jun), Vol. 83(2), 256-263.—Ss were 48 naive undergraduates. Bidirectional modified free-recall data revealed significant unlearning of context-W (wrong item) and context-R (right item) associations, compared with both a control group that recalled immediately after List 1 practice and a normal forgetting control group that recalled List 1 after working on a neutral interpolated task. Also, an associative-matching task indicated that Ss also experienced unlearning of specific, incidentally learned, W-R/R-W List 1 associations. Results represent an extension to verbal-discrimination learning of recent paired-associate studies that demonstrated unlearning of specific and context-item associations in the A-B, C-D paradigm.—*Journal abstract.*

3446. Wollen, Keith A. (Washington State U.) **Effects of set to learn A-B or B-A upon A-B and B-A tests.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 186-189.—Assessed the importance of learning set upon forward and backward learning by factorial combinations of set to learn (A-B vs. B-A) and direction of testing (A-B vs. B-A) with 96 undergraduates. Although there were no differences among the 4 groups in terms of frequency correct, latency differences were

obtained. Forward latencies were shorter than backward latencies for correct responses but not for errors. Learning set exerted no influence on either frequency or latency.—*Journal abstract.*

Verbal Paired Associate Learning

3448. Deshpande, S. W. **Reassessment of meaningfulness of some CVC trigrams.** *Journal of the Indian Academy of Applied Psychology*, 1969, Vol. 6(2), 57-60.—The correlation coefficient between the observed percentages of Glaze and Krueger was higher than those observed in the present study, with Glazer and other Indian studies suggesting a necessity for new norms for an Indian sample.—*U. Pareek.*

3449. Dey, Mukul K. (McMaster U., Hamilton, Ontario, Canada) **Influence of the sequence of similar stimuli on paired-associate learning.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 255-265.—2 groups of Ss (N = 40 male volunteer undergraduates) received practice on a paired-associate list composed with several groups of similar stimuli through 2 sessions separated by a brief rest. The similar stimuli were presented in a random (R) sequence to Group R-R all along but first in clusters (Cs) and then in a random sequence to group C-R. The latter group showed superior performance before but inferior performance after the rest in comparison with the former. This finding suggests that the clustering of similar paired-associate stimuli retards learning but facilitates performance.—*Author abstract.*

3450. Fletcher, Faye M., Etaugh, Claire F., & Reid, Larry D. (Bradley U.) **Paired-associate analogue of language learning: Role of reinforcement, repetition, and number of rule instances.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 319-325.—Taught 16 adults 25 paired associates, forming a 5 × 5 matrix, in which the stimuli were 2-digit numbers and the responses were 2-letter pairs; 23 pairs (regulars) followed matrix rules; 2 pairs (irregulars) did not. On study trials, Ss were presented 21 regular pairs once and 2 irregular pairs twice; test trials were with all 25 stimuli. Ss learned the pairs more rapidly than those in a similar study which used fewer pairs and a smaller matrix. Ss receiving verbal reinforcement for correct responses on test trials performed no better than Ss not reinforced. Ss receiving both verbal reinforcement and repetition of correct responses on test trials learned fastest. Performance on irregular pairs was initially better than on regular pairs. Errors on the irregulars involved generalization of regular responses.—*Journal abstract.*

3451. Kanak, N. Jack & Neuner, Sharon D. (U. Oklahoma) **Associative symmetry and item availability as a function of five methods of paired-associate acquisition.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 288-295.—80 undergraduates learned a paired-associate list of 8 pairs of familiar words by 1 of 5 methods of acquisition, varying in terms of whether the A and B components of a pair involved a recall process, both a recognition process, or 1 component a recognition process and the other a recall process. Learning by the anticipation method and a

study-test method involving recall of both items on paced test trials required more trials than the traditional recall method or a recognition-discrimination condition. Comparisons of the anticipation and recall methods on several other measures indicate that the inferiority of the anticipation method was attributable to a slower rate of development of reliable associative strength or, alternatively, to a higher confidence threshold on the part of anticipation Ss. Associative symmetry was demonstrated in the conditions which involved only recall or only recognition processes, while 3 conditions which mixed recall and recognition processes yielded asymmetry favoring superior recall for the item involving a recall process. Items learned by recognition, whether A or B items, were significantly less available than items learned by recall. (20 ref.)—*Journal abstract.*

3452. Laurence, Mary W. (U. Toronto, Ontario, Canada) **Role of homophones in transfer learning.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 1-7.—2 experiments examined the role of homophones as elements in transfer learning. Exp. I with 100 19-27 yr. old Ss showed positive transfer between 2 paired-associate (P-A) lists provided that homophones of response items in List 1 served as response terms in List 2, and that no re-pairing of items had occurred. When stimulus and response terms were re-paired, negative transfer was observed. An acoustically based, spelling-translation stratagem applicable to the same-order but not to the re-paired lists is suggested as accounting for the differential results. Exp. II with 60 undergraduates examined transfer between 2 identically ordered free recall lists of homophones. The acoustic identity between lists facilitated List 2 learning on Trial 1 only, but thereafter led to negative transfer. Results are interpreted to support E. Tulving's view that subjective organization developed in the course of List 1 learning was inappropriate to and interfered with List 2 learning.—*Journal abstract.*

3453. Miller, Stuart. (Towson State Coll.) **Prediction of mediated paired-associate learning.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 131-132.—Gave 100 undergraduates either associative or recall instructions in a compound free association test. The percentage of the most popular response was then used to predict the number of correct responses in paired-associate learning of the compounds. Only associative instructions was significantly related to learning ($p < .01$). A mediational interpretation of the results is offered.—*Journal abstract.*

3454. Nelson, Douglas L., Peebles, Jerry, & Pancotto, Frank. (U. South Florida) **Phonetic similarity as opposed to informational structure as a determinant of word encoding.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 117-119.—Each of 200 Ss acquired 1 of 10 paired-associate lists in which 6-letter words served as stimuli and single digits as responses. Words within 9 of the lists shared letters in Positions 1, 2, . . . , 6 or Positions 1 and 2, 3 and 4, or 5 and 6. The 10th list served as a low-similarity control. Results indicate that a reduction in the distinctiveness of initial and, to a lesser extent, of terminal portions increases difficulty of acquisition to a greater extent than reductions in the saliency of medial portions. Findings are interpreted as consistent with the hypothesis that the words, in this task, were coded as phonological serial sequences and not in terms of their informational structure.—*Journal abstract.*

3455. Wright, John H. & Gescheider, George A. (Hamilton Coll.) **Effects of stimulus similarity on paired-associate learning under immediate and delayed knowledge of results.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 181-186.—102 undergraduates learned by an anticipation procedure a single 8-pair paired-associate (PA) list of either high or low similarity among PA stimuli under 1 of 3 conditions of delay of knowledge of results (KR) produced by separating systematically within each trial the presentation of the stimulus terms for testing from subsequent presentation of the respective stimulus-response pairs for response confirmation and further learning. The finding of considerably better PA performance under immediate than under delayed KR indicates that the learning of verbal PAs by an anticipation procedure is adversely affected by delay of KR. The magnitude of the superiority of performance under immediate KR was considerably greater in learning the PA list of high stimulus similarity than in learning the PA list of low stimulus similarity. This finding supported the hypothesis that 1 of the functions of immediate KR in verbal PA learning is to minimize or reduce the detrimental effects of intralist interference.—*Journal summary.*

Reinforcement

3456. Clance, Pauline R. (U. Kentucky) **The effects of different reinforcement-punishment contingencies upon the occurrence of aggressive behavior.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 390-391.

3457. Dixon, Paul W. & Hammond, Sharon. (U. Hawan, Hilo) **Operant conditioning of spoken phonemes /s/ and /z/ and awareness.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 87-92.—4 groups of 15 undergraduates each selected 1 of 2 nouns and gave its plural when it was presented on a 3 × 5 in. index card. Each S was then given a postconditioning interview. 15 Ss were reinforced by the word good for choosing nouns whose plurals were formed by adding the voiced alveolar fricative /z/. 15 were reinforced for choosing plurals formed by adding the unvoiced alveolar fricative /s/. The other 2 groups were used as /s/ and /z/ controls. Both reinforced groups showed significant conditioning effects when compared with their controls with no significant interaction between reinforcement and phoneme response class. Ss showed a preference for /z/ as compared to /s/ plurals at a statistically significant level. A comparison of conditioning scores for those who were aware of the reinforcement good and also those who were not aware of any reinforcement was made with those who were aware of a correlated or correct reinforcement response contingency. Greater awareness produced significantly greater conditioning, indicating that conditioning effects are related to a postconditioning interview even in a reinforcement response contingency which is not easily discriminable.—*Journal abstract.*

3458. Mandell, Elizabeth E. (U. South Carolina) **An investigation of the effects of partial reinforcement on extinction employing augmented knowledge of results as reward.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 417.

3459. Wang, May J. **Experiments of variables confounding with percentage of reinforcement in concept learning.** *Acta Psychologica Taiwanica*,

1968(Mar), Vol. 10, 105-119.—Studied concept learning with partial or continuous reinforcement, and reinforcement for placement or reason. 80 Ss placed cards right or left and were reinforced for placements. Another group of 40 Ss placed cards right or left and gave trial by trial reasons and were reinforced for reasons. In Exp. I during acquisition, $\frac{1}{2}$ of the Ss received 100%, and $\frac{1}{2}$ 50% reinforcement until each reached 50 trials. In Exp. II during acquisition, $\frac{1}{2}$ received 100% and $\frac{1}{2}$ 50% reinforcement until each reached 100 trials. The reasons for placement were odd numbers of figures per card to the left, and cards with even numbers of figures to the right. The shifting period had 100 trials with 100% reinforcement, and the reasons for placement were shifted to color. In acquisition and shifting periods, the partial reinforcement effect (PRE) was found. Reinforcement for reason was superior to reinforcement for placement in performance. In both acquisition and shifting periods, with reinforcement contingent on either verbal or motor responses, the PRE could be found in concept learning. It was also found to be sustained through blocks of continuous reinforcement. The shifting condition is analogous to an extinction condition.—*Journal abstract.*

MEMORY

3460. Briggs, George E. & Swanson, James M. (Ohio State U., Human Performance Center) **Encoding, decoding, and central functions in human information processing.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 296-308.—Examined speed and accuracy in an information-reduction task in 2 experiments with 48 undergraduates. RT was a linear function of central processing uncertainty (H_c), $RT = A + B (H_c)$; A was decomposed into components relating to initial encoding time, to input sampling time (the Sperling SCAN function), and to response decoding time; B was decomposed into components relating to retrieval time from long-term memory and to central comparison time. The empirical constants of additivity of RT were consistent between the 2 experiments and with those from previous research.—*Journal abstract.*

3461. Clifton, Charles & Birenbaum, Steven. (U. Massachusetts) **Effects of serial position and delay of probe in a memory scan task.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 69-76.—In a task in which 12 13-15 yr. old girls indicated whether a probe digit was a member of a previously seen list, the effect of the position of the probed item in the list upon the speed of correct "yes" responses was studied by factorially varying the number of digits that preceded and the number that followed the probed item in the list. Such responses were found to be faster when the probed item came near the end of the list, provided that the probe was presented within .8 sec. after the end of the list. Ancillary findings show that: (a) while the functions relating RT to the length of the memorized list were primarily linear increasing, minor but reliable deviations from linearity were noted for "yes" responses at list lengths 1 and 2; and (b) while 9 Ss showed parallel functions relating RT to list length, 3 Ss showed functions for "no" responses that were twice as steep as their functions for "yes" responses.—*Journal abstract.*

3462. Colegate, Robert L. & Eriksen, Charles W. (U. Illinois) **Implicit speech as an encoding mechanism in visual perception.** *American Journal of Psychology*,

1970(Jun), Vol. 83(2), 208-215.—Anticipated that 12 undergraduates using 1-syllable responses could encode more information from a rapidly decaying icon than those using 3-syllable responses. 3 or 6 nonsense forms were simultaneously presented in a tachistoscopic exposure. 1 group of Ss had previously learned 1-syllable names for the nonsense forms; and another group, 3-syllable names. At temporal intervals after termination of the display that were too long for iconic storage to persist, a probe designated the location of 1 of the elements in the display and S reported what nonsense form had been in this location. The 1-syllable response group was found to have encoded significantly more information from the display. However, the superiority of the 1-syllable response group was not as large as would be expected from the differences in duration of implicitly speaking a 1- as opposed to a 3-syllable response.—*Journal abstract.*

3463. Dainoff, Marvin J. (Miami U.) **Time course of visual and auditory encoding.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 214-224.—Using a Posner-type RT procedure 8 undergraduates responded "same" or "different" to visually presented letter pairs. Onset of the 2nd letter, relative to the 1st was delayed 0, 1125, 1500, or 2000 msec. Pair members were printed in either upper- or lowercase type, and selected from a population of either auditorily confusable or nonconfusable letters. Results show that RT was faster when S compared physical forms of letters (e.g., BB) than names of letters (e.g., Bb), but that this difference decreased with delay. Further, when names were compared, RT was longer for auditorily confusable names, and this effect increased with delay. These observations support a model in which the likelihood of auditory encoding increases over time, whereas maintenance of a visual code decreases. (35 ref.)—*Journal abstract.*

3464. Epstein, William. (U. Wisconsin) **Facilitation of retrieval resulting from post-input exclusion of part of the input.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 190-195.—In a former study, on each of 8 trials, W. Epstein (see PA, Vol. 44:207) presented a different pair of lists and S was instructed to memorize both lists. On each trial, the recall cue, given after the last item, solicited recall of only the 1st or 2nd list, or recall of both lists. Epstein found that recall of the only list was superior to recall of the list as the 1st of 2 lists on a both trial. The current experiments studied the generality of this effect with 64, 40, and 80 undergraduates, respectively. Exp. I compared presentation of the 2 lists in different modalities (auditory and visual), with presentation in a single modality (visual or auditory). Exp. II examined the effect with pairs of word lists rather than word lists paired with number lists. Exp. III varied rate of presentation and response mode. Superior only recall was observed in all 3 experiments. Exp. III suggests that the only effect is greater when both lists are presented in the same modality.—*Journal abstract.*

3465. Fozard, James L. (Veterans Administration Outpatient Clinic, Boston, Mass.) **Apparent recency of unrelated pictures and nouns presented in the same sequence.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 137-143.—Regularly interrupted a long inspection sequence consisting of single unrelated pictures and nouns with questions in which 42 undergraduates and instructors chose the more recently presented of the 2 items shown in the question. In $\frac{1}{2}$ of

the questions, the stimuli closer to and farther from the question in which they were being compared were both pictures or nouns; in the other $1\frac{1}{2}$, 1 was a picture, the other a noun. From best to poorest, accuracy of choice of the more recently presented item was: 2 pictures, nearer picture and farther noun, 2 nouns, and nearer noun and farther picture. Data support the hypothesis that judgments of recency for the 2 classes of stimuli differ in both average location and variability on a subjective continuum.—*Journal abstract.*

3466. Hall, James W. & Kozloff, Edward E. (Northwestern U.) **False recognitions as a function of number of presentations.** *American Journal of Psychology*, 1970(Jun), Vol. 83(2), 272-279.—Presented a list of words visually to 160 undergraduates who indicated whether each word had or had not appeared earlier on the list. Late in the list were associates of those critical stimulus words that had appeared earlier, either 1, 3, 5, or 7 times. The frequency of false recognition of the associates 1st increased, then declined, as a function of the number of times their corresponding critical stimulus words had occurred, and was greater than that for nonassociates of previously appearing words. Results are considered in terms of a 2-stage recognition model wherein the perceived situational frequency of a word is critical in the recognition decision.—*Journal abstract.*

3467. Kennedy, R. A. & Wilkes, A. L. (U. Dundee, Scotland) **A comparison of retrieval and location operations in active and passive sentences.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 491-498.—Obtained data from 96 undergraduates on either location (indicating presence or absence of probe words) or retrieval (responding to probe words with the next word) for both active and passive sentence examples. Ss were timed to respond in both tasks. The resulting latency profiles were compared and the relative contribution to these of surface structure and semantic features was assessed. In the location profiles, fast, medium, and slow positions were isolated and found to be associated with semantic function in both the active and passive sentences. In the retrieval profiles structural factors to a large extent predicted the latencies obtained. Differences between active and passive forms were more evident in location than in retrieval.—*Journal abstract.*

3468. Massaro, Dominic W. (U. Wisconsin) **Perceptual processes and forgetting in memory tasks.** *Psychological Review*, 1970(Nov), Vol. 77(6), 557-567.—Presents a quantitative model of the effects of perceptual processing on memory. It is assumed that memory for an item is directly related to the processing of that item and inversely related to the processing of other items, and that the amount of perceptual processing decreases during the temporal course of item presentation. Therefore, rate of forgetting is not constant with respect to the retroactive duration or the number of interpolated items. It is shown that increasing the rate of presentation of a list of items not only decreases the perception of the items, but also decreases the rate of forgetting when measured against the number of retroactive items. The theory provides an adequate description of several memory studies using both verbal and nonverbal items. (30 ref.)—*Journal abstract.*

3469. Mills, John A. & Winocur, Gordon. (U. Saskatchewan, Saskatoon, Canada) **Reminiscence in connected discourse.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 209-215.—Reports 3 experiments on the reminiscence of highly meaningful connected

discourse learned by the serial rote anticipation method using a retention interval of 10 min. It was shown that such reminiscence as was obtained could not be explained by the maintenance of set during the rest interval but by rehearsal. A subsidiary experiment showed that rehearsal did not prevent forgetting over a 24-hr interval.—*Journal summary.*

3470. Moulton, Alan E. (U. Kentucky) **The effect of manipulation of motive-incentive variables in acquisition on the retention of verbal material.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 419.

3471. Murch, G. M. & Albert, D. (Portland State Coll.) **All-or-none vs. incremental learning in verbal free recall.** *Archiv für die gesamte Psychologie*, 1968(Aug), Vol. 120(1), 115-124.—Compares an all-or-none and an incremental explanation of the learning process in verbal free recall with 100 undergraduates. The factor of the subjective level of learning difficulty for the stimulus materials used was kept under control by having each S, prior to the main experiment, rate the syllables (CVC) as to their levels of learning difficulty. In Group I, syllables being correctly reproduced were replaced by new syllables rated as having the same level of learning difficulty by the individual S. The same procedure was used for Group II with the addition that those syllables being in part correctly reproduced were also removed. In the control condition new lists were presented on each of the 12 trials. Results indicate a greater number of syllables reproduced for Group I than for Group II and the control. It is concluded that an all-or-none description of verbal free recall is inadequate. (French & German summaries) (17 ref.)—*Journal summary.*

3472. Sussman, Harvey & Smith, Karl U. (Wisconsin U., Behavioral Cybernetics Lab.) **Sensory-feedback persistence in determining memory.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 503-508.—Investigated sensory feedback persistence as a factor in determining memory by varying the display persistence of both a to-be-learned stimulus pattern and a memory-reproduction stimulus pattern, and then measuring the effects of this variable feedback persistence on reproduction of the stimulus-wave pattern. A hybrid computer system regulated aspects of feedback control of the motor-sensory factors in the learning and memory procedures and measured error in the dynamic memory tests. Results specifically confirm the hypothesis that spatial factors in learning, as produced by persistence of a visually tracked pattern, function as time-spanning processes to encode time in memory and thus to make possible feed-forward projection and prediction of behavior on a space-time basis. Findings support the view that learning and memory are interrelated time-spanning and space-time projection processes in behavior, and govern the sense of time in the past and future rather than being determined by factors of time contiguity and temporal association of separate discrete responses.—*Journal abstract.*

Short Term & Immediate Memory

3473. Anisfeld, Moshe. (Yeshiva U.) **False recognition of adjective-noun phrases.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 120-122.—60 15-27 yr. old Ss judged each of 154 phrases, presented aurally at a 4-sec rate, on a scale ranging from

1 (definitely new, i.e., it had not appeared earlier in the list) to 4 (definitely old). They made more false recognition errors (i.e., 2-4 responses) to phrases (e.g., fat book) synonymous with preceding phrases (thick book) than to control phrases (history book), but the difference between antonymous phrases (thin book) and the control phrases was not significant, even though the antonymous adjectives were also common associates of the preceding adjectives. The absence of an antonymous effect for phrases contrasts with findings showing the presence of an effect for antonymous words. It is suggested that phrases, because they are propositional entities and have relatively determinate meaning, arouse primarily referential reactions, i.e., they are mainly coded not for their form but for their substance. Synonymous phrases share similar referents and are therefore somewhat indistinguishable in memory, but the referents of antonymous phrases are quite different.—*Journal abstract.*

3474. Archer, Barbara U. & Margolin, Robert R. (U. Rhode Island) **Arousal effects in intentional recall and forgetting.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 8-12.—Studied effects of white-noise-induced arousal upon intentional remembering and forgetting using 2-digit numbers as stimuli, followed 3 sec. later by the instruction "remember it" or "don't remember it." 16 stimuli (8 in conjunction with white noise and 8 without) were presented to 24 male and 24 female undergraduates. For $\frac{1}{2}$ of the Ss, the noise, when it occurred, was presented just prior to the stimulus, while for the remaining Ss, noise occurred after the stimulus but prior to instructions. Significantly more remember items were recalled than don't-remember items. White noise had no effect on intentional forgetting, but did produce significant facilitation of recall of remember items, and that facilitation was significantly greater for men than for women. A significant difference did not result for the temporal point of noise introduction.—*Journal abstract.*

3475. Brehmer, Berndt & Lindberg, Lars-Åke. (U. Umeå, Sweden) **Retention of probabilistic cue-criterion relations as a function of cue validity and retention interval.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 331-334.—Studied retention of a probabilistic cue-criterion task with scaled cue and criterion variables in a 3×2 factorial experiment with 3 levels of cue validity; .45, .70, and .90; and 2 retention intervals, immediately after the completion of the learning stage, and 1 wk. later. The retention tests were performed without feedback with 54 undergraduates. Response consistency was higher in the retention tests than in the learning stage, due to (a) an increase in extremeness of Ss' predictions, and (b) a decrease in the variability in their response systems. There was no change in the Ss' behavior over the 1-wk interval. The increase in consistency in the retention tests is interpreted to be an effect of the omission of feedback, rather than of forgetting.—*Journal abstract.*

3476. Elmes, David G., Adams, Carl, & Roediger, Henry L. (Washington & Lee U.) **Cued forgetting in short-term memory: Response selection.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 103-107.—4 experiments used a running paired-associate task to investigate the effects of cueing Ss to forget items presented prior to a critical pair and to determine how Ss forget irrelevant information. Cueing Ss to forget prior information was effective when the list presentation times were equivalent for cued ($N = 57$) and noncued

($N = 57$) Ss. Ss cued to forget prior items were less likely to use those items as response intrusions than were Ss who were not cued to forget the same items. In a postlist recognition task, cued and noncued Ss recognized the to-be-forgotten items with equal facility.—*Journal abstract.*

3477. Fisher, Dennis F. **Short-term memory: An annotated bibliography: Supplement I.** Aberdeen Proving Ground, Md.: U.S. Army Human Engineering Lab., 1969. iii, 62 p.—Presents an annotated compilation of 165 references dealing with short-term memory from 1968-1969. An alphabetical index of pertinent parameters of investigation and topics of interest are provided.—*Journal abstract.*

3478. Hudson, Robert L. & Austin, James B. (Mississippi State U.) **Effect of context and category name on the recall of categorized word lists.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 43-47.—Tested the hypothesis that if the context words result in the retrieval of more higher order memory units than a no-context control, then the recall of the context group will exceed that of the no-context control. Exp. I with 57 undergraduates used 3 words from each of 10 taxonomic categories as stimuli for 5 presentation-recall trials. In addition to the context group and the control group, a 3rd group was included which was presented the category names rather than the context words. Results indicate both the context group and category group retrieved more higher order units and they both exceeded the control group in number of words recalled, but did not differ from each other. Exp. II with 48 Ss was identical to Exp. I except categories were formed from the B. J. Underwood and J. Richardson norms and 6 trials were run. The category group exceeded the context and control groups in number of words recalled and there was no difference between the latter 2 groups. An explanation is offered as to why the context group failed to exceed the control group in Exp. II and both experiments are discussed regarding their support of a dependent storage model.—*Journal abstract.*

3479. Kincaid, J. Peter & Wickens, Delos D. (Ohio State U.) **Temporal gradient of release from proactive inhibition.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 313-316.—In a Peterson-type short-term memory experiment, proactive inhibition (PI) builds up rapidly but will be reduced if a shift to a new type of material is introduced. An experiment is described which tests whether PI reduction can occur as a function of the amount of time during which rehearsal is controlled, after the buildup of PI. The experiment used consonant trigrams and obtained retention measures after 10 sec. from 150 undergraduates. Each trigram contained a letter from each of 3 acoustic groups (BCPT, FXS, MN). Considerable reduction of PI was found after 45 sec. of the rehearsal controlling activity with a slight additional improvement demonstrated after 120 sec. Acoustic confusion matrices show that the acoustic properties of the letters were completely decayed after the 10-sec retention interval. It is concluded that: (a) interfering properties of verbal material can decay in time, and (b) acoustic encoding was not a significant factor in this situation. (15 ref.)—*Journal abstract.*

3480. Klein, Gary A. **Temporal changes in acoustic and semantic confusion effects.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 236-240.—Examined the effect of varying the retention interval in a recognition task on the features used by 192

undergraduates to remember the stimuli. 4 groups of Ss were tested using retention intervals of 6, 20, and 80 sec., or 20 min.. The recognition test contained words that correctly matched original list (OL) words, and 3 types of nonmatching words: neutral, acoustically similar to OL words, and semantically similar to OL words. The latency of correct responses increased over retention intervals, and was significantly longer for the acoustically and semantically similar words than for the neutral words, with no Items \times Intervals interaction. Confidence ratings and error data show constant confusion effects, suggesting that memory stages should not be defined by mode of stimulus representation.—*Journal abstract.*

3482. Murdock, Bennet B. & Okada, Ronald. (U. Toronto, Ontario, Canada) **Interresponse times in single-trial free recall.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 263-267.—Investigated interresponse times in single-trial free recall. Each of 72 undergraduates was given 20 test lists with 20-word lists visually presented at either 60 or 120 words/min. Spoken recall was tape-recorded for off-line analysis. Rate of recall was inversely related to the number of words actually recalled and interresponse times were inversely related to the number of words yet to recall. Evidence suggests that these data could be consonant with a random-sampling model for single-trial free recall.—*Journal abstract.*

3483. Potts, George R. & Shiffrin, Richard M. (Indiana U.) **Repetitions, blank trials, and the vonRestorff effect in free recall memory.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 128-130.—Presented lists of 25 random words visually 1 word at a time to 160 undergraduates; they were immediately free recalled. 2 of the lists were control lists; the others were divided into experimental conditions as follows. 1 word in the central serial positions was given special treatment during presentation; this word either was given an immediate (massed) repetition, was given a spaced repetition, was displayed with an asterisk to its left, or was followed by a blank presentation period. A spaced repetition was recalled slightly better than either a massed repetition or a word with an asterisk displayed to its left, and these latter 2 were recalled at a level about double that for a nonaccentuated, nonrepeated word. A blank trial did not improve recall for the word preceding that period. Results are explicable in terms of the vonRestorff effect, and warn against drawing conclusions about repetition effects if the item repeated is unique enough to induce the vonRestorff phenomenon.—*Journal abstract.*

3484. Rich, Robert. (Monash U., Clayton, Victoria, Australia) **"Acoustic confusions" in short-term memory and auditory imaging.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 185-192.—Short-term memory confusions tend to resemble errors made in auditory signal identification tasks. 2 kinds of explanation have been advanced to account for this. 1 postulates an acoustic, the other an articulatory mechanism. Both are compatible with available data. A test of a version of the acoustic hypothesis is reported. Auditory imaging was postulated as the mechanism involved. 6 undergraduates with poor auditory imagery, and a control group, were used in 2 experiments: a visual

short-term memory task, and an auditory signal identification task. The confusion matrices from the 2 experiments were rank correlated. Rhos were significant for both kinds of S, implying that auditory imaging is not involved in short-term memory. (27 ref.)—*Journal abstract.*

3485. Saltz, Eli & Modigliani, Vito. (Wayne State U., Center for the Study of Cognitive Processes) **Meaningfulness and short-term memory: Test of a model.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 309-312.—Theorizes that, under certain specifiable conditions, words with high frequency in the language will be recalled better than words of low frequency, while in other conditions the reverse will occur. 52 undergraduates were tested in short-term memory in a 2×5 factorial design. Recall of 2 words visually presented for 1 sec. was tested following a series of random numbers verbally presented by E and recorded by Ss. Results support the predictions.—P. Zell.

3486. Shulman, Harvey G. & Martin, Edwin. (Ohio State U., Human Performance Center) **Effects of response-set similarity on unlearning and spontaneous recovery.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 230-235.—Studied the effects of conceptual similarity between response sets in paired-associate retention with 144 female undergraduates. List 1 retention was measured at 3 retention intervals following List 2 learning. The relationship between the 2 lists was either the A-B, A-D or A-B, C-D paradigm, with 2 levels of response-class similarity studied within each paradigm. Results show significant evidence for both unlearning and spontaneous recovery. The amount of unlearning observed increased with response-set similarity and stimulus similarity (A-D vs. C-D paradigm). The response-set suppression hypothesis, in conjunction with the role of stimulus factors in retroactive interference, explains the data. (16 ref.)—*Journal abstract.*

3487. Thomson, Donald M. & Tulving, Endel. (U. Toronto, Ontario, Canada) **Associative encoding and retrieval: Weak and strong cues.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 255-262.—Reports data from 3 experiments in support of the encoding specificity hypothesis of retrieval: the effectiveness of retrieval cues depends upon the specific format of encoding of the to-be-remembered (TBR) words at the time of their storage, regardless of how strongly the cues are associated with the TBR words in other situations. In the critical experimental conditions, TBR words were studied in presence of weakly associated cue words. 180 female undergraduates served as Ss. Recall of the TBR words in the presence of these cues was greatly facilitated in comparison with noncue recall; recall of the TBR words in presence of their strongest normative associates, which had not been seen at input, did not differ from noncue recall.—*Journal abstract.*

3488. Turvey, M. T., Brick, P., & Osborn, J. (U. Connecticut) **Temporal course of proactive interference in short-term memory.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 467-472.—In 3 experiments with 200, 150, and 120 undergraduates, respectively, each S in each condition received 5 successive short-term memory (STM) tests with phonemically similar consonant trigrams as the items to be remembered. The retention interval for Tests 1-4 of all conditions was held constant at 16.5 sec. On Test 5 the

retention interval was varied across conditions with the 3 experiments exploring retention intervals in the range 1-21.5 sec. In all experiments little, if any, forgetting was observed on Test 1, and proactive interference (PI) was observed to develop across tests. Analysis of the Test 5 data indicate that the PI effect of prior test items upon the Test 5 target item reached a maximum by 6.5 sec., with no further forgetting beyond this interval. Test 5 data also suggest a reminiscence effect at the longest retention interval of 21.5 sec. Implications of data for a theory of PI in STM are discussed.—*Journal abstract.*

THINKING

3489. Bose, U. (Indian Statistical Inst., Calcutta) **An investigation into the relationship between speed of work and intelligence.** *Psychology Annual*, 1969, Vol. 3, 20-26.—High scoring individuals in a matching test also scored high on tests of verbal reasoning, mental alertness, and following directions. Correlation coefficients, though low, were all significant at the .01 level.—*U. Pareek.*

3490. Greene, Judith M. & Wason, P. C. (Birkbeck Coll., U. London, England) **Negation: A rejoinder to Wales and Grieve.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 238-239.—R. J. Wales and R. Grieve (see PA, Vol. 44:4543) report an experiment in which they show that a factor of confusability affects the comprehension of affirmative and negative sentences, and then claim that this is a relevant factor in explaining the difficulty of negatives. Arguments and experimental evidence to dispute this claim are presented.—*Journal abstract.*

3491. Luchins, Abraham & Luchins, Edith H. (State U. New York, Albany) **Wertheimer's seminars revisited: Problem solving and thinking: II.** Albany, N.Y.: State U. New York, Faculty-Student Assn., 1970.—This is the 2nd of 3 volumes reconstructing Wertheimer's seminars. Topics covered include: structural vs. functional solutions in arithmetic, teaching arithmetic, number concepts, Piaget vs. Wertheimer, sum of a series, seeing structure in numerical sequences, understanding items in terms of structure, understanding some mathematical structures, differences between perception and thinking, diagnostic testing for understanding of structure, symmetry, stability and rho-connections, Pragnanz and closure, focusing on the details vs. facing the structure, imagining figures, lines and curves, definition of structure, and structures and connections. Each chapter contains suggestions for future research as well as reports of unpublished investigations begun under Wertheimer's supervision and outgrowths of this work. Each chapter is built around verbatim remarks by Wertheimer. The discussion reflects the intellectual climate in psychology in the 1930s and is related to present-day discussions of learning, thinking, and teaching as well as fundamental assumptions of theoretical psychology.—*Author abstract.*

3492. Wason, P. C. & Johnson-Laird, P. N. (University Coll., Psycholinguistics Research Unit, London, England) **A conflict between selecting and evaluating information in an inferential task.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 509-515.—Investigated an inferential task in which 36 undergraduates selected which of 4 cards they needed to inspect in order to determine whether a rule was true or false. In 1 condition crucial information was concealed on the other

side of the cards, and in another condition it was on the same side of the cards, but covered by a mask. A previous experiment suggested that Ss sometimes confused the notion of the other side of the card. But no difference was found between these 2 conditions. Only 2 Ss initially made the correct selection. An attempt was made subsequently to enable Ss to correct their errors by asking them to evaluate the cards in relation to the rule. When a conflict occurred between the selection of the cards and their evaluation, some insight was gained. In other cases these 2 processes passed one another by, in spite of the fact that this involved self-contradiction.—*Journal abstract.*

3493. Williams, Robert F. & Underwood, Benton J. (Northwestern U.) **Encoding variability: Tests of the Martin hypothesis.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 317-324.—In Exp. I, with 270 undergraduates, an A-Br transfer paradigm was used with low-meaningfulness (M) trigrams as stimuli and numbers as response terms. To control stimulus selection, a single letter (1st or 3rd) was printed in red, or no letter was in red (control). This variable was orthogonal across the 2 lists. To determine if the red-letter manipulation influenced stimulus selection, backward recall of the trigrams was taken. Results show that stimulus selection was controlled but that transfer was uninfluenced by change in the functional stimulus for the 2 lists. In Exp. II, items from widely different M levels were presented for varying frequencies, after which 30 Ss made absolute frequency judgments. Meaningfulness did not influence these judgments, but recall and M were related. Results are interpreted to mean that variability in encoding of low-M stimuli is not of the magnitude assumed by E. Martin's (see PA, Vol. 43:294) theory of encoding variability.—*Journal abstract.*

Problem Solving

Concepts

3494. Arenberg, David. (National Inst. of Health, Gerontology Research Center, Baltimore, Md.) **Equivalence of information in concept identification.** *Psychological Bulletin*, 1970(Nov), Vol. 74(5), 355-361.—Describes a method which provides equivalent amounts of information for logically equivalent selections in concept identification when Ss select instances. Equivalence is maintained between comparable conjunctive and disjunctive problems as well as within a particular problem type. This equivalence-of-information method permits amount of information gained to be used to measure performance for each selection. The nonequivalence of available information which usually results when solutions are fixed and when Ss select instances is avoided by this method. Data from an experiment in which the equivalence-of-information method is used suggest that amount of initial information gain is a variable that merits investigation and indicate that pooling results of concept problems with high and low initial information may obscure important differences.—*Journal abstract.*

Dissertation Abstracts International, 1970(Jul), Vol. 31(1-B), 406-407.

3496. Bourne, Lyle E. (U. Colorado, Inst. for the Study of Intellectual Behavior) **Knowing and using concepts.** *Psychological Review*, 1970(Nov), Vol. 77(6), 546-556.—In 2 experiments, 78 and 48 undergraduates, respectively, solved several problems in which the object was to find the correct conceptual rule (out of 4 rules—conjunctive, disjunctive, conditional, or biconditional) for sorting of geometrical designs. Sizable general positive intra- and interrater transfer effects were observed. The effects were traceable to the acquisition by Ss of a simple yet general problem-solving strategy based on the bidimensional logical truth table, and suggest a tentative hierarchical model of the sophisticated S's knowledge and skill (cognition and competence) based on the embeddedness and generative character of concepts.—*Journal abstract.*

3497. Deffenbacher, Kenneth A. (U. Nebraska, Omaha) **An extension of four single-cue process models to conjunctive concept learning.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 95-102.—Extended a family of 4 different process models of single-cue concept learning to 2-category conjunctive concept learning. The fit of these 4 extended models to data from 120 undergraduates solving conjunctive problems over a wide range of stimulus complexity was assessed. None of the models fit the data over all levels of stimulus complexity. Possible reasons for this lack of fit are discussed.—*Journal abstract.*

3498. Gardner, P. L. (Monash U., Clayton, Victoria, Australia) **Relative difficulty of restricted-conjunctive and conjunctive concepts.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 211-213.—Defined a restricted-conjunctive concept as the joint presence of a number of relevant attribute values and the absence of another attribute value. 32 high school students were randomly allocated to 1 of 2 treatment groups. Stimuli presented to Group R defined a restricted-conjunctive concept; Group C attempted a conjunctive concept. Group R made a significantly greater total number of errors (incorrect verbalizations of the conceptual rule); successful Ss in Group R required a significantly greater time to attain the concept.—*Journal abstract.*

3499. Giambra, Leonard M. (Miami U.) **Conditional and biconditional rule difficulty with attribute identification, rule learning, and complete learning task.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 250-254.—Traced inversions in the relative difficulty of the conditional (Cond) and biconditional (Bic) concept rules to a specific task difference. Conditional rules were found to be more difficult with the attribute identification (AI) task and less difficult with the rule learning (RL) and complete learning (CL) tasks. A $2 \times 3 \times 5$ factorial design was replicated 4 times with 60 undergraduates/replication. Variables were concept rule (Cond, Bic), task (AI, RL, CL), and successive problems (5/S). Major results show (a) Cond less difficult than Bic in CL as expected and in AI which was unexpected, and (b) Cond more difficult than Bic in RL, also unexpected. The unexpected results are discussed in terms of the percentage of exemplars and the nature of the criterion used.—*Journal abstract.*

DECISION & CHOICE BEHAVIOR

3501. Appelbaum, Mark I. **A methodological study of preference.** Champaign, Ill.: U. Illinois, Urbana-Champaign, 1969. 143 p.—Traditionally, measurement of human preferential choice behavior was predicated on 2 assumptions: (a) lack of individual differences in preferential choice, and (b) use of a linear (unidimensional) model of preferential choice. The appropriateness of these assumptions and their effect on results of data analyses based on them were experimentally evaluated. 104 male undergraduates indicated their preference for stimuli in 3 choice experiments involving (a) simple geometric stimuli (color-form rectangles), (b) complex geometric stimuli (heterosexual somatic preference), and (c) abstract stimuli (preference for famous people). Data were analyzed under traditional assumptions and less restrictive sets which allowed for individual differences in preference or for a multidimensional model of preferential choice or both. It was found that profound differences among individuals exist with respect to their preferential choices and that multidimensional models of preferential choice do no worse, and usually better, than the corresponding unidimensional models. It was also shown that already existing techniques (i.e., the Tucker cluster analysis procedure and nonmetric multidimensional scaling techniques) can be employed to analyze choice behavior data with little modification. (72 ref.)—*Book abstract.*

3502. Hartley, Raymond E. & Williams, Carl D. (Memphis State U.) **A three-element model for binary prediction.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 327-335.—600 undergraduates received 1 of 4 100-trial, 2-alternative, 50%-event sequences. A model incorporating logical, experiential, and error components provided a better description of choice behavior on these 4 event schedules than an alternative model. Data suggest that each element of the model plays an important role in choice behavior.—*Journal abstract.*

3503. Howard, Nigel. (U. Waterloo, Ontario, Canada) **Note on the Harris-Rapoport controversy.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 316.—Argues that a valid interpretation of metagame theory applied to the 1-shot game requires remembering that it is both an equilibrium and a predictive theory and that R. J. Harris (see PA, Vol. 44:231) and A. Rapoport (see PA, Vol. 45:Issue 3) have missed the point. It is concluded that the "theory of human conflict and cooperation" is only empirical rather than logically necessary or normative.—G. Steele.

3508. Cohen, Leon. (Stanford U., Medical School) **Interaction between limbs during bimanual voluntary activity.** *Brain*, 1970, Vol. 93(2), 259-272.—While performing a series of alternate flexions and extensions of 1 wrist, Ss were required to perform 1 rapid flexion-extension of the other wrist in response to click signals. Analysis of EMG showed that in most cases there was a brief halt in alternating movement due to interruption of activation of muscles; it was not due to extraneous muscle activity nor to an effect on transmission of motor commands. Passive movement of 1 limb generally had no effect upon alternating movement of the other. It is suggested that bimanual interference is produced by a regulatory mechanism which acts to reduce the competition of afferents from the 2 limbs for a central signal processing mechanism.—W. A. Wilson.

3509. Eckstein, Gustav. **The body has a head.** New York, N.Y.: Harper & Row, 1970. xix, 799 p. \$12.50.—Presents a description of the functions of the human body culminating in the relation of the mind to the body. To provide historical perspective, the ideas of leading historical figures are initially summarized. This is followed by a contemporary treatment of various systems of the body as viewed by a physiologist.

3510. Genkin, A. A. **Razbienie na klassy psikhofiziologicheskikh svoistv, osnovannykh na vzaimosvyazi povedencheskikh, elektrokorkovykh i elektrokozhnykh indikatorov.** [Classification of psychophysiological characteristics, based on interrelationships of behavioral, electrocortical and electrocutaneous indices.] *Doklady Akademii Nauk SSSR*, 1970, Vol. 192(6), 1363-1366.—9 physiological and psychological measures were taken on 18 adult Ss and correlated. The only significant correlations were those between the rate of information transmission in the visual-motor system and the average level of asymmetry of the duration of phases of parieto-occipital EEG during a 60-sec interval (.65) and between average GSR and the average EEG cycle during a 60-sec interval (.68). The nonsignificant correlations were due to groups of Ss whose data differed in opposite directions. Thus, the interaction of differences in RT to auditory signals of different intensities (RT), EEG asymmetry, and shift in GSR under instructions was found to be due to the existence of Ss with "weak" and "strong" excitatory processes. In Ss showing positive correlation between number of errors in a cancellation task and RT also showed a slower EEG, a higher level of EEG asymmetry, and a higher level of GSR in comparison with their complementary counterparts. Results are discussed in terms of the temperamental types of Teplov and Nebylitsin.—L. Zusne.

3511. Gross, Charles G. & Zeigler, H. Philip. (Eds.) (Harvard U.) **Readings in physiological psychology: Learning and memory.** New York, N.Y.: Harper & Row, 1969. x, 313 p.—Presents readings by various authors in 4 areas of learning and memory: (a)

consolidation theory and retrograde amnesia, (b) nature of structural change in learning, (c) functional localization, and (d) electrophysiological approaches.

3512. Milner, Peter M. (McGill U., Montreal, Quebec, Canada) **Physiological psychology.** New York, N.Y.: Holt, Rinehart, & Winston, 1970. x, 531 p.

3513. Pribram, K. H. (Ed.) (Stanford U.) **Brain and behaviour: I. Mood, states, and mind: Selected readings.** Baltimore, Md.: Penguin Books, 1969. 496 p. \$2.95(paper).—Presents the 1st of a 4-volume collection of papers concerned with the interrelationship of the brain and psychological processes. Selections by various authors range from early previously untranslated papers to recent contributions by leading neuropsychologists, and cover the following areas: (a) sleep, alertness, and mood; (b) physiological drive states; and (c) attention and the control of input.

3514. Pribram, K. H. (Ed.) (Stanford U.) **Brain and behaviour: IV. Adaptation: Selected readings.** Baltimore, Md.: Penguin Books, 1969. 524 p. \$2.95(paper).—4th in a 4-volume series of papers by various authors on the brain-behavior relationship. Topical areas covered include language and thought, motivation, and emotion. An overview section of 5 papers for the entire series is included.

3515. Rosenberg, Kenneth M., Denenberg, Victor H., & Zarrow, M. X. (State University Coll. New York, Oswego) **Mice (*Mus musculus*) reared with rat aunts: The role of rat-mouse contact in mediating behavioural and physiological changes in the mouse.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 138-143.—Mice were fostered by rat aunts that had their nipples removed (thelectomy). "As hypothesized, the experimental effect was greater than previously obtained using other aunt preparations and approximated the effect obtained using rat mothers." The mortality rate in aunt-reared animals was higher than in controls. In Exp. II, the effect of the presence of thelectomized rats (with or without parturitional experiences) on mice reared by their natural mothers was observed. Postpartum rat aunts were more maternal than control aunts. Rearing with postpartum aunts reduced activity and the adrenal corticosterone response in mice.—G. Greenberg.

3516. Rozenblat, V. V. **Sovremennye problemy dinamicheskoi biotelemetrii.** [Current problems in dynamic biotelemetry.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 123-138.—Examines problems concerning the future development of dynamic radiotelemetry in physiology and medicine which are basically concerned with (a) enhancement of the operational capacities of instrumentation, (b) extension of the range of recorded parameters, (c) development of multichannel systems, and (d) automatic treatment and analysis of information.—J. D. London.

3518. Teumer, E. **Philosophische Probleme der Wechselbeziehung von Struktur und Funktion in der Biologie.** [Philosophical problems of the mutual relationship between structure and function in biology.] Jena, Germany: VEB Gustav Fischer, 1969. 130 p.—Views the concept of structure as a philosophical concept of the same order as the concepts of space, time, and movement. Function is viewed as expressive of a "definite form of movement, connected with the more

highly organized systems bearing within themselves the capacity of regulation." The interaction of structure and function is seen as a "unity of contradictory aspects."—*I. D. London.*

3519. **Timo-laria, Cesar, et al.** (U. São Paulo, Medical School, Brazil) **Phases and states of sleep in the rat.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1057-1062.—Studied the sleep of 60 Wistar albino rats with chronically implanted electrodes to record the electrocorticogram (ECoG), the cervical EMG, and eye movements. ECoG changes in areas 10, 4, 6, 1, 2, 2a, 3, and 7 paralleled the patterns found in the human EEG during the various stages of sleep, whereas in areas 23, 24, 29b, and 29c the waves were in synchronism with the dorsal hippocampus, thus allowing to follow the limbic electrical activity during sleep. The desynchronization of arousal was found distinct from the pattern recorded during the paradoxical phase. It is suggested that what is termed slow-wave or synchronized sleep, and paradoxical phase or desynchronized sleep be considered, respectively, synchronized and desynchronized states of sleep, each one comprising more than 1 phase or stage. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 266-272.—Presents details of the functional design and basic circuits employed in an electronic differentiator capable of producing 1st and 2nd derivatives.—*I. D. London.*

3521. **Wieland, Betty A. & Mefferd, Roy B.** (Veterans Administration Hosp., Psychiatric & Psychosomatic Research Lab., Houston, Tex.) **Systematic changes in levels of physiological activity during a four-month period.** *Psychophysiology*, 1970(May), Vol. 6(6), 669-689.—Examined intraindividual differences over a 4-mo period in a number of physiological variables for 3 Ss. Autocorrelation techniques revealed the presence of systematic changes (cycles and trends). It is concluded that intraindividual differences in these variables are as large as interindividual differences and that they cannot be explained as errors of measurement. Possible sources of variability are discussed. (29 ref.)—*Journal abstract.*

NEUROLOGY

3522. ———. **Andreï Ivanovich Naumenko.** *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1303.—Recounts the life and work of A. I. Naumenko on the occasion of his 60th birthday. He is noted for his research on cerebrospinal circulation.—*I. D. London.*

3523. **Airapet'yants, E. Sh. & Batuev, A. S.** **Printsipy konvergentnogo analizatornykh sistem.** [Principles of convergence of the analyzer systems.] Leningrad, USSR: Nauka, 1969.—A monograph, discussing (a) important problems reflecting the "present stage of development of our conceptions concerning the general laws and principles of the morphofunctional organization and integrative activity of the brain"; (b) an organic generalization of the major data of the literature and of the research materials amassed by the laboratories, directed by E. Sh. Airapet'yants, on these problems; and (c) the creation, on this basis, of an "original conception" concerning the fundamental principles of convergence for the cerebral analyzer systems, representing thereby a "creative development of the ideas of Academician A. A.

Ukhtomskii on the significance of the convergence principle in the activity of the CNS."—*I. D. London.*

3524. **Albert, D. J., Stortlien, L. H., Wood, D. J., & Ehman, Gerard K.** (U. British Columbia, Vancouver, Canada) **Further evidence for a complex system controlling feeding behavior.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1075-1082.—Explored the distribution of brain regions involved in feeding behavior by disturbing synaptic conduction and interrupting neural pathways. Food consumption of hungry male hooded rats was significantly reduced by blocking synaptic conduction (with procaine hydrochloride) in the lateral hypothalamus, anterolateral hypothalamus, and globus pallidus but not by similar disturbances in the amygdala, preoptic area, posterolateral hypothalamus, or caudate nucleus. In Exp. II with female Ss, severe aphagia and adipisia followed cuts in the coronal plane anterior and posterior to the lateral hypothalamus. Less severe effects occurred with cuts in the sagittal plane lateral to the hypothalamus or coronal cuts through the posterior internal capsule. There was only a transient effect with cuts through the preoptic area. Results suggest a feeding circuit which passes from the brainstem longitudinally through the lateral hypothalamus from where separate bundles pass to the anterolateral hypothalamus, globus pallidus, and thalamus. (35 ref.)—*Journal abstract.*

3525. **Badalyana, L. O. (Ed.)** **Rukovodstvo po metodike issledovaniya nervnoi sistemy.** [Manual on methods for examining the nervous system.] Moscow, USSR: Meditsina, 1968. 296 p.—Presents a manual involving (a) the bases of general neurology, and (b) the procedures for examination of the nervous system and its functions, including the higher cortical functions which require psychological testing.—*I. D. London.*

3526. **Bammer, H. G.** **Zukunft der Neurologie.** [The future of neurology.] Stuttgart, W. Germany: Georg Thieme, 1967. 263 p.—Presents a collection of 26 articles devoted to current directions and findings of neurological research.—*I. D. London.*

3527. **Beleslin, D. B. & Myers, R. D.** (Purdue U., Lab. of Neuropsychology) **A technique for repeated superfusion or withdrawal of fluid from the exposed cerebral cortex of a conscious animal.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1173-1175.—Describes a method for collecting substances released from the dorsal or lateral aspects of the chronically exposed cerebral cortex for use with unanesthetized animals, i.e., monkey or cat. A stainless steel reservoir was designed to (a) permit superfusion or withdrawal of fluid from the same site, (b) protect against exogenous infection, (c) reduce the possibility of leakage, and, (d) enable S to be used for repeated experiments and thus serve as its own control during behavioral and physiological changes. The exposed surface of the cerebral cortex can be superfused within the reservoir for a given interval by means of an infusion-withdrawal pump. Alternatively, fluid already present in the reservoir and in contact with the exposed cerebral cortex can be withdrawn by a syringe. Chemical or biological assays are carried out to identify the neurohumoral substances present in the superfusate or collected fluid.—*Journal abstract.*

3528. **Berkley, K. J. & Smith, O. A.** (U. Washington, Medical School, Regional Primate Research Center) **Behavioral indices for neural systems involved in pain and fear responses of monkeys.** *Experimental Neurology*, 1970(Mar), Vol. 26(3), 527-542.—Trained 7

pigtail monkeys to choose between an escape and an avoidance response by pressing 1 of 2 levers. An escape response terminated electric shock across 1 foot and indexed pain. An avoidance response terminated light or buzzer cues and indexed fear. Electrodes were then aseptically implanted in the mesencephalic-diencephalic junction of each barbiturate-anesthetized S while gross potentials evoked by electrical stimulation of the extremities were recorded at each site. Lever pressing and motor responses to electrical stimulation at each brain site (ESB) were monitored. The ESB of the lateral spinothalamic tract (LST) and the terminal nuclei of the medial lemniscus (ML) and LST systems produced much lever pressing, whereas ESB elsewhere did not. The type and location of the electric shock used during training contributed to the patterns of these lever press responses. Evoked potentials did not correlate with lever press responses to ESB, but did correlate with motor ("orienting") responses to ESB. Data indicate that: (a) the use of several physiological techniques in an S trained to make more than 1 type of response is a useful approach to the study of sensory function in the nervous system, (b) interaction of information coded by ML and LST fibers relative to pain sensation is different in each of the terminal nuclei, and (c) there may be functional differences between ventralis posteroinferior and ventralis posterolateralis. (34 ref.)—*Journal abstract.*

3529. Bundzen, P. V. & Menitskii, D. N. *Metod issledovaniya mekhanizmov samoregulatsii golovnogo mozga.* [A method of investigating the mechanisms of cerebral autoregulation.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 233-240.—Utilized automatic frequency analysis of the EEG. In the capacity of a functional test, stimulation based on the principle of feedback was employed. Contrary to the ordinary use of trigger photostimulation, a narrow-range filter was applied in the feedback chain which combined with a delay-block enabled stimulation from the average level of activity in the alpha-rhythm diapason. Utilization of different modifications of the given method (the application of continuous and rhythmic, gradual and trigger stimulation) made it possible to (a) model the homeostatic processes involving the brain and the external environment, and (b) evaluate and regulate the functional state of the CNS. The method was successfully utilized in a psychoneurological clinic for the diagnosis of several pathological states.—*I. D. London.*

3530. Chernigovskii, V. N. (Pavlov Inst. of Physiology, Leningrad, USSR) *K kharakteristike sovremennogo etapa v razvitiu kontseptsii o kortiko-vistseral'nykh vzaimootnosheniyakh.* [On the characteristics of the current stage in the development of the conception concerning cortico-visceral interrelationships.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 904-911.—Reexamines K. M. Bykov's theory of cortico-visceral interrelationships considering contemporary findings and orientations. While Bykov's view concerning the controlling action of the cerebral cortex over the internal organs is not shared, support is given to the "enormous physiological and biological significance of Bykov's conception." An attempt is made to show that, considering the current level of knowledge concerning the principles of control and automatic regulation, the "enormous factual material, accumulated by Bykov's school," should be put into correspondence with these principles. "Without this, there can be no further

progressive development of [Bykov's] conception and understanding of facts already established"; nor can there be a successful "search of new facts to confirm the viability of Bykov's conception." (English summary)—*I. D. London.*

3533. Hamburg, Max, et al. (City Coll., City U. New York) *The effect of parabiosis on audiogenic convulsions in seizure-susceptible mice.* *Experimental Neurology*, 1970(Feb), Vol. 26(2), 283-290.—4-mo-old Swiss mice, genetically predisposed to audiogenic seizures, were joined parabiotically along their flanks to mice resistant to such seizures. Controls consisted of parabiotic pairs of seizure-prone mice. 2-3 wk. after operations pairs were retested for seizure response to audiogenic stimulation. In surviving parabiotic pairs of seizure-susceptible Ss joined to resistant Ss, less than 25% of the susceptible members of the pair continued to respond to sound with convulsions when tested at 2 wk.; tests with trypan blue indicated failure or only minimal establishment of a joint circulation in those few pairs. Parabiotic pairs of seizure-susceptible Ss continued to respond with convulsions to sound when tested at 2 wk. as did 80% of unoperated seizure-prone Ss that had given a positive seizure response at the beginning of the experiment. In a few seizure-prone Ss that were separated after prolonged parabiosis with resistant controls, convulsions in response to noise reappeared again in Ss of the seizure-prone genotype 1 wk. after removal from the normal twin. It is concluded that mice predisposed to audiogenic convulsions may lack either a humoral factor or a detoxifying enzyme present in normal seizure-resistant mice. (38 ref.)—*Journal abstract.*

3534. Harris, J. Donald & Sergeant, Russell L. *Some comparisons between visual and auditory neurophysiology.* *U.S. Naval Submarine Medical Center Report*, 1969(Sep), No. 592, 8 p.—Discusses (a) the similar ranges of sensitivity to quanta of energy and the biological mechanisms whereby the physical stimuli are transformed logarithmically, (b) coding of the physical stimulus by single cells in the optic and the auditory nerves, (c) principles of neural integration in the brainstem and midbrain nuclei, (d) the point-to-point relationship between cortical activity and certain aspects of the physical stimulus, (e) the eye and ear as channels of information, and (f) cross-modality facilitation and inhibition. 3535. Ifinskii, O. B. (Pavlov Inst. of Physiology, Leningrad, USSR) *Otveti odnochnykh mekhanoretseptorov na vkluchenie i vyklyuchenie razdrzheniya.* [Responses of single mechanoreceptors to stimulatory turning on and off.] *Fiziologicheskii Zhurnal SSSR*, 1966(Jan), Vol. 52(1), 99-107.—A comparative study of the on and off responses (receptor and spike potentials) of the Pacinian bodies, utilizing either associated nerve fibers or single receptors isolated from the small intestinal tissue of the cat. It was found that the

Pacinian bodies may have different on and off reactions, depending on the strength and direction of the stimulating force, place of its application, initial pressure, and the elastic properties of the receptor capsule. Off responses were absent in completely decapsulated receptors. Under the influence of temperature, on and off receptor potentials underwent similar modifications. It is suggested that the off response in the Pacinian bodies is actually an on response, arising after cessation of stimulation owing to the elastic properties of the nerve-ending capsule. It is shown that the capsule is responsible also for the appearance of multiple discharges in the Pacinian bodies when the latter are stimulated by intense single application of current. Under static strain, to the degree that pressure increases, the reaction thresholds grow, the amplitude of spike potential falls, its duration increases, and a variability of spike-potential amplitude emerges. After slight compression full restoration of response reactions is possible.—*I. D. London.*

3536. Klimova-Cherkasova, V. I. (Inst. of Experimental Medicine, Leningrad, USSR) **O strukturno-funktsional'noi osnove filogeneticheskoi i ekologicheskoi obuslovennoi spetsifiki tsentral'noi vegetativnoi regulatsii.** [On the structural-functional basis of the phylogenetically and ecologically engendered specificities of central autonomic regulation.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 1003-1009.—Used narcotized frogs, tortoises, chickens, pigeons, cats, and dogs (Total N = 150). On analysis of the central mechanisms of tonic regulation of cardiac activity in the ascending vertebrate series, a structural-functional organization was disclosed which is generally similar. The tonic character of the suprabulbar influences upon the vagal centers of the medulla oblongata, and the tonic inhibitory influences from these centers upon the cardiac muscle are ancient properties of the central nervous structures. The spatiotemporal organization of the intracardiac impulse activity of the elementary units of the vagal nuclei exhibited no differences in the various stages of phylogenesis and in the various ecological groups. This finding is in agreement with the data on the absence of comparative-physiological differences in certain parameters of neuronal activity at other levels of the CNS. Quantitative differences in the descending influences on the bulbar centers characterized the Ss with respect to both phylogenetic and ecological indices. Ss with ecologically engendered vagotonia, the dependence on the functional state of the bulbar centers was considerably higher than in Ss which are "sympathicotonic." The ecologically engendered level of summated impulse activity directly observed in the efferent link of the bulbar centers was determined by the whole complex of afferentiation from the receptor fields specific to the ecological modality involved. It is concluded that, on the whole, the ecological specificity of the functioning of the bulbar autonomic centers is secured by their interaction with the higher structures. (English summary) (19 ref.)—*I. D. London.*

3537. Kogan, A. B. (State U., Rostov-on-Don, USSR) **Nekotorye ekologicheskie osobennosti neironnoi organizatsii korkovogo analiza zritel'nykh i slukhovykh signalov.** [Some ecological features of the neuronal organization of cortical analysis of visual and auditory signals.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 966-970.—Presents an experi-

mentally based discussion showing that at the level of neuronal organization of the cortical divisions of the visual and auditory analyzers, their adaptation to primarily the analysis of stimuli appears. The modality of the stimuli acquired considerably more signal significance in connection with the conditions of life. Signs of this adaptation are visible in the neuronal mechanisms considering that the polymodal neurons of the associative cortical zones in the cat—a "seeing" animal—are recruited into the excitatory reactions mainly by photic stimulation, but are mostly inhibited in response to acoustic stimulation. Reversed relationships are disclosed in the rabbit—an animal whose orientation is more "auditory." The speed of emergence of excitatory impulse responses to sound is also less in cats than in rabbits. All these manifestations of "ecological specificity" seem connected with the activity of nerve cells at a depth of not more than 1000 microns from the surface, i.e., within the limits of Layers I-III.—*I. D. London.*

3538. Kopylova, G. N., Kisel'eva, L. D., & Udel'nov, M. G. (Lomonosov State U., Moscow, USSR) **Vzaimodeistvie mezhdu vliyaniyami na serdtshe ekstrakardial'nykh i vnutriserdechnykh nervnykh putei.** [Interaction between the influences of extracardial and intracardiac nervous pathways on the heart.] *Fiziologicheskii Zhurnal SSSR*, 1966(Jan), Vol. 52(1), 79-85.—Attempted to determine the possibility and forms of interaction between the effects of joint and separate electric stimulation of the extracardial and intracardiac nervous system on the heart in frogs. It is shown that intracardiac and extracardial influences had a common final pathway in the intramural nervous system of the heart.—*I. D. London.*

3539. Kreindler, A. **Dinamica proceselor cerebrale.** [Dynamics of cerebral processes.] Bucharest, Romania: Romanian Academy of Sciences, 1967.—A monograph devoted to a "multifaceted and active discussion" of the dynamics of the cerebral processes in their "experimental and cliniconeurological aspects." This "attempt at a dialectical synthesis," dealing with key problems in neurology and neurophysiology, incorporates not only recent data derived from the world literature, but also the latest results of research, conducted at the Institute of Neurology of the Romanian Academy of Sciences.—*I. D. London.*

3540. Lauben, V. F. & Schliack, H. **Leitfaden der Neurologie.** [Textbook of neurology. (8th ed.)] Stuttgart, W. Germany: Georg Thieme, 1967. 302 p.—A manual for doctors and medical students.—*I. D. London.*

B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 197-202.—Presents the block diagram and basic circuit of a device for neurophysiological research.—*I. D. London.*

3542. Manni, Ermanno & Giretti, Maria L. (U. Sassari, Inst. of Human Physiology, Italy) **Central eye nystagmus in the pontomesencephalic preparation.** *Experimental Neurology*, 1970(Feb), Vol. 26(2), 342-353.—An acute "pontomesencephalic" preparation, surgically separated from the thalamus and from the medulla oblongata, was prepared in the guinea pig. A region was isolated from the other parts of the CNS by 2

transections, 1 rostral to the oculomotor nuclei and the other just caudal to the abducent nuclei. This preparation was also deprived of the cerebellum and of all the vestibular nuclear complex; it contained only the nuclei of cranial nerves III, IV, and VI, part of the trigeminal nuclear complex and part of the reticular formation. Electrical stimulation of the surface of 1 superior colliculus still produced contraversive quick-phase ocular nystagmus. This ponto-mesencephalic preparation represented the minimal brainstem portion indispensable for central eye nystagmus. It is concluded that the neural mechanism for central ocular nystagmus is located in the brainstem between and including the oculomotor and abducent nuclei. While the reticular formation seemed to be involved in the circuitry of central eye nystagmus, the vestibular nuclei were not essential. (35 ref.)—*Journal abstract*.

R. **Is-pol'zovanie sledyashchei sistemy dlya mikroelektronnogo poiska neuronov.** [Utilization of a tracking system for microelectrode search of neurons.] In E. B. Babskiĭ (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 192-196.—Describes a tracking system which controls the micro-manipulator for implantation of the microelectrode into the nervous tissue, and conducts both extra- and intracellular search for neurons. The basic circuit of the device utilized in the automatic search for neurons is presented.—I. D. London.

3544. Palmer, Gene C., Davenport, Rodman, & Ward, James W. (Vanderbilt U., Medical School) **Involvement of RNA synthesis in the fixation of abnormal reflexes in the newborn rat.** *Experimental Neurology*, 1970(Feb), Vol. 26(2), 263-274.—A lesion placed in the anterior cerebellum of a newborn rat produced an asymmetrical flexion of the ipsilateral hind limb. When a midthoracic transection of the spinal cord was made before a median time of 38 min. had elapsed, the postural asymmetry disappeared. When the cord was cut after 38 min., the asymmetry persisted. T. J. Chamberlain, P. Halick, and R. W. Gerard termed this critical period "fixation time" and postulated that fixation may involve metabolic changes in appropriate neurons. In the present experiments, injected actinomycin-D delayed fixation to 68 min. and decreased the uptake of labeled uridine into the spinal cord. At 30 min. following the cerebellar operation, the uptake of labeled uridine into the spinal cord was decreased in Ss with the lesion as compared with the sham-operated controls. Isolation of nuclear and cytoplasmic fractions and autoradiography revealed that the label was confined to the neuronal nuclei. At various times following the cerebellar lesion, there were no changes in total spinal cord RNA and no differences in RNA levels between left and right sides of the spinal cords in either control or experimental Ss. (21 ref.)—*Journal abstract*.

3545. Popov, A. K., Volkov, A. M., Arutyunov, S. K., & Lobusov, E. S. (Inst. of Medical & Biological Problems, Moscow, USSR) **O mekhanizmakh spontannoi ritmicheskoi aktivnosti kory mozga.** [Mechanisms of spontaneous cortical activity.] *Doklady Akademii Nauk SSSR*, 1970, Vol. 193(1), 245-247.—Hodographs of 2 points on the perimeter of a circle were used as a model to simulate neural interaction in an analog computer. The results lead to the conclusion that spontaneous activity of cortical structures is due to a mechanism which incorporates a strict sequentiality of changes in a

specific type of neural interaction.—L. Zusne.

3546. Pushkarev, Yu. P. (Pavlov Inst. of Physiology, Leningrad, USSR) **O zavisimosti vozvratnogo tormozheniya ot uslovii antidromnogo i ortodromnogo razdrazhenii.** [On recurrent inhibition as a function of the conditions of anti- and orthodromic stimulation.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1210-1218.—42 nembutalized cats were used to study the susceptibility of motoneurons to antidromic inhibition under various conditions of activation, utilizing rhythmic stimulation of motor and afferent nerves and that of spinal roots. Recurrent inhibition of segmental reflex reactions was brought about most effectively within the range of 5-35 stimuli per 1 sec. of antidromic stimulation, attaining a maximum at 35 ± 5 stimuli/sec. Recurrent influences were more marked at the limits of the monosegmental level than at those of the heterosegmental level. It is found that, along with this, the distribution of recurrent inhibition is affected more by a functional than by a spatial factor. Various degrees of recurrent inhibition were observed within the various groups of motoneurons. (English summary) (25 ref.)—I. D. London.

3547. Smith, Allan M. (McGill U., Montreal, Quebec, Canada) **The effects of rubral lesions and stimulation on conditioned forelimb flexion responses in the cat.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1121-1126.—Unilateral lesions in the region of the red nucleus impaired the ability of 5 cats to perform conditioned flexion responses in the contralateral forelimb. Conditioned flexion responses could be trained in the forelimb ipsilateral to rubral lesions. Ss with control lesions ipsilateral to the trained forelimb showed no deficit as a result of the lesion. Exp. II demonstrated that red nucleus stimulation below the threshold for movement could be used as a CS for the anticipation of shock, and stimulation with intensities great enough to evoke contralateral limb flexion could be conditioned to a tone. (28 ref.)—*Journal abstract*.

3548. Stepanov, I. I. (1st Medical Inst., Leningrad, USSR) **O znachenii razlichnykh istochnikov zapasov mediatora v terminal'nykh apparatakh noradrenergicheskogo neirona dlya sinapticheskoi peredachi impul'sov na gladkuyu myshtsu.** [On the significance of different sources of mediator supplies in the terminal structures of the noradrenergic neuron for synaptic transmission of impulses to the smooth muscle.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1219-1224.—Investigated the postganglionic link of the sympathetic motor nerve, innervating m. retractor penis, using urethanized male dogs. The state of synaptic transmission was judged by the amplitude of the contractile responses of the muscle to transmural stimulation of the sympathetic nerves by impulses of current at submaximal strength (10 impulses/sec; 1-msec impulse; 50 sec. or 60 min. stimulation duration) under normal conditions and after blockade of all sources of mediator supplies. Synaptic transmission from the sympathetic nerve to the smooth muscle was not disrupted in the course of 60 min. of stimulation (10 cps), because of the functioning of the mediator sources in the terminal structures of the noradrenergic neurons. Reabsorption of the mediator from the synaptic slots into the terminal structures played a basic role in maintenance of the level of synaptic transmission during stimulation. Mediator loss, due to insufficient reabsorption by the terminal structures, was mainly compensated

for by synthesis of the mediator in the terminal structures. The quantity of the mediator, released from the body of the nerve cell during 60-min stimulation, was slight and had minimal significance for maintenance of the constancy of level of synaptic transmission as compared with the mediator accumulated in the terminal structures through synthesis and reabsorption there. (English summary) (22 ref.)—*I. D. London.*

3549. Val'dman, A. V., Kavalev, G. V., & Tsyrlin, V. A. (1st Medical Inst., Leningrad, USSR) **Analiz funktsional'noi organizatsii "spinal'nogo vazomotomogo tsentra."** [Analysis of the functional organization of the "spinal vasomotor center."] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 1010-1019.—Curarized cats (intact, decerebrated, and spinal) served as Ss. Data provide evidence for the complex morphofunctional and neurochemical organization of the associative elements of the spinal "vasomotor center." The functional activity of the segmental vasomotor apparatus was modulated by descending influences from supraspinal structures and afferent impulsion at the segmental level. The utilization of neurotropic agents—nembutal, dehydroergotoxin, aminazine (chlorpromazine), morphine, amizyl, and scopolamine—in analysis made it possible to distinguish in the propriospinal system neuronal elements with definite functional tendencies. (English summary) (23 ref.)—*I. D. London.*

3550. Vasilevskii, N. N. & Soroko, S. I. (Inst. of Experimental Medicine, Leningrad, USSR) **Sledovye protsessy i kletochnye mekhanizmy pamyati.** [Trace processes and cellular mechanisms of memory.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 957-965.—Rabbits were used to study trace effects in neurons of the cortical projection zone of the cutaneous analyzer with particular attention directed to the mechanisms regulating the display of trace rhythms. Data demonstrate that the neurons of the cortical projection zone participate in the fixation and reproduction of sensory information. It appeared most probable that the cortical projection zones, and the deep structures of the brain form a single synaptically interconnected system, the activity of whose elements secures the fixation and subsequent exact reproduction of past states. Despite the generalized changes in summated bioelectrical activity, appearing in the form of activation or rhythms "tagged with respect to interval," the differentiated appearance of trace discharges "tagged with respect to interval" was observed in projection neurons. Discharges, "tagged with respect to interval," or their groups were reproduced only by those cells, whose local receptive fields were subjected to prolonged rhythmic stimulation. The neighboring cellular populations also underwent active inhibition. Since the receptive fields of the neurons in these populations were distributed alongside fields of cells earlier subjected to prolonged activation, it is assumed that the spatial differentiated reproduction of discharges, "tagged with respect to interval," is secured by mechanisms of accessory (afferent) inhibition. In the course of fixating the rhythm of afferent stimulation, plastic changes take place in both the system of excitatory and inhibitory synaptic unions between neurons. LESIONS

3553. Genes, S. G. & Lesnoi, N. G. (Inst. of Endocrinology & Hormonal Chemistry, Kharkov, USSR) **Evakuatornaya funktsiya zheludka v otsutstvie nadpocheknikov i pod vliyaniem izbytko glyukokortikoidov.** [Evacuatory function of the stomach in the absence of adrenals and under the influence of an excess of glucocorticoids.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1272-1277.—Ss were adrenalectomized dogs, recipients of deoxycorticosterone acetate (DOXA). Some findings: Unilateral adrenalectomy produced in the beginning a weakening of the evacuatory function of the stomach, but later, as a consequence of developing compensation in the remaining adrenal, it normalized. Bilateral adrenalectomy, compensated by DOXA, did not change the evacuatory function of the stomach in 3 Ss, but weakened it considerably in 1 S. The evacuatory function of the stomach was stable both when the glucocorticoids were absent and when they were present in excess. Glucocorticoid preparations influenced the evacuatory function of the stomach both humorally and locally, acting directly on the tissues of the gastric wall. In both cases, the central and autonomic nervous systems played a definite role.—*I. D. London.*

3554. Itina, L. V. (Inst. of Physiology, Minsk, USSR) **Tormoznye efferentnye vliyaniya bluzhdaiushchego i chrevnogo nervov na retseptory tonkogo kishchnika.** [Inhibitory efferent effects of the vagus and splanchnic nerves on the receptors of the small intestine.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1261-1271.—10 dogs were used to study the reflex responses, whose efferent arc is not connected with the vagus or splanchnic nerves, in order to further analyze the specific behavior of the receptors of the small intestine. Irrigation of the middle sections of the small intestine with solutions of glucose or NaCl in sufficient concentrations had an inhibitory influence on the alimentary CRs and salivary UCRs, and time of eating and food-procuring reactions of the animals. Subdiaphragmatic section of the splanchnic or vagus nerves or of both together and the im administration of 1 mg/kg hexonium intensified the inhibitory influences of glucose and NaCl from the intestines on the salivary reflexes—evidence for the existence of a constant inhibitory central influence on the receptor apparatus of the intestines. It is suggested that there are differences in the receptor apparatus of the intestine participating to produce the observed gastric and salivary secretory effects. (English summary)—*I. D. London.*

3555. Michael, Richard P. & Zumpe, D. (Bethlem Royal Hosp., Kent, England) **Sexual initiating be-**

haviour by female rhesus monkeys (*Macaca mulatta*) under laboratory conditions. *Behaviour*, 1970, Vol. 36(3), 168-186.—Attempted to confirm the observation that, in addition to the well-known presentation of the female rhesus monkey, the gestures of hand-reaching, head-ducks, and head-bobs have sexual significance. 7 measures of sexual activity were used to obtain data on pairs of Ss before and after ovariectomy. It was found that prior to the operation all females presented, the vast majority showed hand-reaching and head-ducks, and about 1/3 showed head-bobs. On a percentage basis, presentations were more effective in triggering successful mounting than the head and hand movements though the latter still accounted for a majority of initiated mounts. Immediately after ejaculation all these behaviors virtually ceased. Ovariectomy had the effect of decreasing the total number of invitations and increasing the number of refusals. The data provide strong evidence that hand-reaches, head-ducks, and head-bobs are female sexual invitations and that earlier studies which excluded these presented an incomplete picture of sexual behavior. (German summary) (33 ref.)—S. R. Goldstein.

3556. Saff'iants, V. I. (Pavlov Inst. of Physiology, Leningrad, USSR) **O mekhanizme diltel'nykh kontralateral'nykh vliyaniy v spinnom mozgu pri odinokhnykh razdrazheniyakh.** [On the mechanism for prolonged contralateral effects in the spinal cord when single stimulations are employed.] *Fiziologicheskii Zhurnal SSSR*, 1966(Jan), Vol. 52(1), 34-39.—Cats with upper spinal section (C₄) were Ss in a study to determine to what degree extensive prolongation of contralateral effects in the lumbosacral division of the spinal cord may be due to recruitment into reflex activity of the upper segments of the spinal cord, and proprioceptive feedback impulsion, arising in the receptor apparatus of the contralateral muscles upon their contraction. Prolonged inhibitory and exaltatory contralateral effects were maintained even when only the lumbosacral division of the spinal cord was functioning. Section of the contralateral ventral roots of the lumbosacral division of the spinal cord did not change the duration of such effects when single stimulations were applied. The data suggest that these effects are traceable to the activation of a large number of internuncial neurons.—I. D. London.

3557. Savos'kina, L. A. (Bogomolets Inst. of Physiology, Kiev, USSR) **Vliyaniye pererezki dorsal'nogo koreshka na mono- i polislin apticheskie refleksy spinnogo mozga.** [Influence of dorsal root section on mono- and polysynaptic spinal reflexes.] *Fiziologicheskii Zhurnal SSSR*, 1966(Jan), Vol. 52(1), 40-45.—Ss were cats with sectioned dorsal root (usually the 7th) under conditions of decerebration or nembutal narcosis (45 mg/kg). 12-24 hr. after dorsal root section the amplitude of both mono- and polysynaptic reflex reactions to stimulation of the sectioned root was considerably increased. 34-48 hr. afterwards a decrease occurred. 48-72 hr. later the monosynaptic reactions to stimulation of the sectioned root disappeared, while the polysynaptic reflex reactions were continued, but at a reduced level. During the same periods the amplitude of the mono- and polysynaptic reflex discharges, resulting from stimulation of an adjacent intact dorsal root, increased.—I. D. London.

Brain Lesions

3561. Bekhtereva, E. P. (Inst. of Experimental Medicine, Leningrad, USSR) **Deistvie nekotorykh farmakologicheskikh veshchestv na follikulostimuliruyushchuyu funktsiyu gipofiza v usloviyakh koagulyatsii yader mindalevidnogo kompleksa.** [Action of some pharmacological agents on the hypophyseal folliculo-stimulating function after coagulation of the nuclei of the amygdaloid complex.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 85-86.—Sexually mature male rats were used to study (a) the influence of extirpation of the amygdaloid nuclei on the level of the follicule-stimulating hormone (FSH) in the hypophysis and plasma, and (b) the features typifying the action of several hormonal and neurotropic agents on the follicle-stimulating function of the hypophysis under these conditions. Such extirpation led to an increase in the secretion of FSH by the hypophysis. Under these conditions the suppressive action on FSH production by the M-cholinolytic, metamizyl, and by estradiolmonobenzoate was increased, while the action of the N-cholinolytic, spasmolytin, either was not manifested or was similar to that of metamizyl. The data are held to support the hypothesis that the stimulation of hypophyseal FSH secretion by spasmolytin in intact Ss is accounted for by the blocking of N-cholinoreceptors, distributed in the region of the limbic structures, particularly in the amygdala.—I. D. London.

3562. Blass, Elliott M. (U. Pennsylvania, Inst. of Neurological Sciences) **Separation of cellular from extracellular controls of drinking in rats by frontal brain damage.** *Science*, 1968(Dec), Vol. 162(3861), 1501-1503.—7 female Sherman albino rats that had undergone removal of the frontal portion of the brain, including the olfactory bulbs, did not drink, or drank less than 7 controls, when subjected to cellular dehydration.

These same Ss drank normally in response to extracellular volume reduction. 10 Ss from whom only the olfactory bulbs had been removed drank normally in both tests. An essential part of the neurological system mediating drinking produced by cellular dehydration, but not by volume reduction, therefore lies within the frontal cortex or immediate subcortical tissue.—*Journal abstract.*

3563. Carlson, Neil R. & Cole, Jeffrey R. (U. Massachusetts) **Enhanced alternation performance following septal lesions in mice.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 157-161.—Male and female B6D2F, hybrid mice were given septal lesions (Group SEPT), cortical lesions (CORT), or served as unoperated controls (NORM). Ss were trained for food reward in a 2-lever single-alternation task. Performance of Group SEPT was significantly better than that of the control group; Groups CORT and NORM did not differ from each other. Results are incompatible with the hypothesis that septal lesions produce a simple deficit in response inhibition or sequential behavior. It is suggested that the results might be attributed to higher response rates because of septal lesion-induced enhancement of the reward value of the food.—*Journal abstract.*

3564. Dougherty, M., Shea, S., Liu, C. N., & Chambers, W. W. (U. Pennsylvania, Dept. of Anatomy & Inst. of Neurological Sciences) **Effects of spinal cord lesions on cutaneously elicited reflexes in the decerebrate cat. Tonic bulbospinal and spinobulbar inhibitory systems.** *Experimental Neurology*, 1970(Mar), Vol. 26(3), 551-570.—Studied regulation of polysynaptic reflexes (ipsilateral extensor, flexor, and digital) in forelimbs and hind limbs in 19 decerebrate cats. Polysynaptic reflexes (both extensor and flexor) in response to pinch were inhibited all over the body, although they were more easily obtained from certain reflexogenous zones than from others. Responses to touch, pressure, and stroke were readily elicited from the perineum but were inhibited from other areas. Tonic bulbospinal inhibitory pathways were located in the dorsal part of the lateral funiculi and facilitatory pathways in the ventral funiculi and ventral parts of the lateral funiculi. Both increased extensor tone and decreased flexor reflex activity of the forelegs after thoracic transection (Schiff-Sherrington phenomenon) were due to the interruption of ascending inhibitory fibers of spinal origin which act upon brainstem centers. The tonic spinobulbar pathways which have the effect of inhibiting brainstem centers responsible for decerebrate inhibition of polysynaptic reflexes ascend through the dorsal part of the lateral funiculi. The fibers inhibiting the brainstem inhibitory centers for extensor tone ascend in more ventral pathways. (16 ref.)—*Journal abstract.*

3565. Falkon, Daniel & Donovick, Peter J. (State U. New York, Binghamton) **Low resistance to extinction in rats with septal lesions under inappropriate appetitive motivation.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 150-156.—When a lever-pressing response trained under food deprivation was extinguished under water deprivation, 80 naive male Sprague-Dawley rats with septal lesions responded significantly less than controls. Secondary reinforcement during extinction elevated responding, except for Ss with septal lesions that had a presurgical history of water deprivation. Results are consistent with a conceptualization of the septum as an

inhibitor of a motivational state of the organism. Thus, destruction of the septum appears to enhance the response to the immediate cues guiding the behavior and thereby amplifies whatever current positive or negative motivational state is present in the organism. (22 ref.)—*Journal abstract.*

3566. Fried, P. A. (Carleton U., Ottawa, Ontario, Canada) **Pre- and post-operative approach training and conflict resolution by septal and hippocampal lesioned rats.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 975-979.—Found that pre- and postoperative approach training had differential effects on 25 male Wistar rats with septal or hippocampal lesions in an approach-avoidance conflict. Trained to run a straight alley for food reinforcement, septal lesioned Ss who received approach training after surgery showed less inhibition upon the introduction of shock than septal Ss who received preoperative approach training. Ss with hippocampal lesions however, showed a greater loss of inhibition when preoperatively trained to approach. On the trials on which the lesioned Ss did demonstrate behavioral inhibition the spatial location of approach-avoidance conflict was similar to 12 controls. Results suggest that the effect of septal lesions in an approach-avoidance situation is determined, to a considerable degree, by postoperative approach training, whereas the effects of hippocampal lesions appear to interact with preoperatively determined set. (16 ref.)—*Journal abstract.*

3567. Giantonio, Gerald W., Lund, Nick L., & Gerall, Arnold A. (U. Notre Dame) **Effect of diencephalic and rhinencephalic lesions on the male rat's sexual behavior.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 38-46.—Following extensive preoperative tests in which 234 male Sprague-Dawley rats were run to sexual exhaustion, bilateral electrolytic lesions were placed in 8 areas of the diencephalon and rhinencephalon to investigate their role in the mediation of sexual behavior. Postoperative tests indicate that lesions in the medial preoptic-anterior hypothalamic region completely abolished copulatory and ejaculatory behavior in 11 of 17 Ss while leaving precopulatory sexual arousal intact. Lesions in the stria terminalis and basomedial-corticomedial amygdala resulted in an increase in the time spent responding to ejaculation (i.e., time from initial mount with thrust, in an ejaculation series, to ejaculation) and a slight reduction in the number of ejaculations to exhaustion. (20 ref.)—*Journal abstract.*

3568. Glassman, Robert B. (Lake Forest Coll.) **Cutaneous discrimination and motor control following somatosensory cortical ablations.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1009-1019.—In an experiment with 19 adult female cats, unilateral ablation of the anterior ectosylvian gyrus (AEG) alone or in combination with ablation of the posterior sigmoid gyrus (PSG) and coronal gyrus, was followed by a contralateral cutaneous sensory deficit, as shown by tests of learned discrimination or orientation-localization of passively-received cutaneous stimuli. Performances of problems involving light touch, or a difficult discrimination, were sometimes impaired more than a simple discrimination involving pressure stimuli. Ablation of the PSG alone was not followed by a cutaneous sensory deficit but by impairment of posture and fine motor control more severe than that which followed AEG ablation. Following PSG ablation, recovery of ability to accurately

direct the forelimb with vision, but not while blindfolded, suggested a proprioceptive deficit, however, PSG ablation was also associated with damage to the corticospinal tract. Results suggest a particular division of function between Side I and Side II. (41 ref.)—*Journal abstract*.

3569. Gotsick, James E. (Syracuse U.) **The effects of stimulation and deprivation on spontaneous activity levels in rats with lesions of the septal area, cingulate cortex, and hippocampus.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 413-414.

3570. Hamilton, G. & Isaacson, Robert L. (U. Florida) **Changes in avoidance behavior following epileptogenic lesions of the mesencephalon.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1165-1167.—Created irritative lesions caused by penicillin or sodium sulfadiazine in various brain sites, particularly in the mesencephalic region, of 23 male Long-Evans hooded rats. All Ss were then tested on a 2-way active avoidance task. Lesions in the region of the interpeduncular nucleus produced severe impairments in the avoidance task while similar treatments of the reticular formation and red nucleus produced only moderate levels of impairment. Lesions at other sites failed to produce any deficits in the avoidance task.—*Journal abstract*.

3571. Jalowiec, John E., Stricker, Edward M., & Wolf, George. (McMaster U., Hamilton, Ontario, Canada) **Restoration of sodium balance in hypophysectomized rats after acute sodium deficiency.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1145-1149.—Like 8 intact male albino rats, 14 hypophysectomized (hypex) rats showed appropriate increases in thirst and sodium appetite when they became sodium deficient following subcutaneous formalin treatment. Decreased water and sodium losses in urine permitted renal retention of ingested fluids and restoration of intravascular fluid volume and sodium concentration. The only apparent effect of hypophysectomy was to decrease the rate of saline intake. Consequently, hypex Ss remained hypovolemic longer (11-20 hr.) than did intact Ss (6-10 hr.). Urinary potassium/sodium ratios suggest that aldosterone levels in hypex Ss were not increased as much as in intact Ss by the formalin treatment. Since both groups increased saline intake when mineralocorticoid levels were increased, it is possible that formalin treatment did not provide as strong a stimulus for sodium appetite in hypex as in intact Ss. Nevertheless, although pituitary hormones may potentiate sodium appetite and generally defend the animal against stress, it is concluded that the pituitary gland is not vital to sodium metabolism at either a behavioral or a physiological level. (22 ref.)—*Journal abstract*.

3572. Montgomery, Royce L. & Berkut, Michael K. (U. North Carolina, Medical School, Chapel Hill) **A morphological study of viscera in aged rats with lesions in the limbic system.** *Physiology & Behavior*(Sep), Vol. 5(9), 989-992.—35 senescent male Sprague-Dawley rats were bilaterally lesioned electrolytically in either the septal or amygdaloid area of the brain. After convalescence surviving Ss were given a short superficial behavioral test to establish the actuality of the brain lesion attempted. Further testing was not administered and Ss remained quiescent in individual cages until sacrificed. After 45 days lesioned Ss were killed and autopsied immediately along with 19 appropriate intact normal and sham-operated controls. Morphological studies of viscera revealed tubular atrophy in

testes of septally-lesioned Ss but not amygdaloid-lesioned Ss. Distinctly enlarged Bowman's spaces were seen in kidneys from Ss with septal lesions but not in kidneys of Ss with amygdaloid lesions. Adrenal hypertrophy did not develop in any of the brain lesioned (nonstressed septal and amygdaloid) Ss. Electrolytic lesions placed in septal and amygdaloid nuclei of young and senescent Ss produced analogous morphological alterations. (21 ref.)—*Journal abstract*.

3573. Perachio, Adrian A. & Lubar, Joel F. (Emory U., Yerkes Regional Primate Center) **Striate cortex ablation and deficits in conditioned avoidance response.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1063-1067.—Tested 50 adult cats for acquisition and retention of conditioned avoidance response (CAR) to an auditory CS following ablation of a portion of striate cortex. Ss were found to be significantly deficient compared with normals. Blinding normal or operated Ss with opaque contact lenses also caused a significant deficit in acquisition and retention of the CAR. Combination of striate cortex ablation and blinding by contact lenses prevented avoidance responses in 4 of 10 operated Ss. The marked deficit in an auditory task in the absence of visual cues suggests a complexity of effect of striate ablation not explainable only in terms of visual loss.—*Journal abstract*.

3574. Pronin, L. A. (Inst. of the Brain, Moscow, USSR) **O vliyanií tsentral'noi nervnoi sistemy na deyatel'nost' serdtsa u plodov krolikov.** [On the influence of the central nervous system on cardiac activity in rabbit fetuses.] *Fiziologicheskii Zhurnal SSSR*, 1966(Jan), Vol. 52(1), 73-79.—The CNS of the fetuses of 29 rabbits was subjected to various forms of surgical insult. No increase was observed in the frequency of cardiac pulsation, as was normal in the intact S in the later prenatal period, after decapitation or spinal section below the medulla oblongata. However, after ablation of the cerebral hemispheres under conditions of chronic experiment, an increase was observed. With extirpation of the medulla oblongata or the spinal cord under conditions of acute experiment, the frequency of heartbeat dropped to the level characteristic for the 28-day fetus. Until the 29th intrauterine day the frequency of heartbeat was not regulated by the CNS. By that day, brainstem structures matured which exerted their influence on cardiac activity via the spinal cord.—*I. D. London*.

3575. Roydes, Rona L. (108 E. 7th St., Oil City, Pa.) **Frontal lesions impair habituation of the head-shake response in rats.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1133-1137.—Investigated the effect of frontal lesions on habituation of the head-shake response. 2 groups of 8 male albino rats were given 2 sessions of 40 stimulated trials each, 24 hr. apart. Each session was followed by a retention test at 30 min. The stimulus was a mild puff of air directed at the pinna of the ear. A marked decrement in response frequency occurred from the 1st to the last trial block, and was highly significant, as determined by nonparametric analyses. 1 group was then lesioned in the frontal cortex, bilaterally. The other group was sham-operated. The habituation procedure was repeated after 7 days recovery from surgery. Sham-operated controls behaved as before. Frontal Ss, however, showed impaired rate of habituation and a much higher terminal level of responding, compared to controls. These results were highly significant. In addition, frontal Ss did not retain habituation at 30 min.

in contrast to controls. Controls did not recover above 50% of their initial level of responding. 4 more Ss were cingulectomized and compared with 4 controls. The cingulectomized Ss performed no differently from controls, on either major sessions or retention tests. (17 ref.)—*Journal abstract*.

3576. Schlag-Rey, M. & Lindsley, D. B. (U. California, Brain Research Inst., Los Angeles) **Effect of prefrontal lesions on trained anticipatory visual attending in cats.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1033-1041.—Trained 5 naive adult cats to look at a left and a right target on alternate trials and, while looking, to keep fixating the correct target for a criterion duration necessary to receive a visual stimulus, signaling a milk reward. 4 Ss showed a clear performance deficit in this task after bilateral removal of the anterior sigmoid and dorsal preoreus gyri. The 5th S, although temporarily impaired following a similar unilateral lesion, showed no deficit after a 2nd contralateral lesion, more laterally placed in the frontal pole. A quantitative analysis of various biases underlying overt responses showed that Ss were impaired on specific dimensions of oculomotor responses. Results agree with recent stimulation studies localizing a frontal eyefield in the cat and support the hypothesis that in carnivores and primates, the frontal eyefields control voluntary eye movements. Some performance deficits in tasks requiring use of directional cues and selective attention, observed in carnivores following frontal lobe lesion, may be due to invasion of such frontal eyefields. (23 ref.)—*Journal abstract*.

3577. Shlyifer, T. P. (Inst. of Experimental Medicine, Leningrad, USSR) **Vliyaniye pereryva vnutrikorkovykh svyazей na aktivnost' neuronov somato-sensornoi zony kory.** [Influence of interruption of intracortical connections on neuronal activity in the somatosensory cortical zone.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 971-976.—Studied the functional activity of single cortical neurons after interruption (circular section of parietal cortex) of intracortical connections (60 and 90 neurons of intact and nonintact rat brains, respectively; 35 and 65 neurons of intact and nonintact guinea pig brains, respectively). Painful (4-6 pricks in the spinal skin) and acoustic (2000-cps tone and 80-db bell) stimulation did not exert the same influence on the neurons of the somatosensory cortical zone in either group of Ss. With interruption of intracortical connections, functional lability of the cortical neurons declined, the number of active cells diminished, frequency of spontaneous impulsion decreased, and the number of cortical cells reacting to sensory stimuli dropped. In rats the auditory system exerted on the somatosensory cortical neurons a greater influence by means of intracortical paths than did the auditory system in guinea pigs. (English summary) (16 ref.)—*J. D. London*.

3578. Wakeman, Kenneth A., Donovick, Peter J., & Burright, Richard G. **Septal lesions increase bar pressing for heat in animals maintained in the cold.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1193-1195.—Allowed male Sprague-Dawley unshaven albino rats in a cold chamber to bar press for heat. Septal lesions in 12 Ss increased the number of bar presses and the relative number of reinforcements/bar press relative to levels of 14 operated controls. These differences could not be attributed to differential surgical effects on operant levels since unshaven control and septal lesioned Ss did not differ in total bar presses in the absence of reinforcement. Results are interpreted as another specific

example of the septal lesioned rat's increased reactivity to stimuli of positive hedonic value. (15 ref.)—*Journal abstract*.

3579. Żernicki, B., Doty, R. W., & Santibañez-H, G. (Nencki Inst., Warsaw, Poland) **Isolated midbrain in cats.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 221-235.—Describes electrophysiological and behavioral characteristics of isolated midbrain preparations in 8 cats. Isolation was achieved posteriorly by pretrigeminal transection, and anteriorly by premesencephalic transection or a cut paralleling the optic tract and ending in the preoptic area. These preparations displayed comparable activity. Ocular fixation reflexes were absent even in preparations having optic input, and stable CRs could not be formed. Most striking is the almost total absence of background activity in the mesencephalic reticular formation. This depression does not arise from circulatory insufficiency, shock, or cell death since: (a) pupils remain miotic, (b) electrical stimulation of the mesencephalic reticular formation yields pupillary dilation and eye movements, (c) no severe degeneration is seen in chronic preparations, (d) seizure activity is often displayed in acute and chronic conditions, and (e) background activity is not much depressed in the pretectal area and superior colliculus even with elimination of optic input. It is concluded that background activity of the mesencephalic reticular formation is dominated almost exclusively by input from the ipsilateral forebrain. (French summary) (49 ref.)—*Journal summary*.

Brain Hypothalamic & Hippocampal Lesions

3580. Antunes-Rodrigues, José; Saad, Wilson A., Gentil, Cleber G., & Covan, Miguel R. (Ribeirão Preto, Medical School, São Paulo, Brazil) **Mechanism of decreased sodium chloride intake after hypothalamic lesions: Effect of hydrochlorothiazide.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1183-1185.—In normal rats hydrochlorothiazide has a natriuretic action and in consequence S increases salt intake as a homeostatic mechanism. 57 male Wistar rats with decreased NaCl ingestion due to hypothalamic lesions failed to show this behavior in spite of the fact that their modifications in urinary and plasmatic sodium were of the same direction as those observed in 54 controls. It seems that the information about sodium concentration and therefore sodium needs is now ineffective because of the interruption of the circuit which normally receives this information. Results of this study and those published elsewhere support the hypothesis of a neural mechanism underlying the changes observed in rats with decreased NaCl intake due to bilateral anteromedial hypothalamic lesions.—*Journal abstract*.

3581. Grossman, Sebastian P. (U. Chicago) **Avoidance behavior and aggression in rats with transections of the lateral connections of the medial or lateral hypothalamus.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1103-1108.—Parasagittal surgical cuts in the medial quadrant of the lateral hypothalamus which isolated the medial half of the hypothalamus from all lateral connections produced marked deficits in avoidance learning but no discernible change in performance on a test of intraspecies aggression. 18 adult female albino Sprague-Dawley rats showed transient motor deficits as well as aphagia and adipisia but were normal on all measures before the avoidance training

and aggression tests were begun. Similar parasagittal cuts lateral to the lateral border of the anterior and medial hypothalamus (including the region lateral to the ventromedial nuclei) facilitated the acquisition of a shuttle box avoidance response but failed to affect intraspecies aggression. These Ss were aphagic and adipsic for longer periods of time but had recovered normal body weights and motor abilities at the time of testing. (30 ref.)—*Journal abstract*.

3583. Winocur, Gordon & Mills, John A. (U. Saskatchewan, Saskatoon, Canada) **Transfer between related and unrelated problems following hippocampal lesions in rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 162-169.—Groups of naive male Wistar rats with hippocampal lesions, cortical lesions, and operated controls were preoperatively trained on brightness discrimination and postoperatively tested on pattern discrimination. The operated-control and hippocampal groups displayed poorer postoperative learning as a function of preliminary training, but the amount of negative transfer was significantly greater in the hippocampal group. There was no negative transfer in the cortical group. In Exp. II. hippocampal and control groups were tested on a series of 3 independent and unrelated tasks (lever pressing, 1-way active avoidance, brightness discrimination) presented in different sequences. The combined effect of surgical treatment and prior training never interfered with performance on any of the tasks. It is suggested that hippocampal lesions interfere with the detection of important but relatively subtle changes in environmental events. (15 ref.)—*Journal abstract*.

BRAIN STIMULATION

3584. Goldstein, Robert & Templer, Donald I. (Behavior Research Lab., St. Louis, Mo.) **Comparison of learning for hypothalamic and septal stimulation.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 997-1001.—Tested the assumption of differential rates of learning for hypothalamic and septal stimulation in a T maze after having equated the reinforcement value for 2 groups in a shuttle box. Results of 2 studies with 15 and 11 female Holtzman albino rats, respectively, supported this assumption; hypothalamic Ss made a significantly greater number of choice responses in the maze when primed in the start box (Exp. II) than when not primed (Exp. I). In both experiments the hypothalamics made a significantly greater proportion of turns to the correct side. The difference in total turns was interpreted as evidence of a longer latency poststimulatory effect of hypothalamic over septal stimulation. There was also some evidence within hypothalamic Ss of a positive relationship between proportion of turns correct and the presence of stimulus-bound behavior (eating) established in a later test.—*Journal abstract*.

Chemical Stimulation

3585. Belluzzi, James D. & Grossman, Sebastian P. (U. Chicago) **Avoidance learning: Long-lasting deficits after temporal lobe seizure.** *Science*, 1969(Dec),

Vol. 166(3911), 1435-1437.—Microinjections of carbachol (carbamylcholine chloride) into the amygdaloid complex of 7 male albino Holtzman Sprague-Dawley rats produced behavioral and electrophysiological seizures which subsided within 24 hr. A persisting functional change caused a deficit in avoidance learning 1-3 wk. after the seizure. A cholinergic system is implicated by the fact that cholinergic blockade (scopolamine) of the amygdala during training reversed the effects of the seizures induced by carbachol.—*Journal abstract*.

3586. Blinkova, T. P. (Inst. of Experimental Medicine, Leningrad, USSR) **Mezhtsentral'nye vzaimootnosheniya v émbriogeneze kur.** [Intercentral interrelationships in the embryogenesis of chickens.] *Fiziologicheskii Zhurnal SSSR*, 1966(Jan), Vol. 52(1), 8-13.—Utilizing 52 chicken embryos, attempted to determine (a) the level at which the "closure function" operates during motor-electrodefensive conditioning (CS was a 100-db, 2000-cps sound) in the embryonic period (14th-16th day), (b) the role of different central structures during the course of CR activity, and (c) the interrelationships between the different parts of the brain. Data, derived from cerebral sectioning and chemical stimulation of the cerebral surface, provide evidence for the role of the cerebral hemispheres and the anterior thalamus in regulating the course of CR activity. Application of sodium salts on the hemispheric surface and the anterior thalamus excited and increased the basic functions of these structures, leading to the inhibition of CR motor reactions. It thus appears that definite inhibitory mechanisms exist in the chicken embryo. The ablation of structures, exerting an inhibitory influence, or the chemical stimulation of the middle thalamus promoted a more distinct functional manifestation of their capacity to secure the closure of CR reactions. Therefore, in the embryonic chicken conditioned motor connections are seen to undergo closure at the level of the middle thalamus.—*I. D. London*.

3587. Khavari, Khalil A. (U. Wisconsin, Milwaukee) **Chemical microinjections into brain of free-moving small laboratory animals.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1187-1189.—Described a simple cannula-swivel unit which allows chronic discrete or continuous injections into brains of moving and behaving small laboratory animals. The cannula-swivel unit, with minor modifications, may also be used for iv and intragastric injections.—*Journal abstract*.

3588. Margules, D. L. (Temple U.) **Alpha-adrenergic receptors in hypothalamus for the suppression of feeding behavior by satiety.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 1-12.—Direct bilateral application of an alpha-adrenergic blocker (phentolamine HCl) to the perifornical medial forebrain bundle of 18 male albino Charles River rats fed chow ad lib caused intense overeating of milk. This effect was anatomically localized and chemically specific. At these sites, such application of l-norepinephrine suppressed the intake of milk but d-norepinephrine did not. Adulteration of the milk with quinine sulfate (.008%) had little effect on the suppression of feeding caused by norepinephrine. Adulteration with .004% quinine eliminated the overeating caused by phentolamine and, with .010% quinine adulteration, phentolamine suppressed milk intake. Thus, blockade of α -adrenergic receptors in the perifornical medial forebrain bundle by phentolamine causes the same paradoxical effects as ventromedial hypothalamic lesions; overeating of palatable

food and finickiness for unpalatable food. α -adrenergic receptors in the hypothalamus may participate in the regulation of feeding behavior by satiety, and the negative-feedback aftereffects of these receptors may be responsible for the hunger-satiety cycle. (39 ref.)—*Journal abstract*.

3589. Margules, D. L. (Temple U.) **Beta-adrenergic receptors in the hypothalamus for learned and unlearned taste aversions.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 13-21.—Direct bilateral application of 9 μ g. of the β -adrenergic agonist, dl-isoproterenol HCl, to the perifornical medial forebrain bundle of 5 male albino Charles River rats fed chow ad lib suppressed the intake of quinine-adulterated milk, but not the intake of sweet milk. The same selective suppression of bitter milk intake was demonstrated in other Ss that had received an ip injection of .133 mg/kg of dl-isoproterenol HCl. On the day after such treatments conditioned suppression of the bitter milk-licking response occurred. Conditioned suppression of the intake of bitter saccharin was also demonstrated with posttrial ip injections of .066 mg/kg of l-isoproterenol HCl. Direct bilateral application of the highly potent and specific β -adrenergic blocker, LB-46 (16 μ g.), abolished the suppressant effects of quinine on the rate of milk licking but increased the suppressant effects of satiety on total milk intake. This constitutes the converse of the ventromedial hypothalamic paradox: a deficit in finickiness and undereating. β -adrenergic receptors in the hypothalamus may participate in the formation of unconditioned taste aversions, and the positive-feedback aftereffects of these receptors may be involved in the formation of conditioned taste aversions. (22 ref.)—*Journal abstract*.

3590. Meyer, Cornelius C. & Ruby, Theodore M. (Quinnipiac Coll.) **A stereotaxic attachment for implanting crystalline steroids in the brain.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1181-1182.—Describes a simple and efficient device for chronically implanting crystalline steroids in the brain. A disposable syringe is adapted so that a plunger extrudes a pellet into the desired brain area. The implant is easily adapted to the drill holder of a Kopf Stereotaxic Instrument. The stereotaxic technique was successfully used with domestic chicks and provided accurate implant localization along with minimal damage to associated neural structures.—*Journal abstract*.

3591. Olton, David S. (Johns Hopkins U.) **Specific deficits in active avoidance behavior following penicillin injection into hippocampus.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 957-963.—Studied acquisition of 2-way active avoidance and subsequent response suppression following unilateral injections of penicillin or sodium sulfadiazine into the septum, hippocampus, or entorhinal area of 46 Long-Evans hooded rats. 10 controls were unoperated and 10 were anesthetized and then returned to their cages. Injections of penicillin into hippocampus markedly disrupted active avoidance behavior, while leaving active escape behavior intact; in passive avoidance, the 1 S which met criterion for testing was unimpaired. Injections of penicillin into other closely related limbic areas (septum or entorhinal area), and control injections of sodium sulfadiazine had no effect on these behaviors. Results indicate that the behavioral importance of epileptiform activity within the hippocampus is distinctly different from such activity in other limbic areas, and that it is probably incorrect to

characterize seizure activity within the hippocampus as a functional ablation. (15 ref.)—*Journal abstract*.

Electrical Stimulation

3592. Amit, Z., Stern, Muriel H., & Wise, R. A. (McGill U., Montreal, Quebec, Canada) **Alcohol preference in the laboratory rat induced by hypothalamic stimulation.** *Psychopharmacologia*, 1970, Vol. 17(5), 367-377.—Wistar rats were induced to drink alcohol solutions by electrical stimulation in the lateral hypothalamus. They increased their home-cage intake of alcohol over that of control Ss. Changes in alcohol-directed behavior continued after termination of the brain stimulation treatment. Experimental Ss developed preferences for alcohol over water tolerance for increasing doses of alcohol dependence. They consumed alcohol that was contaminated with quinine. The data suggested the development of addiction to alcohol solutions.—*Journal abstract*.

3593. Davis, R. E. & Hirtzel, M. S. (U. Michigan, Mental Health Research Inst.) **Environmental control of ECS-produced retrograde amnesia in goldfish.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1089-1092.—Enhanced the retrograde amnesic effect of ECS by exposing goldfish to the intertrial environment for 25 min. just prior to administration of ECS. As the interval between training and ECS was increased, the amnesia produced by the Environment \times ECS interaction took longer to develop. The environment-dependent effects of ECS relate to those of other amnesic agents previously described. (15 ref.)—*Journal abstract*.

3594. Fanardzhyan, V. V. & Pogosyan, R. I. (Orbeli Inst. of Physiology, Erevan, USSR) **Reaktsiya kletok Purkin'e kory mozghechka koshki na razdrashenie oblasti fastigial'nogo yadra.** [Purkinje cellular reaction in the cat cerebellar cortex to stimulation of the region of the fastigial nucleus.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 987-994.—Numbutalized cats were Ss in an intra- and extracellular study of (a) the spontaneous and evoked activity of the Purkinje cells in response to stimulation of the region of the fastigial nucleus, (b) the antidromic discharges and focal potentials, arising in the cortex of the anterior lobe of the cerebellum under such stimulation, and (c) the various criteria for differentiating the antidromic and trans-synaptic responses of the Purkinje cells. Analysis of the synaptic excitation of Purkinje cells suggests the differentiation of 2 distinct types of responses: (a) a single response with a latent period of over 1 msec., and (b) a group response observed against a background of marked neuronal depolarization. The reactions were connected with activation of the Purkinje cells by the moss and curling fibers, respectively. (English summary) (15 ref.)—*I. D. London*.

3595. Karamyan, A. I., Belekova, M. G., & Veselkin, N. P. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **O skhodstve i razlichii talamo-telentsfala'noi sistemy golovnogo mozga amfibii i reptilii.** [On the similarity and difference of the thalamotelencephalic system of the amphibian and reptilian brain.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 977-986.—Examined several electrophysiological features dealing with the organization of the thalamotelencephalic system, which served as basis for both the similarities and differences encountered in the higher nervous activity of amphibians (frogs: *Rana temporaria* and *ridibunda*) and reptiles

(tortoises: *Emy orbicularis* and *Testudo horsfieldi*). The foci of the visual and somatic cortical representatives, and the zones of their overlap were determined. It was found that in the 1st 2, cells predominated which are connected with 1 form of sensitivity; and in the zones of overlap, convergent polymodal neurons predominated. However, the frog thalamus was a much more diffusely organized center. The most important differences between frogs and tortoises located in the forebrain are detailed. Evoked responses to electrical stimulation of the structures of the dorsal and ventral thalamus were recorded in frogs in the region of the primordial hippocampus, but in tortoises in the zone of the general cortex. They possessed similar properties: the capacity to (a) facilitate in the process of low-frequency (1-6/sec) rhythmic stimulation—the recruitment effect, and (b) maintain prolonged facilitation (up to 8 min.) after preliminary low- and high-frequency (1-10/sec and 100/sec, respectively) stimulation—postactivation potential. (English summary) (45 ref.)—*I. D. London.*

3596. Lidsky, T. I., Levine, Michael S., Kreinick, Carol J., & Schwartzbaum, J. S. (U. Rochester) **Retrograde effects of amygdaloid stimulation on conditioned suppression (CER) in rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 135-149.—In disagreement with an earlier report by G. U. Goddard, bilateral low-level stimulation of the amygdala of 67 male albino Holtzman rats failed to exert any retrograde effect upon acquisition and extinction of conditioned suppression of licking responses. Although conditions were sensitive to brain dysfunction produced by amygdaloid lesions, various tests with subseizure intensities of amygdaloid stimulation yielded negative findings. Market impairments in performance were found with retrograde and anterograde application of amygdaloid seizures. But the diffuse spread and prolonged effect of such seizures precluded any assessment with this technique of an amygdaloid role in consolidation of memory. The latter assumption still awaits experimental verification. (28 ref.)—*Journal abstract.*

3597. Manaster, Margaret S. (U. Kansas) **Feeding and self-stimulation compared when "positive" and "aversive" hypothalamic sites are stimulated independently and in combination.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 416-417.

3598. McGaugh, James L. & Landfield, Philip W. (U. California, School of Biological Sciences, Irvine) **Delayed development of amnesia following electroconvulsive shock.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1109-1113.—Gave ECS to 222 male Swiss-Webster mice in Exp. I, either 8 or 20 sec. following 1 training trial on an inhibitory avoidance task. A retention test was given 1, 6 or 24 hr. later. In the 20-sec ECS delay groups, retention performance was high at the 1-hr test but low at the 6- and 24-hr tests. In the 8-sec ECS delay group the retention performance was low at both the 1- and 24-hr tests. Response latencies 1 hr. following treatments were not increased by ECS only or ECS following a noncontingent footshock. Exp. II examined state-dependency interpretations of these effects. Ss received either ECS or no ECS 20 sec. after a training trial. 1 wk. later Ss received either an ECS or no ECS 1 hr. prior to a retention test. Reinstatement of the ECS state did not enhance retention: the 2nd ECS did not produce high retention latencies in Ss given post-training ECS. Findings are consistent with the view that amnesia develops as short-term memory processes

decline following ECS. (18 ref.)—*Journal abstract.*

3599. Mendelson, Joseph. (Rutgers State U.) **Lateral hypothalamic stimulation: Inhibition of aversive effects by feeding, drinking, and gnawing.** *Science*, 1969(Dec), Vol. 166(3911), 1431-1433.—In an experiment with 8 albino and hooded rats it was found that the opportunity to engage in feeding, drinking, and gnawing behavior facilitated by localized hypothalamic stimulation can delay the onset of the aversive effects of the stimulation and may completely suppress them. This suggests that the aversive effects of the stimulation are due to the excessive arousal of a drive. (19 ref.)—*Journal abstract.*

3600. Nachman, Marvin. (U. California, Riverside) **Limited effects of electroconvulsive shock on memory of taste stimulation.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 31-37.—88 male Sprague-Dawley rats which drank saccharin for 5, 10, or 30 sec. and were made sick 5 min. later by an injection of lithium chloride (LiCl) learned to avoid drinking saccharin again. An ECS given immediately after 30 sec. of saccharin drinking had no effect on the learned saccharin aversion, while ECS given immediately after 5 or 10 sec. of saccharin drinking produced some amnesic effects. Results are consistent with the idea of a brief temporal gradient for ECS effects although, even at short temporal intervals, amnesic effects occurred in only a small percentage of Ss. The relatively limited effects of ECS are interpreted to be a result of the particularly strong type of learning used. In Exp. II, ECS was found to be ineffective as a UCS in producing learned taste aversion.—*Journal abstract.*

3601. Narikashvili, S. P., Kadzhaya, D. V., & Timchenko, A. S. (Inst. of Physiology, Tbilisi, USSR) **O znachenii raznykh sloev dorsal'nogo naruzhnogo kolenchatogo tela v proiskhozhdenii otvetov asotsiativnoi oblasti kory golovnogo mozga koshki.** [On the significance of the various layers of the dorsal lateral geniculate body in the origin of the responses of the associative area of the cat cerebral cortex.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 948-956.—Unanesthetized curarized and chloralosed cats served as Ss. With threshold single electrical stimulation of the upper 2 layers (A and A₁) of the dorsal lateral geniculate body, a response arose only (or mostly) in the visual cortex. With the same stimulation of the lower layer (B), the response arose only (or mostly) in the associative cortex. With suprathreshold stimulation of the upper 2 layers, an associative response occurred with the primary response; with the same stimulation of the lower layer, the primary response occurred with an associative response. The effect of such stimulation is attributed to branching of the stimulating electrical current into the adjacent layers. After electrolytic lesion of the central part of the lower layer, the associative response to suprathreshold stimulation of the adjacent layers no longer occurred. After lesion of the lower layer, the response in the associative cortex vanished only for the light flash, while responses to stimulation of other modality was entirely unchanged. A response in the associative cortex occurred only on stimulation of the contralateral optic nerve. With stimulation of various layers by paired stimuli, the associative response was blocked only in the case where the lower layer (B) was stimulated by the conditionalizing stimulus. It is concluded that visual impulses, which bring on the occurrence of an associative response, as distinct from

impulses responsible for the arisal of the primary response, are switched in the lower layer (B) of the dorsal lateral geniculate body. (English summary) (26 ref.).—*I. D. London.*

3602. Phillips, Anthony G. (U. British Columbia, Vancouver, Canada) **Enhancement and inhibition of olfactory bulb self-stimulation by odours.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1127-1131.—In 3 experiments with 18 male Wistar rats, it was found that self-stimulation maintained by electrical stimulation of the olfactory bulb was increased at low current intensities, when a background odor of amyl acetate or peppermint was present. No effect was observed at optimal current intensities, nor did the odors enhance self-stimulation at control sites in the zona incerta and ventral premammillary nucleus of the hypothalamus. Malodorous quinine attenuated self-stimulation at olfactory bulb sites, but had no effect at control sites. Findings support the hypothesis that the effects of peripheral reinforcers are mediated by the self-stimulation areas of the brain. (20 ref.).—*Journal abstract.*

3603. Potash, Lawrence M. (U. Alberta, Edmonton, Canada) **Vocalizations elicited by electrical brain stimulation in *Coturnix coturnix japonica*.** *Behaviour*, 1970, Vol. 36(3), 149-167.—Electrical brain stimulation was used to locate neuroanatomical loci related to particular natural calls in reproductively ready male and female Japanese quail. All calls were tape recorded and accompanying motor activity noted. It was found that natural calls could be placed into 15 categories and that, according to sonographic analysis, brain stimulation elicited 10 of these categories. All brain stimulation elicited vocalizations could be changed by varying frequency-intensity parameters of the stimulus. Since trains of electrical stimuli elicited emissions resembling natural calls it is possible that some aspects of effector modulation underlying these vocalizations may be centrally patterned. (German summary) (22 ref.).—*S. R. Goldstein.*

3604. Pryor, Gordon T. & Otis, Leon S. (Stanford Research Inst., Menlo Park, Calif.) **Persisting effects of chronic electroshock seizures on brain and behavior in two strains of rats.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1053-1055.—Gave 30 male Fischer rats minimal, maximal, or sham ECS seizures daily, 5 times/wk for 6 wk. beginning at 30 days of age. Groups were sacrificed 48 hr., 2 or 6 wk. after the last treatment. The initial depression in body weight and increase in cortical brain weight by the maximally convulsed group recovered to control values by 6 wk. MAO activity was elevated throughout the brain 48 hr. after the last treatment and remained so in the ventral cortex for 6 wk. The 30 buffalo rats exhibited only the decreased body weight and elevated MAO activity after 6 wk. of treatment; treatment for 10 or 12 wk. produced some of the other changes observed in Fischer and Wistar strains. Treatment for 6 wk. did not affect acquisition of a successive brightness discrimination in an underwater T maze in either strain when tested 48 hr. or 4 wk. after the last treatment. Acquisition of a pole-displacement conditioned avoidance response was depressed in both strains at both test intervals.—*Journal abstract.*

3605. Wiener, Neil I. (York U., Toronto, Ontario, Canada) **Electroconvulsive shock induced impairment and enhancement of a learned escape response.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 971-974.—Administered single or multiple ECS treat-

ment to 217 male hooded rats in 3 experiments, 5 min., 30 min., or 1, 3, 5, 7, 14 or 31 days following shock escape training in a Y maze and retested them 24 hr. later. Both single and multiple ECS induced performance loss if administered 7 or 14 days following training. However, only multiple ECSs induced performance decrement when administered 5 or 30 min. after training. Retest performance was facilitated by single or multiple ECSs administered 31 days after training. No significant performance changes were evident following other training-treatment intervals. Physostigmine (anticholinesterase) injection prior to retest augmented the effect of a single ECS, producing a pattern of performance alteration resembling that found to result from multiple ECSs. Scopolamine (anticholinergic) eliminated the effects of a single ECS. (18 ref.).—*Journal abstract.*

3606. Zvartau, E. E., Makarov, A. Yu., Goncharova, V. A., & Alekseeva, E. I. (1st Medical Inst., Leningrad, USSR) **O korrelyatsii mezhdu izmeneniem sod-erzhaniya serotonina i adrenalinopodobnykh veshchestv v krovi i likvore i povedencheskimi reaktsiyami pri razdrazhenii gipotalamusa.** [On the correlation between behavioral reactions and change in level of serotonin and adrenaline-like substances in the blood and cerebrospinal fluid when the hypothalamus is stimulated.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1196-1202.—In 25 cats behavioral reactions were elicited by electrical stimulation of various structures of the hypothalamus—"the most important integrative center of behavior." Such stimulation changed the level of serotonin in the blood and heightened its level considerably in the cerebrospinal fluid. Changes in serotonin level in the cerebrospinal fluid correlated with the change in its concentration in the venous blood. The type of behavioral reaction known as "true rage [directed aggressiveness]," elicited by stimulation of the hypothalamus, was accompanied by the release of serotonin and adrenaline-like substances into the blood and of serotonin into the cerebrospinal fluid. Serotonin level was raised in arterial blood in the case of electrically elicited "fear" and "escape" reactions. (English summary) (23 ref.).—*I. D. London.*

ELECTRICAL ACTIVITY

3607. Anan'ev, V. M. **Mnozhestvennoe otvedenie bioelektricheskikh potentsialov, ikh kommutatsiya i avtomaticheskii analiz.** [Multiple recording of bioelectrical potentials, their commutation and automatic analysis.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 202-227.—Examines the possibility of developing, on the basis of electroencephalography, a single method of multiple-point registration of bioelectrical potentials from different organs and systems in man and animals. Several problems concerned with lead-offs of bioelectrical potentials are discussed, and a system for the commutation of many signals in semiconductors is described. A system is also developed for the complete automatic analysis of electrophysiological data through computer techniques—an analysis consisting of preliminary amplitude analysis, followed by mathematical treatment of the data of the preliminary analysis, utilizing composite programs.—*I. D. London.*

3608. Antonova, I. G. & Shipova, N. V. (Pediatric Medical Inst., Leningrad, USSR) **O svoistvakh myshtsy, napryagayushchei barabannuyu pereponku**

koshki, i tsentral'noi regulatsii ee sokrashchenii. [On the properties of the tensor tympanic muscle in the cat and of the central regulation of its contractions.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1225-1232.—Ss were 46 cats, 10 under ether narcosis, 26 decerebrated, and 10 encephale isolé. EMGs were recorded along with m. tensor tympani mechanograms by means of mirror isometric or isotonic myographs. The muscle displayed a comparatively long duration of single contraction (contractile phase of about 60 msec.). Superposition of single contractions occurred with low frequencies of stimulation. There was a similarity between the contractile properties of the muscle and those of the slow fibers of the external ocular muscles. Tensor tympanic muscle action potentials had a complex multiphasic form when the mandibular nerve and the nucleus of the trigeminal nerve were stimulated. The muscle had a motor representative in the cerebral cortex. In each hemisphere there were 2 zones: the middle part of the anterior cruciate gyrus, and the middle-inferior part of the anterior suprasylvian gyrus. (English summary) (15 ref.)—*I. D. London.*

3609. **Astardzhyan, G., Radov, Khr., Nachev, Ch., & Boev, K. Informatsionno-tsifrovoye ustroystvo dlya analiza ritmicheskikh biologicheskikh protsessov opredelennogo klassa.** [Digital informational apparatus for analysis of rhythmic biological processes of a certain class.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45: Issue 3) 102-117.—Describes the principle underlying the action of an apparatus for the analysis of disturbances of cardiac rhythm, respiration, and rhythmic processes of the digestive tract. A method for analyzing these disturbances is developed.—*I. D. London.*

3610. **Babskii, E. B. (Ed.) Metody sbora i analiza fiziologicheskoi informatsii.** [Methods for the gathering and analysis of physiological information.] Moscow, USSR: Nauka, 1969. 303 p.—Presents a collection of 37 articles on (a) the gathering and analysis of information in cardiology, (b) methods of biotelemetry and stimulation, and (c) the application of various electronic apparatus. The collection represents an issue of the series *Problemy Biologicheskoi Kibernetiki* [Problems of Biological Cybernetics].—*I. D. London.*

3611. **Bert, J., et al. (Centre National de la Recherche Scientifique, Lab. de Neurophysiologie Appliquée, Marseille, France) A comparative sleep study of two Cercopitheciinae.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 32-40.—Studied the sleep patterns of the 2 genera of Cercopitheciinae, *Papio papio* (baboon) and *Macaca mulatta* (rhesus). EEGs and oculograms were recorded from implanted skull screws. While both genera were readily identifiable as having primate sleep patterns, there were 2 major differences: (a) baboons showed more rhythmic activity and transient paroxysmal activity; and (b) with regard to distribution of sleep in stages, baboons had a lack of Stage 4 against the 16.6% of rhesus, less of Stage 3 (12.3%), but more of Stage 2 (55.4%) than the rhesus, which had 19.7% of Stage 3 and 34.6% of Stage 2. (French summary) (18 ref.)—*Journal summary.*

3612. **Bremer, Frédéric. (U. Bruxelles, Belgium) Inhibitions intrathalamiques récurrentielles et physiologie du sommeil.** [Intrathalamic recurrent inhibition and the physiology of sleep.] *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 1-16.—Tested the hypothesis that the induction of sleep

involves an increase of intrathalamic inhibition of the recurrent axonal type using encephale isolé cats. Comparison of the voltage, shape, and duration of the potentials recorded at different levels of vigilance of the brain demonstrated that arousal results regularly in a reduction of their amplitude, up to their complete suppression, while sleep and sleep-like conditions are associated with their increase. It is concluded that an increase in intrathalamic inhibition, resulting from the reduction or the suppression of the energizing action of the ascending reticular system, plays an important role in the immediate determinism of slow sleep in the cat. (39 ref.)—*English summary.*

3613. **Bruno, Louis J., Davidowitz, Jacob, & Hefterline, Ralph F. (Columbia U.) EMG waveform duration: A validation method for the surface electromyogram.** *Behavior Research Methods & Instrumentation*, 1970(Sep), Vol. 2(5), 211-219.—Examined the EMG recorded with surface electrodes using a triggered oscilloscope technique. When all but the high-amplitude waveforms in a given segment of activity were excluded from analysis, it was found that the duration of the remaining waveforms was specific to the muscle that produced them. That is, waveforms of a given duration were recorded whenever conventional indices—observable contraction, joint movement, needle recordings—showed activity in a specific muscle. This led to the suggestion that waveform duration might be used to validate the surface EMG. The suggestion, which is limited by the need to control posture and electrode placement, both of which may influence waveform duration, is illustrated in application to psychological research. (23 ref.)—*Journal abstract.*

3614. **Bulygin, I. A. & Soltanov, V. V. (Inst. of Physiology, Minsk, USSR) Novye dannye ob osobennostyakh interotseptivnoi i eksterotseptivnoi afferentnoi impul'satsii.** [New data on the features marking intero- and exteroceptive afferent impulsion.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 995-1002.—Used cats under ether anesthesia in an electrophysiological study replicating previous work with frogs. Qualitative differences were established in afferent innervation of the intestine and the skin of the hind leg, also confirmed morphologically. In the peripheral end of the intestinal nerves, connected with the empty terminal part of the small intestines, afferent impulsion was recorded by mechanical (stretching) and chemical (acetylcholine) stimulation. The impulsions were characteristic for A (mostly delta) and C fibers, classified by speed of propagation of spike potentials, evoked by single right-angular impulses. In the peripheral end of the cutaneous nerve of the hind leg, afferent impulsion was recorded, in response to analogous stimulation of the cutaneous receptors, afferent impulsion, characteristic chiefly for A (beta, gamma, and delta) fibers and considerably less frequently for C fibers, defined by the same indices. All the afferent fibers of the cutaneous nerve, and also the A afferents of the intestinal nerve, are cerebrospinal since they degenerated peripherally after prior section of these nerves several days before the experiment. The C afferents of the intestinal nerves are centripetal branchings of the peripheral afferent neurons, since they maintained their intactness and retained their functional capacity peripherally after prior section. Earlier conclusions are confirmed concerning the qualitative features marking the afferent link of the intero- and exteroceptive reflexes. (16 ref.)—*I. D. London.*

3615. Colgan, D. M. (Victoria U., Wellington, New Zealand) **Effects of instructions on the skin resistance response.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 108-112.—Examined effects of instructions on component responses of the skin resistance response. 2 groups of 4 male and 7 female undergraduates each were given 30 presentations of signal lights, with shock following on 50% of trials after 6-sec interstimulus interval (ISI). On the 15th trial, 1 group was told how to predict shock, and the other was given dummy instructions. Results show that: (a) responses occurring in the ISI, and those occurring after the point of shock onset, declined in magnitude for predictable nonshocked trials; (b) in disagreement with previous evidence, responses to shocked trials remained constant after shocks became predictable; and (c) contrary to previous evidence, interruption effects of instructions did not diminish postshock-point responses. Data suggest that component responses of the skin resistance response reflect simple changes in arousal mechanism activity.—*Journal abstract*.

3620. Hobson, J. Allan. (Harvard Medical School, Boston, Mass.) **Sleep after exercise.** *Science*, 1968(Dec), Vol. 162(3861), 1503-1505.—Found that after moderate treadmill exercise, marked decreases in operant responding and in latency to onset of behavioral sleep occurred in 10 male cats with electrodes implanted for long-term electrographic recording. The sleep produced is characterized by enhancement of synchronized EEG activity with suppression of the desynchronized phase. The result is consistent with the theory that a function of synchronized sleep is to facilitate recovery from fatigue.—*Journal abstract*.

3621. Irmiš, F., Radil-Weiss, T., Lát, J., & Krekule, I. (Psychiatric Research Inst., Prague, Czechoslovakia) **Inter-individual differences in hippocampal theta activity during habituation.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 24-

31.—Investigated changes in theta rhythm during an acoustic stimulus (1150 cps) lasting for 10 sec. and repeated at 50-sec intervals using 21 male albino rats with electrodes implanted in the dorsal hippocampus. The average frequency and total duration of the theta rhythm during presentation of the 1st 10 stimuli represented individually stable values. Results were in positive significant correlation. Both parameters were in positive correlation with individual differences in the nonspecific excitability level derived from the intensity of exploratory activity on repeated exposure of Ss to a new environment. Both the frequency and duration of the theta rhythm decreased as a function of stimulus repetition. The rate of decay was maximal during the 1st-4th presentations of the stimuli. A significant positive correlation was found between the duration and average frequency of theta rhythm and between its frequency during the 1st sec. of its occurrence and its duration. (French summary) (22 ref.)—*Journal summary*.

3622. Jacobs, Barry L., Harper, Ronald M., & McGinty, Dennis J. (U. California, Los Angeles) **Neuronal coding of motivational level during sleep.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1139-1143.—Recorded stable increases or decreases in the discharge rate of single neurons from the ventral diencephalon and midbrain during sleep following manipulation of the hunger level of freely moving cats. These changes were larger during paradoxical than slow wave sleep. Control data indicate that in the absence of any external manipulation neuronal activity is stable from 1 sleep session to another. 3623. Klukowska, Lidia & Tokarski, Juliusz. (Medical Academy, Lublin, Poland) **Plasticity of the spinal preparation and changes in the reflex excitability.** *Acta Physiologica Polonica*, 1969, Vol. 20(4), 529-537.—Investigated the extent the spinal preparation reveals the plastic type effects. 120 frogs, *Rana temporaria*, served as Ss. The spinal cord was transected at the calamus scriptorius level, the lower $\frac{1}{3}$ of the semitendinosus muscle was isolated, and the iliac cutaneous nerve was prepared. Reflex contractions of the semitendinosus muscle were obtained due to electric irritation of the iliac cutaneous nerve, by a series of multiple supramaximal impulses taken from the multi-vibratory stimulator. Records were made on the kymograph. The flexion reflex elicited in the spinal frog produced an aftereffect in the form of excitability depression, the depth of which depended on the duration of afferent stimulation. The changes in excitability revealed the character of long-term changes. It is concluded that plastic mechanisms exist at the level of the spinal cord. (18 ref.)—*Journal abstract*.

(Defence Research Establishment, Toronto, Ontario, Canada) **A discriminator and integrator device for multi-unit neural activity analysis.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 83-84.—Describes a cheap, reliable discriminator and integrator device for the specific analysis of multiunit neural activity. Only solid-state components are used. Several options are available for displaying the instrument output. (French summary)—*Journal summary*.

3625. Lassi, N. I. (1st Medical Inst., Leningrad, USSR) **O spontanno' sokratitel'noi aktivnosti prodol'nogo i kol'tsevo'go sloev muskulatury matki u neberemennykh i beremennykh koshek.** [On spontaneous and cyclic activity of the longitudinal and circular muscle layers of the uterus in nonpregnant and pregnant cats.]

taneous contractile activity of the longitudinal and circulatory layers of musculature in nonpregnant and pregnant cats.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1282-1287.—21 nonpregnant and 37 pregnant Ss were used to study (a) the spontaneous contractile activity of the longitudinal and circular musculature of 1 of the uterine horns (in situ and in vitro), and (b) the change in this activity in the transition of the S from the nonpregnant to the pregnant state. Spontaneous contractions were identical in both layers. In nonpregnant Ss the muscles of both layers exhibited relatively frequent, continuous, and low amplitude contractions (Type A); in pregnant Ss they exhibited relatively infrequent, distinctly discrete, and high amplitude contractions (Type B). Type A contractions were present in vitro in circular muscles, Type B contractions being present in the longitudinal muscles. It is concluded that, in the absence of pregnancy, spontaneous contractions in the myometrium are the work of the uterine circular muscle layer with its sympathetic motor innervation and that, in pregnancy beyond the initial period, spontaneous myometrial contractions are the work of the longitudinal uterine muscle layer with its parasympathetic motor innervation. (English summary) —*I. D. London*.

Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 178-181.—Describes an electronic stimulator which can present a series of electrical impulses and immediately thereafter present a single delayed test impulse with a uniformly regulated interval of delay (in msec.).—*I. D. London*.

3627. Nicholls, J. G. & Baylor, D. A. (Harvard Medical School, Boston, Mass.) **Long-lasting hyperpolarization after activity of neurons in leech central nervous system.** *Science*, 1968(Oct), Vol. 162(3850), 279-281.—Made intracellular recordings from the cell bodies of sensory neurons within isolated ganglia of leeches. After a train of impulses, the membrane potential of sensory neurons was increased for several min. by an electrogenic pump. During this hyperpolarization, the sensitivity of the membrane potential to external potassium ions was increased, so that physiologically occurring increases in potassium concentration could influence synaptic processes.—*Journal abstract*.

3628. Nozdrach'ev, A. D. (Pavlov Inst. of Physiology, Leningrad, USSR) **Elektrofiziologicheskaya kharakteristika afferentnoi i efferentnoi impul'satsii v vegetativnykh nervakh v khronicheskom eksperimente.** [Electrophysiological characteristics of afferent and efferent impulsion in the autonomic nerves in chronic experiment.] *Fiziologicheskii Zhurnal SSSR*, 1966(Jan), Vol. 52(1), 46-56.—14 alert dogs were used to study the character of afferent and efferent impulsion recorded from electrodes chronically implanted in the major splanchnic nerve and in the postganglionic branches of the inferior mesenteric ganglion. 2 types of potentials for afferent impulses were observed: (a) slow potentials with an amplitude of up to 10-12 microV., and (b) rapid oscillations with a large biphasic amplitude from 12 microV. to higher. The presence of group discharges, synchronous with breathing and the pulse, was a characteristic feature of afferent impulsion. The

potentials of efferent impulsion, similarly recorded, appeared most often in synchrony with cardiac activity and breathing (amplitude from 15-30 microV. when grouped; from 10-15 microV. when ungrouped). An increase in both afferent and efferent impulsion was observed in acute experiments, on injection of acetylcholine solution and on painful stimulation with electric current. This impulsion was depressed after injections of adrenaline and physiological solution.—*I. D. London*.

3629. Rozenshtaukh, L. V., Yur'ev, S. A., & Yushmanova-Rakova, A. V. **Primenenie elektrometricheskikh usilitel'ei postoyannogo toka dlya issledovaniya vnutrikletochnykh potentsialov miokarda.** [Application of electrometric amplifiers of direct current for the study of myocardial intracellular potentials.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 88-102.—Examines the characteristics of electrometric amplifiers of direct current with positive and negative feedback. Their basic circuits are presented, and results of applying these amplifiers to the study of the action potentials of different parts of the heart in the presence of vagal inhibition are analyzed.—*I. D. London*.

3630. Schneider, M. & Gerin, P. **Une méthode de localisation des dipôles cérébraux.** [A method of localization of cerebral dipoles.] *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 69-78.—Studied theoretically the distribution of the electrical field on the plane limiting surface of a homogeneous medium containing a dipole source. The key points in the variations of the electrical field make it possible to define a method to determine the coordinates of the dipole and its direction. Some aspects of the study were verified directly in animal experiments, simulating the dipole by an artificial source. This analysis was applied to epileptic discharges recorded on the human scalp. It was found that for certain focal activities it is possible to determine the localization of the corresponding focus. For diffuse activities the dipole source demonstrated consisted only of an electrical equivalent, the value of which for the interpretation of EEGs is discussed. (22 ref.)—*English summary*.

3631. Sutin, Jerome & Michael, Richard P. (Emory U., Medical School) **Changes in brain electrical activity following vaginal stimulation in estrous and anestrus cats.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1043-1051.—Studied changes in the electrical activity of the cerebral cortex and hypothalamus in response to vaginal probing in female behaviorally estrous and anestrus cats. Low frequency spikes or slow waves occurred following 15 of 121 vaginal probes in all 20 Ss. 11 of these 15 responses were in behaviorally anestrus Ss. In 13 Ss, 7 of which were behaviorally estrous, high amplitude spindle activity appeared in the EEG following vaginal probing. There was no relation between cortical or hypothalamic electrical activity and the behavioral or hormonal status of Ss. Spikes or slow waves in the hypothalamus were also produced by nonspecific stimuli such as tail pinch, particularly in Ss in which pulmonary ventilation was manipulated to alter end-tidal CO₂. (30 ref.)—*Journal abstract*.

3632. Vaughan, Herbert G., Gross, Elliott G., & Bossom, Joseph. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Cortical motor potential in monkeys before and after upper limb deafferentation.** *Experimental Neurology*, 1970(Feb), Vol. 26(2), 253-262.—Trained 4 rhesus monkeys to perform wrist extension

at regular intervals. The motor potential (MP) and EMG associated with these movements were recorded before, and in 2 Ss after dorsal rhizotomy extending from C2 to T4. Although wrist extension of the deafferented limbs appeared superficially normal, the contractions developed more slowly and were more prolonged. There was also a substantial increase in the interval between onset of cortical and muscular activity—corticomuscular delay (CMD)—as well as increased variability of CMD. These changes could be attributed in part to reduced spinal excitability due to deafferentation. Despite the marked changes in timing, the configuration of the MP was unaltered. It is suggested that kinesthetic feedback is not registered in motor cortex during the performance of skilled movements. (16 ref.)—*Journal abstract*.

The advantages and disadvantages of using the mouse for electrophysiological experimentation are discussed. Male Swiss Webster mice served as Ss.—*Journal abstract*.

Electroencephalography & Evoked Potentials

3637. Bennett, Thomas L. (Sacramento State Coll.) **Hippocampal EEG correlates of behavior.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 17-23.—Examines 3 task variables which may have accounted for previously reported divergent results regarding the function of the hippocampus as reflected by its electrical activity. These variables include modality of stimuli, presence of an alerting signal, and whether the rewarded and unrewarded stimuli were presented successively or simultaneously. The modality of the positive

stimulus and whether the rewarded and unrewarded stimuli are presented successively or simultaneously did not have a differential effect on the electrical activity of the hippocampus and adjacent entorhinal cortex of 8 adult cats. Results imply that theta rhythm reflects an alert or attentive state and the role of the hippocampus in response inhibition. It is concluded that although some of W. Adey's findings suggest that the hippocampus plays a general role in learning, the possibility that his findings instead reflect the role of this structure in mediating complex orienting responses cannot be ruled out. (French summary)—*Journal summary*.

3638. Crown, Peter D. (U. Arizona) **Visual evoked potentials during EEG autocontrol in man.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 410.

3639. Fields, Craig. (Rockefeller U.) **Visual stimuli and evoked responses in the rat.** *Science*, 1969(Sep), Vol. 165(3900), 1377-1379.—Presented male Long-Evans hooded rats with a series of visual stimuli, each described by shape, size, and position. Cortical recordings were made in medial and lateral positions of rat visual cortex. Average responses were calculated and correlated. Data reveal that information regarding size was contained in electrical activity from medial areas, and information regarding shape in electrical activity from lateral areas.—*Journal abstract*.

3640. Harris, Martin S. **Binaural interaction and laterality: Comparison of cortical evoked potentials produced by clicks and tone pip stimuli.** *U.S. Naval Submarine Medical Center Report*, 1969(Oct), No. 599, 14 p.—Studied laterality and binaural interaction at the level of the auditory cortex in 3 cats. The evoked potentials in response to acoustic stimuli of clicks and tone-pips were picked up using bilateral macroelectrodes on the posterior ectosylvian gyri. The problem was drawn from existent knowledge of homolateral/contralateral relationships in the animal, and studies in the human which have indicated asymmetry of function in the cerebral hemispheres related to verbal and nonverbal properties of acoustic stimulation. Equal intensity clicks, and 1- and 2-kHz tone pips were used. Results demonstrate binaural interaction but show no evidence that the different kinds of acoustic stimuli are systematically related to binaural interaction or homolateral/contralateral relationships. Failure to find asymmetry of function for the acoustic stimulation used is discussed in light of the verbal-nonverbal distinction for human Ss. (27 ref.)—*Journal abstract*.

3641. Harter, M. Russell & White, Carroll T. (U. North Carolina, Greensboro) **Evoked cortical responses to checkerboard patterns: Effect of check-size as a function of visual acuity.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 48-54.—In an experiment with 8 21-43 yr. old Ss, the size of checks comprising checkerboard patterns and the degree of focus influenced certain components of visually evoked cortical responses (VER). The amplitude of these components varied nonmonotonically with check-size. The check-size which elicited responses of greatest amplitude depended on the magnitude of induced refractive error and thus on visual acuity. When the patterns were sharply focused, relatively small checks elicited responses of greatest amplitude. When the patterns were progressively defocused, progressively larger checks elicited the greatest responses. It is concluded that the amplitude of VERs appears to be

related to the smallest check-size which was clearly perceived. (French summary) (18 ref.)—*Journal summary*.

3642. Massopust, L. C., et al. (Cleveland Psychiatric Inst., Lab. of Neurophysiology, O.) **Electroencephalographic characteristics of brain cooling and re-warming in monkey.** *Experimental Neurology*, 1970(Mar), Vol. 26(3), 518-526.—Subjected 7 male rhesus monkeys to extracorporeal autocerebral perfusion hypothermia. 3 Ss were continuously perfused after brain temperature reached 15° C for 30 min. and 4 were subjected to circulatory arrest for 30 min. after intracerebral temperatures fell to 15° C. In either case, EEG showed a gradual decrease in the amplitude of the major frequency, followed by a loss of the major frequency, then a decrease in amplitude of the minor frequency with continuous slowing. Finally, low amplitude theta frequencies only were present; these became isoelectric at intracerebral temperatures of 22-19° C. It took about 35 min. to cool the brain from 37-15° C. On rewarming, but before recovery of the S, it took approximately 3 hr. before EEG activity approached prehypothermic frequencies and amplitudes with intracerebral temperatures reaching 34° C within 25 min. after initiation of rewarming. Cerebral blood flow changes and changes in cellular membrane permeability probably contribute to the long latency in return of EEG activity.—*Journal abstract*.

3643. Nazarov, V. A. **Avtomaticheskii analiz EEG na ETsVM "URAL-2."** [Automatic EEG analysis on the "URAL-2" electronic computer.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 228-233.—Describes a method for the automatic analysis of EEGs, recorded by means of a method developed by V. M. Anan'ev. The principle underlying the analysis, and the necessary changes in the logical structure of separate operations in the computer utilized are presented.—*I. D. London*.

3644. Regan, D. & Cartwright, R. F. (U. Keele, Staffordshire, England) **A method of measuring the potentials evoked by simultaneous stimulation of different retinal regions.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 314-319.—Describes a method designed to minimize the variability in the gross electrical responses of the brain (evoked potentials) to successive presentations of identical visual stimuli. Potentials evoked by stimulation of the left and right $\frac{1}{2}$ -fields of 1 eye by almost identical visual stimuli are measured simultaneously. The 2 brain signals are extracted from a high noise level (10-50 times greater than the signal) by 2 analogue Fourier analyzers and results are presented in a quantitative form. 2 stimulus modulation frequencies are generated which differ by a small amount, variable from ± 1 to ± 8 cps. Once the frequency difference is set it will remain constant with time (e.g., a frequency difference of $3 \pm 1\%$ over 1 hr.). The device uses a differential gear driven by an electronically stabilized variable speed motor. Intensity and pattern double-stimulators are described which minimize the effects of light scattered within the eye, and which provide complementary information. Applications to clinical problems, including migraine, are discussed. (French summary) (21 ref.)—*Journal summary*.

3645. Rhodes, John M., et al. (U. New Mexico) **Primate electrophysiology, particularly related to sleep.** *USAF ARL Technical Report*, 1969(Mar), No.

69-5, 74 p.—In a series of studies evaluating sleep in lower primates it was possible to demonstrate that sleep staging criteria are more similar to humans than lower animals. However, within the primate scale the lower primates have shorter stages and interspecies differences. These interspecies differences suggest the possibility of studying specific stages more advantageable in 1 species than another. From the definition of primate sleep similarities it was possible to study sleep deprivation effects. The deprivation effects are similar to man at the extreme level, that is deep sleep (Stage 4 and paradoxical) is the 1st to recover and is most necessary for recovery of basic function. However, the evidence was highly suggestive that the recovery of lighter sleep stages (particularly Stage 2) was related to recovery of a subjective sense of well-being. This latter aspect would appear to be most crucial for the return of good decision making. In other studies investigating electrical activity of the lower primate brain under conditions of rapid decompression, it was found that EEG correlates were early prognosticators of a return to performance. It was also possible to identify, in the chimpanzee, an electrical rhythm recordable from the uncus that was related to the emotional significance of an odor. Other work covered describes how cortical temperature differs from lower primates to lower mammals, evoked response differences within different primate species, biochemical differences between parenteral and ventricular injections. (109 ref.)—*Journal abstract*.

3649. Umezaki, H. & Morrell, F. (Kyushu U., Neurological Inst., Fukuoka, Japan) **Developmental study of photic evoked responses in premature infants.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 55-63.—Studied 1226 averaged photic evoked responses (PER) at 29-43 wk. postconception in 31 prematurely born infants. The wave form, peak latencies, and distribution of responses were correlated to postconceptional age. Results show that: (a) PERs were localized at the occiput in premature Ss and tended to spread outside the occipital area with increasing age; (b) PERs were initially negative before 32 wk. with an initially positive wave appearing after

approximately 35 wk. of postconceptional age; (c) peak latencies decreased with increasing age, but the estimation of postconceptional age was unreliable because of the considerable individual variability; and (d) relative amplitude of the 2nd positive peak (III) to the 1st negative peak (II) increased with postconceptional age. Possible mechanisms compatible with results are discussed according to the morphophysiological studies on evoked responses in animal experiments. (French summary) (36 ref.)—*Journal summary*.

3650. Venator, E. R., Andy, O. J., Koshino, K., & Frothingham, R. E. (U. Mississippi, Medical Center, Jackson) **Septum after-discharge effects upon cortical photic-evoked responses.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 64-68.—Evaluated the effects of septum after-discharges on photic evoked responses in the lateral gyrus and the anterior medial suprasylvian gyrus of 16 adult cats. The early negative components of the responses evoked in the lateral gyrus were attenuated by the after-discharges, but no other consistent effects were observed. No relationship between evoked potential effects and qualities of the after-discharges was found. It is concluded that the alteration of sensory input obtained may explain some of the behavioral impairments observed during psychomotor seizures of limbic origin. (French summary)—*Journal summary*.

SENSORY PHYSIOLOGY

3651. Baker, Chester H. & Hall, Robert J. (Human Factors Research, Goleta, Calif.) **Cutaneous sensitivity: A review of some literature, problems and approaches.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1969(Dec), No. 21-69, 121 p.—Examines some of the research on cutaneous sensitivity over the last 15 yr. A review of the literature on tactile communications and pain has been omitted. Apparatus, procedures and findings are outlined in Part I. Part II attempts to show where data from different experiments appear to be, or not to be, consistent, and discusses the problems and difficulties that confront the scientist engaged in cutaneous research. Recommendations for further research are confined to behavioral measures of the skin senses. (375 ref.)—*Journal abstract*.

3652. Laget, P. **Codes et codages en neurophysiologie sensorielle.** [Codes and coding in sensory neurophysiology.] *Journal de Psychologie Normale et Pathologique*, 1970(Apr), Vol. 67(2), 133-149.—Recent progress in neurophysiology, particularly those aspects resulting from the systematic treatment of information gained at a cellular level, have led to the concept of coding. A rigorous definition of formal properties of nerve codes has been found useful, as well as codes based upon statistical properties of the distribution of intervals on patterns of temporal distributions. Though it is relatively simple to discover unique nerve elements, code systems are very difficult to analyze when multiple conductors are involved. Nevertheless, coding seems a promising approach in the analysis of peripheral and central nerve phenomena, particularly in the domain of sensory physiology.—*L. A. Ostlund*.

3653. Landolt, Jack P. (Defence Research Establishment, Toronto, Ontario, Canada) **Neural properties of pigeon lingual chemoreceptors.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1151-1160.—Investigated the neural properties of the pigeon lingual

chemoreceptor mechanism from electrophysiological data extracted from the peripheral laryngo-lingual nerve; a branch of the IX nerve trunk. Ss were cross-bred from strains of Homer, King, Carneau, and common. Of 32 chemicals tested individual pigeon variations are noted to many solutions. Salt and acid solutions are very effective stimuli; solutions commonly associated with the sweet or bitter taste sensation in man are notably ineffective as stimuli in the pigeon. In most instances there is good correlation between electrophysiological and behavioral response. A new measure, the ionic stimulating efficiency factor derived from both the relative effectiveness measure and response rise time data shows a ranking of $\text{NH}_4^+ > \text{K}^+ > \text{Na}^+ \geq \text{Ca}^{++}$ and $\text{Cl}^- > \text{Br}^- = \text{I}^-$ for several salt solutions. Both anions and cations are involved in chemoreception. L. M. Beidler's fundamental taste equation can be fitted to NaCl response data but only above a certain threshold value of .2M concentration. Acetic acid data does not appear to fit Beidler's equation. Burst-like clusters and pattern temporal variation are prominent features of single-fiber activity. Intensity coding is mediated by both fiber recruitment and impulse frequency variation. (36 ref.)—*Journal abstract*.

3654. Riggs, Lorrin A. & Sternheim, Charles E. (Brown U.) **Human retinal and occipital potentials evoked by changes of the wavelength of the stimulating light.** *Journal of the Optical Society of America*, 1969(May), Vol. 59(5), 635-640.—Compared wavelength-discrimination functions for 3 different stages in the processing of visual signals. Responses at an early retinal stage were recorded by use of a contact-lens electrode attached to the cornea of the eye. Occipital scalp electrodes recorded potentials evoked at the cortical level. Finally, the Os made psychophysical judgments of the corresponding differences of hue. Electrical responses were evoked by rapid shifts from one wavelength to another within a set of vertical stripes that made up the visual field. In favorable regions of the spectrum—near 495 and 595 nm modulation (nm.), small (4-7 nm.) shifts of wavelength evoked measurable occipital potentials and produced noticeable changes of the perceived hue. Much larger differences (20-25 nm.) were required, however, to elicit retinal responses. This suggests that an enhancement of wavelength-discriminating signals must take place at some stage between the bipolar layer of the retina and the striate area of the cortex.—*Journal abstract*.

3655. Tapper, Daniel N. (Cornell U., New York State Veterinary Coll.) **Behavioral evaluation of the tactile pad receptor system in hairy skin of the cat.** *Experimental Neurology*, 1970(Mar), Vol. 26(3), 447-459.—Evaluated the behavioral relevance of the tactile pad receptor (TPR) system in hairy skin by use of a conditioned avoidance procedure wherein 4 adult cats were trained to raise their forepaw in response to minute tactile stimuli in a graded series of pressures confined to the epidermal pads, structures in which the mechanoreceptors are located, and immediately adjacent skin. Ss could perceive and respond to stimuli introduced into a single sensory unit of the TPR system and displayed greater sensitivity than when the stimuli were applied to surrounding skin. No loss in selective sensitivity or general level of sensitivity was produced by section of the dorsal spinal funiculus. Section of both the dorsal and dorsolateral funiculi resulted in general loss in light tactile sensitivity and precluded a more subtle evaluation

of specific receptor sensitivity. (17 ref.)—*Journal abstract.*

3656. Wald, George. (Harvard U.) **Molecular basis of visual excitation.** *Science*, 1968(Oct), Vol. 162(3850), 230-239.—Reviews past and current research in the biological aspects of vision. It is observed that "some of the most significant aspects of the photoreceptor process come from its being laid out in 2 dimensions: on the molecular level, in 2-dimensional arrays of oriented molecules...; and on the cellular level, in the single layer of receptor cells that composes the retinal mosaic." Because technology now permits the measurement of separate retinal units, it is possible to sample "through their differences in spectral absorption and sensitivity, the properties and behavior of each receptor type over the surface of such highly variegated retinas as that of man." (76 ref.)—*P. McMillan.*

BIOCHEMISTRY

3657. Deaux, Edward; Sato, Earl, & Kakolewski, Jan W. (Antioch Coll.) **Emergence of systemic cues evoking food-associated drinking.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1177-1179.—20 male Holtzman albino rats maintained on a feeding schedule of 8 1.5 gm. portions of Purina Lab Chow/day consistently initiate drinking following food ingestion. To establish whether systemic cues accompany the onset of drinking, 10 Ss were sacrificed and serum osmolality was determined. The control group was sacrificed at the time of day they normally received the 1st portion of food. The experimental group was sacrificed at the moment of initiation of drinking following consumption of the 1st portion of food. The difference in serum osmolality between the groups indicates that a systemic cue had emerged at the time of initiation of drinking.—*Journal abstract.*

3658. Engel, Jerome. (Stanford U., Medical School, Palo Alto, Calif.) **Turnover of RNA in normal and secondarily epileptogenic rabbit cortex.** *Experimental Neurology*, 1970(Feb), Vol. 26(2), 221-238.—Autoradiographically examined nuclear, nucleolar, and cytoplasmic RNA turnover in neurons and neuronal populations of normal and secondarily epileptogenic cortex. 14 white male rabbits with "mirror foci" and implanted epidural electrodes, and 9 normal controls with and without implanted electrodes were injected iv with tritiated uridine. Additional autoradiographic observations were made on Ss with mirror foci 8 hr. after iv administration of tritiated cytidine, adenosine, and guanine. Average grain counts made 15 min. and 1, 8, and 24 hr. after drug administration, for all of the uridine-injected Ss within each time group revealed that the nuclear label decreased from 81.1% of the total intracellular label at 15 min. to 54.3% by 24 hr. whereas cytoplasmic label increased from 12.8% at 15 min. to 39.7% at 24 hr. Nucleolar label was greatest (13.6%) at the 1-hr time interval. No average differences in these nuclear/nucleolar/cytoplasmic ratios were observed between epileptogenic and nonepileptogenic neuronal populations. At the cellular level great variability in intracellular grain content and location was observed within every population, but the only finding consistently characteristic of the mirror foci areas was the presence of nests of dense neurons which stained darkly with RNA-specific azure B but contained little or no intracellular label. The staining properties and intracellular grain patterns were not seen when the sections

were pretreated with RNase. It is concluded that the time course of RNA synthesis and turnover calculated here is in agreement with other reports for neurons of the mammalian CNS. The only finding peculiar to epileptogenic tissue, in the interictal state, was the presence of neurons with increased RNA-staining properties but decreased incorporation of RNA precursors. (37 ref.)—*Journal abstract.*

3659. Frankenhaeuser, Marianne & Rissler, Anita. (U. Stockholm, Psychological Lab., Sweden) **Effects of punishment on catecholamine release and efficiency of performance.** *Psychopharmacologia*, 1970, Vol. 17(5), 378-390.—Studied physiological and psychological reactions in 40 male university students. In Session 1 Ss received electric shock in a random schedule they could not influence. In Sessions 2 and 3 a choice-reaction task was performed; 1/2 the Ss were punished for slow performance. The degree of control exerted by the Ss was greater in Session 3. Session 4 had the Ss in passive relaxation. Punishment produced a rise in adrenaline and noradrenaline release. By increasing Ss' control over the situation the adrenaline increase was counteracted, while the noradrenaline release was unaffected. Ss with high adrenaline and noradrenaline excretion were more efficient in speed and accuracy of performance. (15 ref.)—*Journal abstract.*

3660. Kakolewski, Jan W. & Deaux, Edward. (Antioch Coll.) **Influence of sham stomach loading on serum osmolality.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1205-1206.—In an experiment with 21 female Holtzman albino rats, stomach sham-loading was accompanied by a significant increase in serum osmolality which was highly correlated with the time involved in the sham-loading procedure. A decrease in serum osmolality followed a stomach loading of 8 ml. of distilled water, but the change was smaller than that observed to follow oral ingestion of the same volume of water.—*Journal abstract.*

3661. Kudrin, A. N. & Vorob'ev, V. G. **Aminoketony.** [The aminoketones.] Moscow, USSR: Meditsina, 1970. 328 p.—Based on the authors' own research in the field of the beta-aminoketones and on the data of the literature, a book on the biological, pharmacological, and clinical aspects of the aminoketones, among which are "active adrenolytics, spasmolytics, antagonists of angiotensin, antiarrhythmic and neurotropic agents" and whose "broad spectrum of pharmacological activity is connected with their influence on the processes of excitation and inhibition in the central and peripheral nervous system and also in the striped and smooth musculature."—*I. 3662. Mandell, Arnold J. & Spooner, Charles E. (U. California, Irvine) **Psychochemical research studies in man.** *Science*, 1968(Dec), Vol. 162(3861), 1442-1453.—Presents current theory and methodology in research attempting to relate biochemical phenomena to brain function in man, with particular relevance to behavioral states. Reservations concerning the establishment of any substance as a physiological modulator or transmitter in the CNS are discussed. 4 research strategies currently in use are described. (105 ref.)—*Journal summary.*

3663. Meyerson, Bengt J. (U. Uppsala, Sweden) **Monoamines and hormone activated oestrous behaviour in the ovariectomized hamster.** *Psychopharmacologia*, 1970, Vol. 18(1), 50-57.—Estrous behavior was activated by estradiol/progesterone treatment in

ovariectomized hamsters. Amine depletors, reserpine and tetrabenazine, did not reduce the estrous behavior while an inhibitory effect was obtained by the MAO inhibitors, pargyline and nialamide. When dihydroxyphenylalanine or 5-hydroxytryptamine was combined with pargyline, the inhibitory effect was enhanced.—*P. Federman.*

3664. Nordgren, Richard A., Woodruff, Diana S., & Bick, Michael D. (U. Southern California) **The effect of exogenous RNA on the retention of discriminative learning in the rat.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1169-1171.—To test the hypothesis that administration of RNA affects behavior by providing a supply of precursors for de novo synthesis of RNA, the effect of whole RNA was compared to that of an alkaline hydrolysate. 28 male Long-Evans rats were trained on a discrimination task and divided into 4 groups of equal mean performance on the task. Each group received 1 of the following treatments: whole RNA injection, hydrolysate RNA injection, saline injection, no injection. No significant difference was observed in the mean performance of the 4 groups after injections. It is concluded that RNA did not affect learning or retention of a discrimination task. Since the procedure of some experiments demonstrating the positive effect of RNA on learned behavior was to repeatedly inject Ss with RNA over long periods of time, while in the present study Ss were injected only once, the difference in results may have been due to experimental differences in the injection schedule.—*Journal abstract.*

3665. Sandberg, H. E. & Piette, L. H. (U. Hawaii, Medical School) **EPR studies of psychotropic drug interactions at cell membranes.** *Agressologie*, 1968, Vol. 9(1), 59-67.—Interaction of equal concentrations of perphenazine, chlorpromazine, and promazine with maleimide spin labeled ghosts produced a reversible conversion of weakly immobilized spin labels. Results demonstrate the usefulness of the spin label technique in studying the interaction of drug molecules with membranes. The reaction of chlorpromazine free radical with bound spin label indicates that the free radical moiety penetrates the membrane to the site of the strongly immobilized spin labels.—*M. Daniels.*

(Indiana U., Kokomo) **Brain RNA hydrogen bonding in young and old rats after metrazol-induced convulsion.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1071-1072.—Used the reaction of nucleic acid with formaldehyde to investigate brain RNA hydrogen bonding in 6 young and 6 old Carworth Farms rats after metrazol-induced convulsion or control treatment. The degrees of hydrogen bonding for the young-convulsive, young-nonconvulsive, old-convulsive, and old-nonconvulsive conditions were estimated to be 52.9 ± 3 , 52.6 ± 2.9 , 47.4 ± 7.5 , and $52.4 \pm 2.9\%$ respectively. Differences among these values were not statistically significant.—*Journal abstract.*

Hormones

3667. Adler, N. T., Resko, J. A., & Goy, R. W. (U. Pennsylvania) **The effect of copulatory behavior on hormonal change in the female rat prior to implantation.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1003-1007.—The concentration of progesterone in systemic plasma of female Sprague-Dawley rats was proportional to the amount of copulatory stimulation they received when they were in heat. Within 6 hr. after mating, 7 Ss receiving more than 9 intromissions (high

intromission group) had significantly higher quantities of this hormone in their blood than 7 Ss receiving no copulatory stimulation (control group). 5 Ss in the high intromission group showed steadily increasing concentrations of progesterone over the 4 days following mating, while 9 Ss receiving a small number of intromissions (low intromission group) or no intromissions (control group) did not show this increase. In addition to progesterone, the female rat is known to secrete a 2nd, weaker, gestational hormone: 20α -OH-pregn-4-ene-3-one. On the 4th day after mating, the ratio of progesterone to 20α -OH-pregn-4-ene-3-one in the high intromission group was 1.1 compared to .43 for the low intromission group and .21 for the control group. Thus, sufficient stimulation from the male rat's copulatory intromissions initiates a neuroendocrine reflex in the female; the result of this reflex is an elevated concentration of progesterone in the female soon after coitus, followed by the maintained secretion characteristic of pregnancy. (30 ref.)—*Journal abstract.*

3668. Anton-Tay, Fernando; Chou, Chuan; Anton, Sylvia, & Wurtman, Richard J. (Massachusetts Inst. of Technology) **Brain serotonin concentration: Elevation following intraperitoneal administration of melatonin.** *Science*, 1968(Oct), Vol. 162(3850), 277-278.—The ip administration of melatonin to female Sprague-Dawley rats caused an increase in brain serotonin concentration, especially in the midbrain. This effect could be demonstrated within 20 min. of melatonin administration and was not associated with changes in norepinephrine concentration. (19 ref.)—*Journal abstract.*

3669. Avakyan, O. M. & Pogossyan, A. V. (Inst. of Fine Organic Chemistry, Erevan, USSR) **O potentsirovani sokrashchenii semyavynosyashchego protoka katekholaminami.** [On potentiation of the contractions of the spermatic duct with catecholamines.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 25-28.—Isolated guinea pig vasa deferentia were utilized in a study to determine the role of the ganglionic structures, distributed around the entrance of the hypogastric nerve into the spermatic duct, in the considerable intensification of the contractile reaction of the isolated organ in response to either transmural electrical stimulation or electrical stimulation of the hypogastric nerve under the influence of noradrenaline and adrenaline. Noradrenaline and adrenaline (8 microgm/ml) increased the contractions of isolated spermatic duct with electrical stimulation of the hypogastric nerve. After removal of the ganglionic structures around the entrance of the nerve into the organ and transmural stimulation of the spermatic duct, the catecholamines intensified the reaction. The magnitude of the effect was increased after depletion of noradrenaline through the action of reserpine. Adrenaline potentiated the responses of vasa deferentia to a much greater degree than did noradrenaline. Why this is so is unclear since the nerves of vas deferens are noradrenergic.—*J. D. London.*

3670. Baranov, V. G., et al. (Pavlov Inst. of Physiology, Leningrad, USSR) **Sopostavlenie gonadotropnoi funktsii gipofiza s urovnem katekholaminov i neirosekretornoj aktivnost'yu u krys.** [Comparison of hypophyseal gonadotropic function with catecholamine level and neurosecretory activity in rats.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 1020-1027.—Female rats (with normal sexual cycle, in constant heat, and ovariectomized) served as Ss. Results of (a) biolog-

ical determination of the luteinizing (LH) and follicle-stimulating hormones in the hypophysis and of the hypothalamic factor (LH-RF), eliciting the excretion of the LH from the hypophysis, were compared with the results of (b) the histological study of the anterior lobe of the hypophysis along with catecholamine level and secretory activity of all parts of the hypothalamo-hypophyseal neurosecretory system. The findings are presented in considerable detail. (English summary) (46 ref.).—*I. D. London.*

3671. Beatty, William W., Powley, Terry L., & Keesey, Richard E. (North Dakota State U.) **Effects of neonatal testosterone injection and hormone replacement in adulthood on body weight and body fat in female rats.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1093-1098.—Administered testosterone or oil injections to 36 Holtzman female rats at 3 days of age. Upon reaching adulthood, each treatment group was divided into 3 subgroups that were either (a) ovariectomized and given prolonged estrogen injections, (b) ovariectomized and given oil injections, or (c) sham-operated and given oil injections. In agreement with previous findings, the infant testosterone treatment increased body weight (significant increases from control levels appeared by 28 days of age) and decreased ovarian weight. Ovariectomy in adulthood produced quantitatively similar increases in body weight whether or not testosterone had been administered in infancy. Similarly, estradiol was equally effective in both infant testosterone and control groups in blocking this increase in weight following ovariectomy. However, estradiol reduced the weight of ovariectomized and testosterone-treated Ss only to levels characteristic of other testosterone-treated but non-ovariectomized Ss, never to normal control levels. Results are interpreted as indicating that testosterone in infancy chronically alters or reorganizes a central nervous mechanism responsible for regulating body weight; but, this mechanism retains its responsiveness to the normal weight-suppressing effects of estrogen following such treatment. Observations indicating parallel effects of estrogen upon weight and body fat, particularly in the inguinal fat organs, are also reported.—*Journal abstract.*

3672. Brockway, Barbara F. (2175 Tabor Dr., Denver, Colo.) **Hormonal and experiential factors influencing the nestbox oriented behaviour of budgerigars (*Melopsittacus undulatus*).** *Behaviour*, 1969, Vol. 35(1-2), 1-26.—"Estrogenic material can induce both virgin and experienced males to perform nestbox-oriented behaviour. The presence or absence of testicular androgens, or of exogenous androgenic material, does not prompt males to perform any nestbox-oriented behaviour. Virgins are less responsive than are experienced males. Females seem more easily induced, by hormonal manipulations, to perform nestbox-oriented behaviour than are males with similar backgrounds and given identical treatments."—*N. M. Ginsburg.*

3673. Edwards, David A. & Herndon, James. (Emory U.) **Neonatal estrogen stimulation and aggressive behavior in female mice.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 993-995.—Compared the effects of neonatal and androgenization and neonatal estrogenization on the development of mechanisms for aggressive behavior in Swiss-Webster mice. Female Ss were given either estradiol benzoate (EB) or testosterone propionate (TP) on the day of birth. Other females were given a control injection of oil on the day of birth; male

Ss received an injection of oil on the day of birth. As adults all Ss were gonadectomized, given replacement therapy with TP, and tested in pairs for fighting. 92% of the 13 pairs of females given EB at birth fought following androgen replacement therapy in adulthood. Only 25% of the 12 pairs of females given oil at birth fought in adulthood. 100% of the males (N = 22) and 100% of the females given TP (N = 24) on the day of birth fought in adulthood. It is concluded that administration of estrogen to neonatal female mice facilitates the differentiation of androgen sensitive mechanisms for adult aggressive behavior. In this regard, neonatal estrogenization appears to mimic the effects of neonatal androgenization.—*Journal abstract.*

3674. Edwards, David A. & Thompson, Michael L. (Emory U.) **Neonatal androgenization and estrogenization and the hormonal induction of sexual receptivity in rats.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1115-1119.—Compared male rats, neonatally androgenized and normal females for the induction of receptivity by estrogen stimulation alone or by combined administration of estrogen and progesterone. Neonatally estrogenized females were also compared with neonatally androgenized females, to determine to what extent neonatal estrogenization exactly mimics neonatal androgenization. 31 female Sprague-Dawley Ss were given an injection of testosterone propionate, estradiol benzoate, or oil at birth. 11 male Ss were given oil at birth. As adults, all Ss were gonadectomized and tested for sexual receptivity following administration of estrogen alone, or estrogen and progesterone. Females given oil at birth showed moderate levels of sexual receptivity when administered estrogen alone. Levels increased as estrogen was increased. At each dose level, females given oil at birth and estrogen and progesterone in adults showed higher levels of receptivity than females given only estrogen. Male Ss, and androgenized and estrogenized females failed to show significant receptivity at any dose level of estrogen stimulation, whether or not progesterone was also given. It is concluded that a major effect of neonatal androgen stimulation, exogenous or endogenous, is an inhibition of the development of estrogen sensitive systems for lordotic behavior. In this regard, neonatal estrogenization appears to mimic the effects of neonatal androgenization.—*Journal abstract.*

3675. Fiske, Virginia M. & Huppert, Leonore C. (Wellesley Coll.) **Melatonin action on pineal varies with photoperiod.** *Science*, 1968(Oct), Vol. 162(3850), 279.—In an experiment with 95 female Sprague-Dawley rats, it was found that administration of melatonin can prevent the diurnal rhythm of serotonin concentration characteristic of the pineal organ. Whether or not such a change is induced depends upon the point in the photoperiod when the hormone is injected. This observation indicates that the action of melatonin is affected by the photic environment of the recipient.—*Journal abstract.*

3676. Hutchison, J. B. (Sub-Dept. of Animal Behaviour, Madingley, England) **Differential effects of testosterone and oestradiol on male courtship in Barbary doves (*Streptopelia risoria*).** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 41-51.—Sexually experienced male Barbary doves displayed sexual behaviors ranging from "complete" to "incomplete." These behaviors were modified after 8-10 successive daily tests with females, apparently reflecting effects of experience. The role of endocrine factors underlying the devel-

opment and maintainancy of some sexual behaviors were studied by treating castrated males im with testosterone propionate or estradiol monobenzoate and observing sexual behaviors for 16 successive days with females. Testosterone failed to induce test soliciting in males that did not display this behavior, but reestablished it to precastration levels in males that did display it. Estradiol induced this behavior in all Ss. Less chasing was induced by estradiol than by testosterone in males displaying complete courtship patterns prior to castration. Testosterone induced 50% of castrates to display bowing; estradiol did not induce this behavior. (18 ref.)—G. Greenberg.

3677. Michael, Richard P. & Zumpe, D. (Bethlem Royal Hosp., Beckenham, England) **Aggression and gonadal hormones in captive rhesus monkeys (*Macaca mulatta*)**. *Animal Behaviour*, 1970(Feb), Vol. 18(1), 1-10.—Studied aggressive interactions between pairs of adult rhesus monkeys of opposite sexes quantitatively during 1019 hr. of observation extending over 2.5 yr. The levels of aggression by both males and females changed with pregnancy, ovariectomy, and the administration of gonadal hormones (estradiol, progesterone, and testosterone propionate). Ovariectomy increased the overall level of aggression, particularly, that of the male. In contrast, pregnancy and the administration of hormones to females diminished aggression by males and increased their tolerance of aggression by females. There is evidence that estradiol administration directly increases female aggressivity while progesterone does so indirectly by diminishing female receptivity and her tolerance of male mounting attempts. (36 ref.)—*Journal summary*.

3678. Pfaff, Donald W. (Rockefeller U.) **Autoradiographic localization of radioactivity in rat brain after injection of tritiated sex hormones**. *Science*, 1968(Sep), Vol. 161(3848), 1355-1356.—Radioactivity was found in cell bodies of neurons and glial cells throughout brains of male and female rats injected with either testosterone- H^3 ($N = 8$) or estradiol- H^3 ($N = 8$). Uptake by limbic and hypothalamic structures was higher and longer lasting than that in nonlimbic structures. In all brains, the preoptic area, prepiriform cortex, olfactory tubercle, and septum had particularly high, long-lasting uptake of both hormones.—*Journal abstract*.

3679. Pushkarev, Yu. P. (Pavlov Inst. of Physiology, Leningrad, USSR) **Analiz deistviya katekholaminov i serotoninina na vegetativnye ganglii**. [Analysis of the action of the catecholamines and serotonin on autonomic ganglia.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 22-25.—42 cats under chloralose-urethane narcosis were used in a comparative study of the influence of the catecholamines and serotonin on the different stages of synaptic transmission in sympathetic ganglia with undisturbed blood supply. The catecholamines and serotonin in physiological doses displayed opposite effects on synaptic transmission in sympathetic ganglia. In most cases the catecholamines inhibited this transmission; serotonin facilitated it. The deterioration of synaptic transmission, produced by adrenaline (1-1 microgm/kg), noradrenaline (3-5 microgm/kg), and large doses of serotonin (3-10 microgm/kg) occurred due to a decrease in the excitatory action of the presynaptic termini. The sporadic facilitation of synaptic transmission, which was observed following the administration of small doses of amines, was seen as the result of an

increase in the excitability of the ganglionic cholinergic receptive structures.—I. D. London.

3680. Schmidt, Robert S. (Loyola U., Hines, Ill.) **Preoptic activation of mating call orientation in female anurans**. *Behaviour*, 1969, Vol. 35(1-2), 114-127.—Tree frogs and Fowler's toads were induced to ovulate by injecting gonadotrophin and progesterone. Gravid females oriented toward tapes of conspecific male mating calls. Nongravid females and males made no observable response to mating calls. "Testing of females with forebrain lesions showed that the telencephalon and the dorsal part of the preoptic area are not necessary for orientation behavior, but that the region of the ventral magnocellular preoptic nucleus is essential."—N. M. Ginsburg.

[Symposium on the Endocrine Mechanisms for Regulating the Adaptation of the Organism to Muscular Activity.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1307-1309.—Presents summaries of a number of the papers read at the 1969 symposium held in Kyaeriku, USSR.—I. D. London.

3682. Zumpe, D. & Michael, Richard P. (Bethlem Royal Hosp., Beckenham, England) **Redirected aggression and gonadal hormones in captive rhesus monkeys (*Macaca mulatta*)**. *Animal Behaviour*, 1970(Feb), Vol. 18(1), 11-19.—Describes threat behavior characterized by being directed away from the sexual partner in 5 oppositely-sexed pairs of adult rhesus monkeys. It was established that threatening-away did not occur in response to any external, environment stimulus, but did vary with the sexual activity of the pair. When male sexual interest in the female was high, male threatening-away was more frequent and intense. Threatening-away by females increased when female receptivity was increased either by subcutaneous injections or by brain implants of estrogen. When female receptivity was reduced by progesterone administration, female threatening-away also declined. It is argued that threatening-away behavior is redirected aggression and functions to consolidate the bonds between sexual partners. (32 ref.)—*Journal summary*.

Drug Effects—Human

3683. Back, Kurt W., et al. **Physiological and situational factors in psychopharmacological experiments**. *Psychophysiology*, 1970(May), Vol. 6(6), 749-760.—Investigated some psychological and physiological reactions to introduction of chlordiazepoxide hydrochloride to an experimental situation involving a conformity trial. Groups of 4 male undergraduates were selected with either considerable previous acquaintance (friends) or little acquaintance (strangers). In each group, 2 Ss were given an injection of the drug and 2 an injection of saline. Conformity to false group feedback was measured on a Crutchfield-Gerard apparatus and arousal was measured in terms of the plasma free fatty acid (FFA) level. Self-ratings of mood were obtained using the Nowlis Adjective Check List. It was found that the experimental manipulations of group composition or drug injection did not yield clear-cut results unless the Ss were divided according to initial ratings of anxiety. Ss initially more anxious, who were administered the drug and who were tested as strangers, show greater con-

formity to group pressure and a continuous increase in physiological arousal. These conditions are interpreted as being cumulative sources of strain, under which Ss concentrate on monitoring themselves to the exclusion of attending to surrounding events.—*Journal abstract.*

3684. Bowes, W., Brackbill, V., Conway, E., & Steinschneider, A. (U. Colorado) **The effects of obstetrical medication on fetus and infant.** *Monographs of the Society for Research in Child Development*, 1970(Jun), Vol. 35(4), 55 p.—Explores the effects of maternally administered drugs upon the fetal milieu, and discusses some of the implications of these effects for the development of the child.—*A. Barclay.*

3685. Clark, Lincoln D., Hughes, Ronald, & Nakashima, Edwin N. (U. Utah, Medical Center, Behavioral Sciences Lab.) **Behavioral effects of marihuana: Experimental studies.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 193-198.—Presents evidence from an experiment with 18 21-36 yr. old college-educated men that marihuana intoxication has significant effects on complex RT (largely through sporadic impairment of vigilance), recent memory, recall and comprehension of written information, and accuracy of time estimation. The drug was given by mouth as an alcohol extract. Experimental data (including the Digit-Code Memory and Iowa Silent Reading tests) and introspective reports suggest that the processes involved in selective perception (and, conversely, habituation to irrelevant stimuli), immediate recall of preceding thoughts in order to keep on track, and capacity for goal-directed systematic thinking are particularly sensitive to relatively low doses of marihuana. It is suggested that distortion of time sense is incident to these effects on perception, memory, and organization of thought. Research on possible long-term impairment in habitual marihuana users is indicated.—*Journal summary.*

3686. Coburn, Ronald F. (U. Pennsylvania, Medical School, Cardiovascular-Pulmonary Div.) **Enhancement by phenobarbital and diphenylhydantoin of carbon monoxide production in normal man.** *New England Journal of Medicine*, 1970(Sep), Vol. 283(10), 512-515.—9 normal human Ss were given a 7-day course of phenobarbital or diphenylhydantoin. With phenobarbital and diphenylhydantoin, respectively, total body heme, as estimated by carbon monoxide dilution, rose to an average of 114.8 ($p < .05$) and 109% ($p < .05$) of control levels. Rates of heme catabolism, determined by measurement of rates of carbon monoxide production, increased an average of 174 and 214% of normal ($p < .01$) with these 2 agents. The agents appear to have induced hepatic heme, and after "induction," catabolism of hepatic heme contributed over 50% of the total carbon monoxide production. (32 ref.)—*Journal abstract.*

3687. Cohen, S. **Drugs of hallucination: The uses and misuses of lysergic acid diethylamide.** London, England: Secker-Warburg, 1968.—Presents a history of LSD manufacture, and describes the chief characteristics of the drug's influence on the CNS along with those of other hallucinogens. The medical aspects of LSD use in general and in the process of psychotherapy are discussed.—*I. D. London.*

3688. Crane, George E. (Spring Grove State Hosp., Baltimore, Md.) **Cardiac toxicity and psychotropic drugs.** *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 534-539.—Reviews the literature of the cardiac effects of psychotropic drugs. Therapeutic doses of thioridazine and tricyclic antidepressants cause typical

EKG changes. The same drugs, particularly in excessive doses, may produce cardiac disorder or death. Chlorpromazine and other phenothiazines appear to be less toxic. There is also the possibility that benign EKG changes will eventually lead to permanent cardiac impairment. (57 ref.)—*Journal summary.*

3689. Hollister, Leo E. & Gillespie, Hamp K. (Veterans Administration Hosp., Palo Alto, Calif.) **Marihuana, ethanol, and dextroamphetamine: Mood and mental function alterations.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 199-203.—Treated 12 normal volunteer Ss with marihuana (median dose equivalent to 32 mg. tetrahydrocannabinol), ethanol (median dose 57 gm.), dextroamphetamine (median dose 15 mg.), and a marihuana placebo. Assignment to treatments was random over weekly intervals. Subjective responses based on a mood scale revealed increased stimulation and activity, and decreased drowsiness from dextroamphetamine as compared with placebo. Ethanol and marihuana decreased activity. Dextroamphetamine tended to improve performance on psychometric tests; the other 2 drugs tended to impair it. Time estimation was longer with marihuana than with the other treatments, yet because the latter were associated with gross underestimates, marihuana estimates most closely approximated the actual interval being estimated. Dextroamphetamine increased performance on the digit-symbol substitution test. Ethanol and marihuana increased simple RT. Marihuana and ethanol were most alike in their effects, with the exception of the alteration in time perception produced by the former drug. Dextroamphetamine was essentially unlike the other 2 drugs and improved, rather than impaired, performance even in nonfatigued Ss.—*Journal summary.*

3690. Idström, C. M. & Schalling, D. (Karolinska Hosp., Stockholm, Sweden) **Objective effects of dexamphetamine and amobarbital and their relations to psychasthenic personality traits.** *Psychopharmacologia*, 1970, Vol. 17(5), 399-413.—5- and 15-mg dexamphetamine and 150- and 300-mg amobarbital were studied in 2 groups of 22 military Ss, selected for extreme scores on a psychasthenia scale. The pattern of the drug effects was important after dexamphetamine and impairment after amobarbital, as compared to the placebo. Dexamphetamine gave few significant effects, except for cardiovascular measures. Significant effects were obtained after amobarbital in a number of tests. The treatment group interactions were related to a greater sensitivity to amobarbital in the high psychasthenic group. More significant effects were obtained after amobarbital as compared to the placebo in the high group, especially 1 hr. after 300-mg amobarbital. (26 ref.)—*Journal abstract.*

3691. Jones, Reese T. & Stone, George C. (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) **Psychological studies of marihuana and alcohol in man.** *Psychopharmacologia*, 1970, Vol. 18(1), 108-117.—Regular users of marihuana were given smoked and orally administered marihuana, alcohol, or a placebo. They were unable to distinguish between smoked marihuana and the placebo. The oral administration of marihuana (tincture of cannabis) produced dysphoric symptoms and was similar to alcohol in this respect. The smoked marihuana altered pulse rate, time estimation, and EEG, but had no effect on field dependence or digit symbol substitution tasks. Both drugs were mild intoxicants. (17 ref.)—*P. Federman.*

3692. Kales, Anthony; Kales, Joyce D., Scharf, Martin B., & Tan, Tjiauw-Ling. (U. California, Medical School, Los Angeles) **Hypnotics and altered sleep-dream patterns: II. All-night EEG studies of chloral hydrate, flurazepam, and methaqualone.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 219-225.—Evaluated 3 nonbarbiturate hypnotics—chloral hydrate (500 and 1000 mg.), flurazepam (30 mg.), and methaqualone (150 mg.)—using 8-night protocols. Ss were 20-30 yr. old healthy males. The administration of chloral hydrate in both dosages and of 150 mg. of methaqualone did not result in REM suppression nor did withdrawal produce a REM rebound. 30 mg. flurazepam produced a slight REM suppression but no REM rebound following withdrawal. 30 mg. flurazepam was the only drug to suppress Stage 4 sleep significantly. Beginning with the 2nd drug night, the decrease was progressive and marked and continued into the withdrawal period. Flurazepam (60 mg.) and methaqualone (300 mg.) were studied with 3- and 8-night protocols, respectively. Both produced definite REM suppression, and withdrawal of methaqualone also produced a REM rebound. The effectiveness of these drugs in inducing and maintaining sleep could not be adequately evaluated owing to the use of normal Ss. Definite trends, however, were established, with 1000 mg. chloral hydrate favorably reducing sleep latency and 30 mg. flurazepam favorably reducing both sleep latency and wake time after sleep onset. In conditions known to be exacerbated during REM sleep (e.g., coronary artery and duodenal ulcer disease), the physician is cautioned to avoid REM rebound when hypnotic drugs are used. It is stressed that any potential use of REM or Stage 4 suppressant hypnotics needs to be thoroughly investigated prior to general clinical use. (16 ref.)—*Journal summary*.

3693. Kruskal, William H. & Haberman, Shelby. (U. Chicago) **Chromosomal effect and LSD: Samples of four.** *Science*, 1968(Dec), Vol. 162(3861), 1508-1509.—Discusses problems of distinguishing between statistical significance and substantive significance in differences obtained when small samples are used in research. A study by R. S. Sparkes, J. Melnyk, and L. P. Bozzetti is used as an example of misimpressions that can be created. Additional comments on small-sample analyses are provided by F. W. Whitmore, and R. S. Sparkes, D. Thomas, J. Melnyk, and L. Bozzetti.—*P. McMillan*.

3694. Lader, M. H., Sakalis, G., & Tansella, M. (Crespigny Park Psychiatric Inst., London, England) **Interactions between sympathomimetic amines and a new monoamine oxidase inhibitor.** *Psychopharmacologia*, 1970, Vol. 18(1), 118-123.—Describes a safe method for the screening of new MAO inhibitors with respect to their potentiation of dietary and sympathomimetic amines. Studies of such a compound, clorgyline, and its interactions with oral tyramine and phenylphrine given orally to 3 doctor volunteers are described. Market potentiation of the bradycardia-inducing properties of the amines was found.—*P. Federman*.

3695. Lang, W. J. & Rand, M. J. (U. Melbourne, Victoria, Australia) **A placebo response as a conditional reflex to glyceryl trinitrate.** *Medical Journal of Australia*, 1969(May), Vol. 1(18), 912-914.—Glyceryl trinitrate consistently produced tachycardia with variable headache and palpitations in 8 normal female volunteers. After repeated administration of active

tablets, when placebos were substituted by means of a double-blind technique, tachycardia, occasional headache and palpitations resulted. Effects are interpreted as conditional responses established with the active tablet serving as the UCS and the placebo as the CS. Conditional responses can be induced in animals by means of a variety of drugs as the UCS. The occurrence of similar responses in man would be considered when conducting and interpreting clinical trials.—*Journal summary*.

3696. Lowenstein, Leah M., Simone, Rosemary; Boulter, Phillip, & Nathan, Peter. (Boston U., Medical School) **Effect of fructose on alcohol concentrations in the blood in man.** *JAMA: Journal of the American Medical Association*, 1970(Sep), Vol. 213(11), 1899-1901.—Fructose has previously been found to be the most effective experimental compound in increasing the metabolism of alcohol (ethanol). In this clinical study, fructose, glucose, or saline infusions were administered iv to Ss who simultaneously drank 300 ml of bourbon. Fructose infusions resulted in a lowering of the alcohol levels in the blood by 43% compared to the values obtained during saline solution infusions. Glucose infusions were ineffective. The lowering of the alcohol levels by fructose may occur because the dissociation of the nicotinamide alcohol dehydrogenase complex is accelerated by intermediary metabolites of fructose.—*Journal abstract*.

3697. Melges, Frederick T., Tinklenberg, Jared R., Hollister, Leo E., & Gillespie, Hamp K. (Stanford U., Medical School) **Temporal disintegration and depersonalization during marihuana intoxication.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 204-210.—In an experiment using double-blind controls, 8 normal men were given a placebo and 20-, 40-, and 60-mg marihuana extract calibrated for content of tetrahydrocannabinol. On a cognitive task and a subjective inventory it was found that the oral doses of marihuana extract induced Ss to confuse past, present, and future and to lose their goal-directedness. This temporal disintegration was related to increases in depersonalization for all 8 Ss. For each S studied separately, changes in temporal disintegration correlated positively with changes in depersonalization, indicating that these processes were dynamically interrelated. Overall findings indicate that the fragmentation of temporal experience and the accompanying depersonalization were euphorogenic. Euphoria often took place when Ss felt less concerned about future outcomes relevant to maintaining their usual sense self. (18 ref.)—*Journal summary*.

3698. Rigal, J., Savelli, A., & Juillet, P. (Hosp. Militaire d'instruction du Val-de-Grace, Service d'électroencephalographie et de neurophysiologie clinique, France) **Contribution à l'étude neurophysiologique du mode d'action des drogues psychotropes et en particulier des neuroleptiques, par la mise en évidence, chez l'homme, de leurs effets sur les systèmes effecteurs.** [Contribution to the neurophysiological investigation of the mode of action of psychotropic drugs and in particular the neuroleptics, as evidenced in man by their effects on regulatory systems.] *Agressologie*, 1968, Vol. 9(1), 153-157.—Examines the use in psychiatry of drugs with major neuroleptic activity accompanied by the appearance of various neurological manifestations predominantly extrapyramidal. These substances affect the regulating mechanisms of the

motor, tone, postural, and reflex activities. The study in man, of the reactivity of the spinal motor neuron with the appropriate neurophysiological technique, permits the evaluation of the state of excitability of the 2 large alpha and gamma systems of control of the terminal common pathway. The comparison of the responses obtained after the injection of various psychotropic drugs differentiated their respective effects on these regulating systems. It was observed that substances which cause a neuroleptic syndrome are those which cause an imbalance in the alpha and gamma levels of excitability. This concerns the substances which cause important modifications in the reflex responses, e.g., the major stimulant neuroleptics. Conversely, the sedative neuroleptics tend to depress these responses. Clinically, these results explain the paradoxical corrective action of a sedative neuroleptic on the manifestations that follow the administration of stimulant neuroleptics. However, the differences noted in the levels and delay of elimination of the various psychotropic drugs is a practical difficulty which should not be underestimated. —English abstract.

3699. Safer, Daniel J. (Johns Hopkins Hosp., Childrens Medical & Surgical Center, Baltimore, Md.) **The concomitant effects of mild sleep loss and an anticholinergic drug.** *Psychopharmacologia*, 1970, Vol. 17(5), 425-433.—37 males were tested in drug-alone, sleep-loss-alone, and sleep-loss-drug groups to determine the separate and combined effects of mild sleep loss and scopolamine hydrobromide. Scopolamine was administered iv in either a sedative dose or a low-deliriant dose; sleep deprivation was for either 1 or 2 nights. Scopolamine given after loss of sleep caused significantly more intense and prolonged psychotomimetic effects than were noted in the drug-alone condition. The results on sedation were not uniform. Ss who received a sedative dose following sleep deprivation showed increased somnolence; the reverse was true for the low-deliriant dose in the sleep-loss Ss.—Journal abstract.

3700. Safer, Daniel J. (Johns Hopkins Hosp., Childrens Medical & Surgical Center, Baltimore, Md.) **The effect of LSD on sleep-deprived men.** *Psychopharmacologia*, 1970, Vol. 17(5), 414-424.—13 males were tested for motor, attention, physiologic, and behavioral effects of 1.5 µg/kg of LSD taken orally after 1 or 2 nights' loss of sleep. 20 additional Ss were tested in 2 control categories: 1.5 µg/kg of LSD alone, and 1 night's sleep loss alone. The onset of characteristic LSD behavior and attention impairment was more rapid in Ss who received LSD after loss of sleep than in the drug-alone groups. The sleep-loss LSD Ss showed inaccuracies in problem solving and vigilance tests not present in the controls. Ss who received LSD after 2 nights' loss of sleep showed increases in pulse rate, pupil size, and 3-hr plasma levels of LSD.—Journal abstract.

3701. Saratikov, A. S. Kamfara. [Camphor.] Tomsk, USSR: Tomsk U., 1966. 275 p.—In this monograph on the pharmacology and clinical application of camphor, major attention is directed to (a) the biochemical mechanism of the cardiotonic effect produced by camphor, (b) the influence of camphor on the capillaries and regional circulation in the brain and heart, and (c) an analysis of its cholinolytic and adrenergic action.—I. D. London.

3702. Zingerman, A. M. (Inst. of Experimental Medicine, Leningrad, USSR) **O mekhanizmakh formirovaniya funktsional'noi aktivnosti regulatorynykh**

sistem golovnogo mozga cheloveka-operatora v veroyatnostnoi srede. [On mechanisms for formation of the functional activity of the regulatory systems in the brain of the human operator in a probability environment.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 940-947.—Utilized pharmacological analysis to determine (a) the features marking the reactions of the human operator to signals of varying probability ($1/4$, $1/2$, $1/4$, $1/8$), when the functional state of the cerebral regulatory systems has been changed, and (b) the role of cerebral functional systems and structures in executing these reactions. The influence of "probability of [occurrence of] an emergency situation," was simulated in the form of intense electrocutaneous pain reinforcement, and preparations were employed either to increase or decrease excitation and tension: adrenaline, melipramine, aminazine (chlorpromazine), and andaxine. The 1st 2 (stimulators) increased reactivity to the warning signals, promoting the differentiability of reactions to signals with varying probabilities of occurrence; the last 2 (tranquilizers) decreased both reactivity and differentiability of the reactions. Under the influence of the stimulators, no change was noted in the character of intersystemic interrelationships. Under the influence of the tranquilizers, the intersystemic intracentral interrelationships were distorted, with the reactions acquiring a paradoxical character. The most adequate reactions occurred against a background of melipramine action. Analysis of the data confirms the hypothesis assigning (a) a primary role to the adrenergic structures of the mesencephalic reticular formation and the amygdala in the formation of reactions to signals of high probability of occurrence, and (b) a leading role to the nonspecific formations of the thalamus, and also the hippocampus, in the formation of reactions to signals of low probability of occurrence. (English summary) (18 ref.)—I. D. London.

Drug Effects—Animal

3703. Absava, G. I. & Vysotskaya, N. B. (Inst. of Pharmacology & Chemotherapy, Moscow, USSR) **Vliyanie psikhostimulyatorov na dvigatel'nyu aktivnost' krya, a takzhe na vnutri- i vnekletochnoe sodержanie ionov kaliya i natriya v raznykh otdelakh golovnogo mozga.** [Influence of psychostimulators on the motor activity of rats and also on intra- and extracellular concentration of K and Na-ions in various sections of the brain.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 134-137.—White rats were administered 2.5 mg/kg phenamine and 12.5 mg/kg pyridol. The stimulating effect of these preparations was accompanied by an increase in Na⁺ ions and a decrease in K⁺ ions in the cells of the cerebral cortex, brainstem, and medulla oblongata. Reverse changes occurred in the respective extracellular distributions of these ions. The most pronounced changes in ionic composition were observed in the brainstem; the least, in the cerebral cortex. A correlation is noted between the developmental dynamics of the psychostimulating effect of phenamine and pyridol and changes in ionic composition.—I. D. London.

3704. Avakumov, V. M. & Batulin, Yu. M. (Inst. of Pharmacology & Chemotherapy, Moscow, USSR) **Sravnitel'naya kharakteristika raspredeleniya aminazina i khloratsizina u krya.** [Comparative characteristics of the distribution of aminazine and chlor-

acyzine in rats.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 14-17.—Rats were used in a spectrophotometric study of the level of aminazine (chlorpromazine) and of chloracyzine in the blood and tissues of the liver, brain, and heart at different intervals of time (30, 60, 120, 240, and 360 min.) subsequent to their administration. Aminazine level was higher in the cerebral tissues than for chloracyzine.—*J. D. London.*

3705. Bapna, J. S. & Dandiya, P. C. (S.M.S. Medical Coll., Jaipur, India) **Modification of the effects of antipsychotic agents on the "open field" performance of rats by treatment with α -methyl tyrosine or p-chlorophenylalanine.** *Psychopharmacologia*, 1970, Vol. 17(5), 361-366.—Studied "open field" behavior of subthreshold doses of reserpine and chlorpromazine in rats with lowered brain catecholamine or 5-hydroxytryptamine levels. The effects of antipsychotic agents on ambulation and rearing responses were enhanced in Ss with 65% lowered brain catecholamine. Lowering of the 5-hydroxytryptamine to 90% did not modify the effects of the antipsychotic agents. Brain catecholamine levels play a greater role in the mechanism of antipsychotic agents as compared to 5-hydroxytryptamine levels. (18 ref.)—*Journal abstract.*

3706. Bättig, K. (Swiss Federal Inst. of Technology, Zurich) **The effect of pre- and post-trial application of nicotine on the 12 problems of the Hebb-Williams-test in the rat.** *Psychopharmacologia*, 1970, Vol. 18(1), 68-76.—Pre- and posttrial application of .15 mg/kg nicotine had similar effects on the Hebb-Williams test performance of rats. The performance of both treated groups was better than that of the control group, suggesting a beneficial effect of nicotine on higher integrative functions.—*P. Federman.*

3707. Beketov, A. I. & Skoromnyi, N. A. (Crimean Medical Inst., Simferopol, USSR) **Vliyanie ganglioblokatorov i nitrosoedinenii na legochnoe krovoobrashchenie i oksigenatsiyu krovi.** [Influence of ganglioblockers and nitrocompounds on pulmonary circulation and blood oxygenation.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 57-60.—Ss were 58 dogs under sodium etaminal (pentobarbital) narcosis and stabilized artificial respiration. Under constant controlled respiration, gangliron, pachycarpine, and hexonium (hexamethonium) lowered pulmonary arterial pressure along with tonus of the pulmonary vessels and, after a brief increase, diminished the pulmonary flow and raised the saturation of the blood with O_2 . Nitroglycerine and sodium nitrite exerted a hypotensive action on pulmonary circulation, while nitropenton (metamine) exerted a hypertensive action thereon. The former also diminished pulmonary blood flow and lowered oxygenation of the arterial blood. No correlations were observed between changes in the hemodynamics of the pulmonary and systemic circulatory systems as a result of applying gangliolytics and nitrocompounds.—*J. D. London.*

3708. Blum, Kenneth. (Southwest Foundation for Research & Education, San Antonio, Tex.) **Effects of chlordiazepoxide and pentobarbital on conflict behavior in rats.** *Psychopharmacologia*, 1970, Vol. 17(5), 391-398.—A punishment discrimination (conflict) was conditioned in rats by simultaneously rewarding with food and punishing with shock all lever responses made in the presence of an auditory stimulus. Chlordiazepoxide and pentobarbital were administered in order to compare degree of attenuation of conflict behavior

relative to the production of behavioral debilitation. Chlordiazepoxide produced the maximum attenuation at doses that produced only minimum debilitation. Conflict attenuation (antianxiety) was greater under chlordiazepoxide while general debilitation (behavioral toxicity) was greater for pentobarbital. (17 ref.)—*Journal abstract.*

3709. Carlini, E. A. & Santos, M. (Faculdade de Ciências Médicas da Santa Casa, São Paulo, Brazil) **Structure activity relationship of four tetrahydrocannabinols and the pharmacological activity of five semi-purified extracts of Cannabis sativa.** *Psychopharmacologia*, 1970, Vol. 18(1), 82-93.—Studied the structure activity relationships of 4 tetrahydrocannabinols and the pharmacological activity of 5 semi-purified extracts from Cannabis sativa using 4 biological methods: corneal areflexia in rabbits (Gayer test) and cataonia decrease of motor activity and suppression of isolation-induced aggressiveness in mice. Modifications in the structure of pure, natural tetrahydrocannabinols rendered the resultant compounds inactive only when activity was measured by the Gayer test; the activity ranged from 1/5 to equal to the activity of the pure tetrahydrocannabinols by the other 3 methods.—*P. Federman.*

3710. Cole, Sherwood O. (Rutgers State U., Camden, N.J.) **Experimental effects of amphetamine: Supplementary report. Perceptual & Motor Skills**, 1970(Aug), Vol. 31(1), 223-232.—Evaluates generalizations related to the experimental effects of amphetamine on food-motivated operant behavior, bodily activity, and avoidance conditioning in terms of recent evidence. Acceptance of generalizations related to the drug's action on such behaviors requires that one also accept numerous qualifications or limitations in terms of drug-dose factors, S variables, and task characteristics. However, the desirability of such generalizations is stressed. (64 ref.)—*Journal abstract.*

3711. Cole, Sherwood O. (Rutgers State U.) **The relationship of amphetamine-induced anorexia and freezing under a multiple CRF-EXT operant schedule.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 163-168.—.5 and 1 mg/kg doses of amphetamine administered to 12 male albino rats significantly depressed operant performance maintained by a multiple CRF-extinction schedule and produced a significant amount of concomitant freezing behavior on 5 successive sessions. Since the correlation between depressed operant rate and freezing was significant on 3 of the 5 trials, the anorexic action of the drug may have been exaggerated by the incompatible-response nature of freezing. These results are discussed in terms of the ordered and nonordered action of the drug.—*Author abstract.*

3712. Crammer, J. L. & Rolfe, Brenda. (St. John's Hosp., Aylesbury, England) **Metabolism of ^{14}C -imipramine: III. Conversions by rat tissues.** *Psychopharmacologia*, 1970, Vol. 18(1), 26-37.—When the brains of Wistar rats were extracted 1 1/4 hr. after single ip injections of radioactive imipramine some desmethyl-imipramine was found, together with comparable amounts of iminodibenzyl and 2-hydroxyimipramine. The total radioactivity recorded from the brains did not rise on repeated daily injections. Brain slices incubated for 2 hr. at 37° C with radioactive imipramine produced desmethylimipramine, iminodibenzyl, and some didesmethylimipramine, but no hydroxylated metabolites. Liver slices produced more desmethylimipramine. less

iminodibenzyl, some 10-hydroxyimipramine and comparable 2-hydroxyimipramine. Heart, kidney, lung, and gut slices were also active in varying degrees. (22 ref.)—*P. Federman.*

3713. Dahlöf, Lars G., van Dis, Huib, & Larsson, Knut. (U. Göteborg, Sweden) **A simple device for inhalational anesthesia in restrained rats.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1211-1212.—Describes a method for administration of gaseous anesthetics to restrained rats. The device was developed especially for studying the influence of ether and halothane on genital responses elicited by electrical ICS, and consists of 2 silver tubings, 1 for administration of the anesthetic agent and the other for aspiration of profuse saliva. Drawings providing data for the construction of this device are included.—*Journal abstract.*

3714. Denber, Herman C. & Teller, David N. (Manhattan State Hosp., Ward's Island, N.Y.) **Studies on mescaline XVIII: Effect of phenothiazines, amphetamine and amobarbital sodium on uptake into brain and viscera.** *Agressologie*, 1968, Vol. 9(1), 127-136.—Injected pairs of white female Sherman rats with mescaline 8-¹⁴C iv 30 min. after intramuscular human equivalent doses of chlorpromazine, thiopropazine, diethazine, amobarbital, and amphetamine. Ss were killed 30 min. after the mescaline injection, and lung, liver, kidney, blood, and brain ¹⁴C content was measured. Subcellular fractions were prepared from the cortical brain regions. In Exp. II, groups of 4 Ss received 2.5-40 mg/kg mescaline ip 30 min. after the intramuscular drugs or saline (control). In controls, brain ¹⁴C mescaline was .14% of a 10-20 mg/kg iv dose after 30 min. with highest concentration in the cortical region. After 120 min., the concentration decreased to .017%. Diethazine increased the cortical uptake of iv mescaline 200% and amphetamine decreased uptake by 80%. Chlorpromazine and thiopropazine slightly decreased uptake into the brain homogenate. None of the drugs affected loose adsorption of mescaline to myelin. Amobarbital increased mitochondrial mescaline 300%. Pretreatment with chlorpromazine, thiopropazine, or amobarbital increased nerve ending mescaline content, though diethazine did not have this effect. Chlorpromazine and thiopropazine block mescaline activity while diethazine and amphetamine enhance behavioral changes due to the psychotomimetic. Diethazine, which intensifies mescaline's effects in rats and humans increases the psychotomimetic level in the brain, in contrast to amphetamine. It is suggested that neuroleptics do not necessarily act by altering uptake. (15 ref.)—*M. Daniels.*

3715. Dhawan, K. N., Jaju, B. P., & Gupta, G. P. (Lucknow U., K. G. Medical Coll., India) **Validity of antagonism of different effects of reserpine as test for anti-depressant activity.** *Psychopharmacologia*, 1970, Vol. 18(1), 94-98.—Studied the adynamic, ptotic, hypothermic, and conditioned avoidance response blocking effects of reserpine in normal rats and in rats subjected to electroconvulsions for 5 days. Prior exposure to electroconvulsions blocked only the hypothermic response of reserpine.—*P. Federman.*

3717. Gano, Yu., Bugaškiĭ, Ya., Anichkov, S. V., & Zabrodin, O. N. (Inst. of Experimental Medicine,

Leningrad, USSR) **Vliyanie tsentral'nykh neĭotropnykh sredstv na razvitiye eksperimental'nykh neirogennykh distrofiĭ stenki zheludka u krys.** [Influence of central neurotropic agents on the development of experimental neurogenic dystrophies of the gastric wall in rats.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 66-69.—Gastric ulcers were produced in white rats either by immobilization for 24 hr. or by combined immobilization and electrization for 3 hr. Agents administered 2-3 hr. after the start of 24 hr. immobilization were aminazine (chlorpromazine), hexobarbital, amizyl (benactyzine), sodium gamma-hydroxybutyrate, and ipronal (5-allylo-5-beta-hydroxypropylobarbituric acid), which is free of sleep-inducing action, but possesses marked sedative properties. Agents administered 15 min. before combined immobilization and electrization except for imipramine, administered 1 hr. before electrization were aminazine, phenobarbital, amizyl, and phenamine. In both instances, central depressive neurotropic agents noticeably forestalled the development of experimental ulcers of the stomach. On the contrary, phenamine increased the number of ulcerations. Analysis of the mechanism underlying the development of experimental gastric dystrophies produces evidence for the neurogenic nature of their development, and the great involvement of the sympathetic nervous system in the process. At the same time, the evidence points to a certain role for the peptic factor therein.—*I. D. London.*

3718. Gargasas, L., Grinyavichyus, K., Milyauskas, R., & Mitskene, V. (Medical Inst., Kaunas, USSR) **Odnomernye raspredeleniya EKOg vo vremya tiopentalovogo narkoza.** [Unidimensional distributions of the ECoG during thiopental narcosis.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 142-145.—In view of the fact that the form of the electrocorticogram (ECoG) in the case of delta activity reflects quite well the probability density of unidimensional distributions of ECoG potentials, and certain stages of narcosis are accompanied by delta activity, a study was undertaken of the correlation obtaining between depth of thiopental narcosis and the forms of unidimensional distributions of potentials. Curarized rabbits were used as Ss in acute experiments to obtain visual ECoG tracings along with 3 freely moving rabbits in chronic experiments (in the case of the latter, EMGs of the occipital muscles and pneumograms were taken, along with measurements of pupillary diameter, eyelid and corneal reflexes, and motor activity). 341 histograms were studied. Upon coming out of deep narcosis, the probability density of unidimensional distributions of visual ECoG potentials successively underwent a change in form from positively asymmetrical to symmetrical (mostly bimodal) and, further on, to negatively asymmetrical. A complete correspondence is noted between the form of probability density and depth of narcosis.—*I. D. London.*

3719. Glick, Stanley D., Levin, Bruce, & Jarvik, M. E. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Role of monkeys' spatial preferences in performance of a nonspatial task.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 56-61.—Analyzed the performance of adult rhesus monkeys in 3 experiments on a nonspatial delayed matching task in terms of spatial and color preferences and perseverations. Ss utilized significant spatial but not color tendencies. The strength of spatial tendencies was determined to be an important error factor accounting for differences among Ss in overall accuracy. Spatial tendencies, however, could not

account for intra-S differences in accuracy as a function of testing conditions. Administration of d-amphetamine, scopolamine, and chlorpromazine lowered accuracy. Only the effect of d-amphetamine, however, could be largely attributed to an influence on spatial tendencies. The elicitation of spatial tendencies was found to be related to the immediacy with which Ss performed the matching response.—*Journal abstract.*

3720. **Goldberg, Steven R. & Schuster, Charles R.** (U. Michigan, Medical School) **Nalorphine: Increased sensitivity of monkeys formerly dependent on morphine.** *Science*, 1969(Dec), Vol. 166(3912), 1548-1549.—3 rhesus monkeys, formerly dependent on morphine, had increased sensitivity to nalorphine's effect of suppressing operant responding for food, as compared with 2 Ss with no history of morphine exposure. Within the dose range employed, nalorphine injections produced emesis, salivation, and hyperirritability in formerly morphine-dependent Ss but not in controls.—*Journal abstract.*

A.** (Medical Inst., Kursk, USSR) **K analizu batmotropnogo éffekta diprazina i dimedrola.** [A contribution to the analysis of the bathmotropic effect of diprazine and dimedrol.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 35-37.—Frog hearts in situ were used to study the influence of diprazine (promethazine) and dimedrol (benedryl) on the excitability of the myocardium. In doses of 5 and 10 mg/kg they displayed a marked negative action without affecting the amplitude of cardiac contractions. In a dose of 25 mg/kg they raised the excitability of the myocardium to the accompaniment of a negative inotropic effect. The bathmotropic action of dimedrol was mediated through both the adreno- and cholinergic innervation of the heart and their influence on the neuromuscular structures of the myocardium itself.—*I. D. London.*

3722. **Heise, George A. & Lilie, Nellie L.** (Indiana U.) **Effects of scopolamine, atropine, and d-amphetamine on internal and external control of responding on non-reinforced trials.** *Psychopharmacologia*, 1970, Vol. 18(1), 38-49.—Rats learned not to respond on nonreinforced trials in a discrete trial situation in which trial responses were reinforced only if preceded by 3 more nonresponse trials. Scopolamine impaired performance to about the same extent under the internal and external control conditions; d-amphetamine impaired nonresponding on trials only under internal control conditions. Atropine affected both internally and externally controlled nonresponding but had a greater effect on internally controlled nonresponding.—*P. Federman.*

3723. **Idänpään-Heikkilä, Juhana E., et al.** (U. Helsinki, Finland) **Relation of pharmacological and behavioral effects of a hallucinogenic amphetamine to distribution in cat brain.** *Science*, 1969(May), Vol. 164(3883), 1085-1087.—The hallucinogen 2,5-dimethoxy-4-methylamphetamine, also known as STP, accumulates in specific areas of cat brains. In an experiment with 6 cats, the unchanged compound was detected in the brain for at least 6 hr., whereas its behavioral effects lasted for about 4 hr. The coincidental pharmacological and behavioral effects of the compound apparently indicate a relation between the anatomical distribution and action.—*Journal abstract.*

veshchestv na pamyat' i obuchenie. [Action of pharmacological agents on memory and learning.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 237-246.—Presents an analytic survey of the literature on the influence of pharmacological agents on the process of memory formation, and the degree to which learning is based on the process of transferring information from short- to long-term memory. The survey covers in detail: (a) "the action of pharmacological agents on the memory-mechanisms themselves (agents acting on the conduction and circulation of nerve impulses in neural circuits; agents acting on RNA and protein synthesis)"; and (b) "the action of pharmacological agents on the regulatory memory-mechanisms (the action of agents and the role of emotions in memory-formation; the action of agents and the role of the ascending reticular activating system)."—*I. D. London.*

3725. **Jackson, Donald E.** (Eastern Michigan U.) **Effects of 6-fluoro-N, N-diethyltryptamine (6-FDET) on selected rat behaviors.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 139-142.—6-FDET, a tryptamine derivative, produces the autonomic symptoms and mood changes characteristic of hallucinogens, but not perceptual and thinking disturbances. Several studies were run to assess its effect on certain rat behaviors with 11 male albino Sprague-Dawley rats. It was found that 6-FDET exerts a fast-acting, relatively short-lived inhibitory effect on drinking and water-motivated behaviors. No evidence was found to indicate that 6-FDET affects acquisition of conditioned suppression.—*Journal abstract.*

3726. **Johnson, F. N.** (U. Birmingham, Medical School, England) **The effects of chlorpromazine on one-trial passive avoidance learning in mice: Further examination of pre- and post-learning administration.** *Psychopharmacologia*, 1970, Vol. 18(1), 11-18.—Chlorpromazine was administered to mice .5, 2 or 10 min. after a 1-trial passive avoidance learning experience. The drug produced effects of the magnitude and rate of extinction of the learned response dependent upon the injection time. In Exp. II in which lower dosages were used, the drug had no effect when given 240 min. before learning, but produced maximal blocking of response acquisition when given 120 and 8 min. before learning. Drug injections 6 and 3 min. before learning had actions on postlearning memory traces. Chlorpromazine had no effect when given 20 min. after learning.—*P. Federman.*

3727. **Jonason, Kim R., et al.** (Ohio State U.) **Effects of amphetamine upon relearning pattern and black-white discriminations following neocortical lesions in rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 47-55.—Subjected 33 male hooded Long-Evans rats previously trained to perform either a pattern or a black-white discrimination to either bilateral anterior or bilateral posterior neocortical lesions, and then retrained on the task while being treated with 1 mg/kg dl-amphetamine sulfate. Amphetamine did not reinstate visual contour perception in Ss with posterior ablations, nor did it have any consequence, postoperatively, upon learning or relearning the black-white discrimination for Ss with anterior neocortical lesions. When a comparison was made between a large group of amphetamine-treated Ss with posterior ablations and a large group of posteriorly decorticated control Ss, a small, but consistent tendency toward improved performance was found in the am-

phetamine-injected Ss. It is also noted that normal learning scores did not predict either anterior or posterior postoperative retention of the black-white discrimination.—*Journal abstract.*

(Inst. of Normal & Pathological Physiology, Moscow, USSR) **Deistvie valluma (diazepam) na sudorozhnyi sindrom pri stolbnyake.** [Action of valium (diazepam) on the convulsive syndrome in tetanus.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 166-169.—Valium possessed marked myorelaxant action in white rats. In the region of the spinal cord it depressed the activity of (a) the internuncial neurons included in the efferent output system (diminution of electrical activity of muscles in local tetanus), and (b) the internuncial neurons ensuring generalization of excitation along the spinal cord.—*I. D. London.*

3736. Kulagin, V. P. (Inst. of Cardiology, Moscow, USSR) **Izmenenie reaktivnosti sosudov pod vliyaniem al'dometa i benzanidina.** [Change in vascular reactivity under the influence of aldomet and benzanidine.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 188-190.—Studied the effect of aldomet and benzanidine (esbatal) on the character of the vasomotor reactions in the hind leg of narcotized cats subjected to nervous influences differing in intensity. Iv injection of 60-80 mg/kg of aldomet or benzanidine into Ss under ether-urethane narcosis changed the character of the vasomotor reactions of the hind legs to electrical stimulation of the lumbar region of the sympathetic chain. This was attended by either a weakening or a replacement of vasoconstrictive effects by vasodilational effects. Benzanidine brought about a change in reaction to both weak and strong stimulation. Aldomet led to the replacement of vasoconstriction by vasodilatation in response to weak stimulation.—*I. D. London.*

3737. Kuzina, N. V. (Medical Stomatological Inst., Moscow, USSR) **O svyazi mezhdu antikrazolovymi i**

antiamidopirinovym deistviem malykh trankvillizatorov. [On the connection between the anticorazol and anti-amidopyrine action of minor tranquilizers.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 159-163.—White rats and mice were used in a study of the pain-alleviating influence of duxen alone and of its combinations with amidopyrine (aminopyridine) on pain sensitivity (electrical stimulation of the tail), and the CNS. It was shown that elements of both antagonism and synergism are present in the interaction between minor tranquilizers and amidopyrine. The antagonism was observed particularly in minor tranquilizers which displayed anticorazol (antipentylene-tetrazol) action: duxen and meprobamate. Trioxazine and oxyldine, which raised the convulsant activity of corazol, acted in the same way with respect to amidopyrine, remaining synergists of the latter according to a number of other tests. Duxen considerably raised sensitivity to pain. Amidopyrine had little effect on the pain-alleviating action of duxen. Amidopyrine did not potentiate the action of duxen on defensive CRs. Duxen considerably reduced the toxicity and convulsive action of amidopyrine and acted analogously on the convulsive action of corazol.—*I. D. London.*

3738. Laborit, H., Laborit, G., & Baron, C. (Hosp. Boucicaut, CEPBEPE, Lab. d'Eutonologie, Paris, France) *Etude comparative de l'action de la chlorpromazine et de l'Ag 246 sur l'électrogénèse corticale et sous-corticale.* [Comparative study of the action of chlorpromazine and AG 246 on cortical and subcortical electrogenesis.] *Agressologie*, 1968, Vol. 9(1), 137-151.—Presents a comparative study in the rabbit with Monnier's stereotaxic apparatus of the respective action of chlorpromazine and morpholinoethyl-2, methyl-4, phenyl-6, pyridazone-3 (Ag 246). This molecule is characterized by a strong analgesic action without any ventilatory depression or loss of consciousness. On the median center, chlorpromazine lowered the threshold of recruitment and heightened that of desynchronization by stimulation at average frequencies. Ag 246 had no action at all. On the hippocampus, chlorpromazine prolonged duration of afterdischarges, while Ag 246 suppressed them completely. On the mesencephalic reticular formation, direct stimulation caused cortical arousal which was little influenced by chlorpromazine or Ag 246. Stimulation of the sciatica caused immediate cortical desynchronization which was suppressed by Ag 246 and prolonged after the interruption of the stimulation suppressed by chlorpromazine. An attempt is made to interpret the biological method of action of the 2 drugs and to define their site of action on the neuroglia and neurons.—*English abstract.*

3739. Lapik, A. S., Gubenko, I. S., Korochkin, L. I., & Salganik, R. I. (Inst. of Cytology & Genetics, Novosibirsk, USSR) *Farmakologicheskaya aktivnost' i toksichnost' nucleaz.* [Pharmacological activity and toxicity of the nucleases.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 210-212.—Includes data on toxicity and determinations of the action of DNA-ase and RNA-ase on several physiological functions in mice and rats. These enzymes had no effect on arterial pressure, respiration, and smooth muscle tonus. Signs of toxic influence on the CNS appeared only on direct administration of large doses of the enzymes (100 mg/kg) into the brain.—*I. D. London.*

3740. Lapin, I. P., Ksenofontova, T. A., Kvitko, I. Ya., & Porai-Koshits, B. A. (Lensovet Technological Inst.,

Leningrad, USSR) *Tsentral'naya neïrotropnaya aktivnost' aminopropil'nykh i aminopropionil'nykh proizvodnykh iminodibenzila i difenilamina i svyaz ee konstantami ionizatsii.* [Central neurotropic activity of aminopropyl and aminopropionyl derivatives of iminodibenzyl and diphenylamine and its connection with ionization constants.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 8-13.—More than 1000 mice were used in a study of the relationship between the different pharmacological effects of several derivatives of iminodibenzyl and diphenylamine and the values of their ionization constants (pKa). Among the aminopropionyl derivatives of iminodibenzyl, decrease in pKa was accompanied by a weakening or even the disappearance of the pharmacological (antireserpine, adrenergic, cholinolytic) effects typical for antidepressants. It is possible that a value of pKa somewhat higher than 8.3 is necessary for these effects in aminopropionyl derivatives of iminodibenzyl.—*I. D. London.*

3741. Lin, Robert C., Ngai, S. H., & Costa, E. (Columbia U., Coll. of Physicians & Surgeons) *Lysergic acid diethylamide: Role in conversion of plasma tryptophan to brain serotonin (5-hydroxytryptamine).* *Science*, 1969(Oct), Vol. 166(3902), 237-239.—Reports that injections of LSD decrease the turnover rate of 5-hydroxytryptamine (HT) of rat brain, as measured from the conversion of ¹⁴C-tryptophan into ¹⁴C-HT. The 2-bromolysergic acid diethylamide given in doses 5 times greater than those of LSD failed to change the rate of ¹⁴C-tryptophan conversion into ¹⁴C-HT. The effect of LSD is discussed with regard to its action on brain serotonergic neurons and its psychotomimetic effects. (16 ref.)—*Journal abstract.*

3742. Linich, E. P. (Inst. of Experimental Medicine, Leningrad, USSR) *Vliyaniye nekotorykh adrenergicheskikh preparatov na razvitiye éksperimental'nykh neïrodistrofii v stenke zheludka krysa.* [Influence of several adrenergic preparations on the development of experimental neurodystrophies in the gastric wall in rats.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 69-71.—Neurogenic reflex dystrophies were produced in white rats by applying "extreme" stimulation: electrization of immobilized Ss or mechanical traumatization of the duodenum. Agents administered 15 min. before application of extreme stimulation were 4 mg/kg phenamine, 5 mg/kg noradrenaline, 25 mg/kg phepracet (beta-phenylisopropylamide of paraaminophenylacetic acid) and its derivatives: beta-phenylisopropylamide of paradiethylaminophenylacetic acid (30 mg/kg) and beta-phenylisopropylamide of paradimethylaminophenylacetic acid (25 mg/kg); agents administered 1 hr. before application of extreme stimulation were 2.5 mg/kg isadrine and 2 mg/kg ephedrine. Also investigated was the ability of single administration of noradrenaline (1-2 mg/lg) and isadrine (10-25 mg/kg) to disrupt the trophic processes in intact Ss. Large doses of noradrenaline and isadrine led to development of destructive lesions in the gastric mucosa. Prior administration of noradrenaline, isadrine, ephedrine, and phenamine intensified the development of neurogenic dystrophies, caused by extreme stimulation. Sympatholytic agents (phenamine derivatives) hindered the development of destructive lesions of the gastric wall following extreme stimulation. The data provide evidence for the participation of the sympathetic nervous system in the development of neurogenic dystrophies of the gastric wall. Sympathomimetic agents themselves

produced destructive changes in the gastric mucosa. Sympatholytic agents, which blocked both alpha- and beta-adrenoreactive systems, hindered the development of the dystrophic process.—*I. D. London.*

3743. Lubas, A. A., Stankavichyus, A. P., & Shadurskii, K. S. (Medical Inst., Kaunas, USSR) Toksikologicheskie i antiserotoninovyie svoistva nekotorykh proizvodnykh guanidina. [Toxicological and antiserotonin properties of several derivatives of guanidine.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 17-21. White mice were used to study the antiserotonin properties of 11 guanidine derivatives, several of which display marked hypotensive action. Compounds with 2 or 3 benzyl radicals were shown to display marked antiserotonin properties.—*I. D. London.*

3744. Lukienko, P. I. (Medical Inst., Grodensk, USSR) Vliyaniye apressina na potrebleniye kisloroda, tkanevye dykhanie i aktivnost' nekotorykh oksidoreduktaz u intaktnykh i gipoksicheskikh krya. [Influence of apressin on oxygen consumption, tissue respiration and the activity of several oxidoreductases in intact and hypoxic rats.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 196-199.—Studied the influence of apressin in 112 Ss (intact and under conditions of hypoxia in a bathchamber simulating a height of 10,000 m. for 180 min.). Apressin decreased the total consumption and rate of utilization of O₂ in the brain and muscles of intact Ss, and promoted a more rapid restoration of its assimilation in posthypoxia. Apressin lowered cerebral, hepatic, and cardiac succinate-dehydrogenase activity in intact and hypoxic Ss, and decreased the inhibiting action of hypoxia on cytochrome oxidase activity.—*I. D. London.*

3745. Mandell, A. J., et al. (U. California, Los Angeles) Neurochemical correlates of the imipramine antagonism of the behavioral effects of norepinephrine. *Life Sciences*, 1968(Dec), Vol. 7(23, Pt. 1), 1317-1324. Determined the radioactivity of whole brain norepinephrine (NE), normetanephrine (NME), and vanillylmandelic acid 2 min following the iv injection of C¹⁴N1 during Phase III of the action of imipramine and in saline pretreated controls. The imipramine treated animals had significantly less C¹⁴NME at a time when the behaviorally depressing effects of NE were antagonized. It is speculated that imipramine has an antidepressant action by blocking the access of behaviorally depressing NE to postsynaptic sites. This mechanism has been previously postulated for the action of the phenothiazines. Recent reports indicate that certain subgroups of clinical depressions are phenothiazine responsive. It is acknowledged that imipramine induced alterations in the mobility of NE through many cellular and intracellular membranes may be involved. (23 ref.)—*Journal summary.*

3746. Menner, John H., & Rudrik, Allan D. (Dow Human Health Research Lab, Zionsville, Ind.) The effect of pronethalol on the anticonvulsant action of acetazolamide. *Life Sciences*, 1968(Dec), Vol. 7 (23, Pt. 1), 1265-1269. Studied the effects of pronethalol on electrically induced convulsive seizures and on the anticonvulsant effect of acetazolamide in male albino mice. Pronethalol possesses anticonvulsant activity which is rapid in onset and of short duration. The effect of pronethalol on the anticonvulsant effect of acetazolamide is biphasic with potentiation being observed when short pretreatments are employed and antagonism when longer intervals are used.—*Journal summary.*

3747. Merlo, Alicia B., & Kuzniecki, Nelida. (U. Buenos Aires, Faculty of Pharmacology & Biochemistry, Argentina) Effect of imipramine and chlorimipramine on an acute instrumental trace conditioned reflex in rats. *Psychopharmacologia*, 1970, Vol. 18(1), 124-128.—An acute conditioned trace reflex was established in rats using a buzzer as a CS, and an electric shock as an absolute stimulus. The intervals between the end of CS initiation of absolute stimulus were 0, 2, and 10 sec. for the different control groups and for those treated with imipramine and chlorimipramine. The number of CRs was significantly lower in the 0 trace control group than in the control groups trained with longer intervals. Both drugs decreased the number of CRs, demonstrating that acquisition and the influence of the interval upon it were annulled.—*P. Federman.*

3748. Mitskine, V., Milyauskas, R., & Mitskis, A. (Medical Inst., Kaunas, USSR) Srednyaya chastota ekstremumov i srednyaya amplituda elektrokortikogrammy v dinamike tiopentalovogo narkoza. [Mean frequency of the extrema and mean amplitude of the electrocorticogram in the dynamics of thiopental narcosis.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 3-7.—6 freely moving rabbits with implanted electrodes under 20-30 mg/kg thiopental narcosis were Ss in the study, followed by a comparative study under curarization. Concurrently, recordings were made of pupillary diameter, eyelid and corneal reflexes, and rate of respiration along with EMGs of the occipital muscles and observations of general movements. In both acute and chronic experiments the changes in mean frequency of the extrema were analogous: the deeper the narcosis, the less this mean frequency. The given parameter, mean electrocorticogram (ECoG) amplitude, can be utilized to define the depth of the narcosis. Mean ECoG amplitude in acute experiments was greater than in chronic, although the character of the changes under the action of thiopental remained the same. The application of curariform preparations produced practically no changes in the dynamics of the average frequency of the extrema in narcosis. The increase in ECoG amplitude was evidently connected with their synchronizing action on the ECoG as a result of the exclusion of proprioceptive impulses.—*I. D. London.*

3749. Mustafina, T. K. (Inst. of Experimental Medicine, Leningrad, USSR) Antigistaminnyie svoistva nekotorykh kholinoliticheskikh sredstv. [Antihistamine properties of several cholinolytic agents.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 28-31.—Fistulated dogs and isolated intestinal segments of guinea pigs were used. The cholinolytics, benactyzine (amizyl) and amedine, possess marked antihistamine action. The antagonism of these agents to histamine involved a blockade of the receptors which was "nonspecific" and "competitive" in kind, judging from the "dose-response" curve.—*I. D. London.*

3750. Navarro, German. (U. California, San Francisco) Effects of narcotics on the electrical activity of the brain. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 313.

3751. Nikiforov, M. I., Azhubalis, V. A., & Beneralov, V. I. (Kirov Military-Medical Academy, Leningrad, USSR) Vliyaniye gamofena na bioelektricheskuyu aktivnost' golovnogo mozga. [Influence of gamophen on cerebral bioelectrical activity.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 146-149.—20 rabbits were studied to determine the bioelectrical activity of several sections of the brain under the influence of

gamophen (beta-phenylisopropylamide of gamma-aminobutyric acid). With respect to effect on cerebral bioelectrical activity, 5 mg/kg of gamophen was close to the threshold value. With iv administration of 1-10 mg/kg, successive alternation of periods of fast beta and gamma oscillations and high-amplitude alpha activity and spindles was observed in the EEG. Administration of 15-75 mg/kg was accompanied by activation of primarily beta and gamma rhythms. The application of gamophen against the background of amine intoxication (0.5-2 mg/kg) and during the phase of "exhaustion" of cerebral bioelectrical activity restored fusiform activity and brought about a stable increase in the amplitude of the beta and gamma waves. Following neuroanatomical isolation of the hemispheres of the terminal brain, both the low- and middle-frequency rhythms (1-13 cps) and the fusiform rhythms fell away completely against the background of gamophen action. Extirpation of the medial section of the thalamus was accompanied by a decrease in biopotential amplitude in the homolateral hemisphere before and after gamophen administration. Subarachnoid administration of 50-100 microgm. brought about the appearance of high-amplitude synchronized potentials in the electrocorticogram (EEG). If, following iv injection, intensification of primarily high-frequency bioelectrical activity was observed, then subarachnoid administration was accompanied by changes in the EEG, characteristic for the slow-wave phase of physiological and drug-induced sleep.—*I. D. London.*

3752. Ostrovskaya, R. U., Artemenko, G. N., & Raevskii, K. S. (Inst. of Pharmacology, Moscow, USSR) *O neurotropnykh svoistvakh aminooksluksuono i gamma-aminookslimaslyano i kislot.* [On the neurotropic properties of aminooxyacetic acid and gamma-aminooxybutyric acid.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 137-142.—White mice, in experimental groups of 8-10, were used to investigate the neurotropic activity of the agents by assessing (a) their influence on the narcotic effect of Na-thiopental, medinal (barbital), and Na-oxybutyrate; and (b) their anticonvulsive action, i.e., their influence on the convulsive effects of corazol (pentylene-tetrazol), strychnine, nicotine, and semicarbazide. The influence of aminooxyacetic acid (AOAA) and gamma-aminooxybutyric acid (GAOBA) on the EEG was investigated in chronic experiments on 11 rabbits with implanted electrodes. AOAA and GAOBA possess similar spectra of neurotropic activity. They potentiated the narcotic effect of Na-thiopental, medinal, and Na-oxybutyrate; the potentiating mechanism involving both direct and indirect components. The aminooxy-acids under study displayed a synchronizing influence and potentiated the effects of gamma-aminobutyric acid (GABA) with respect to the EEG. They exerted a defensive effect in convulsions, brought on by semicarbazide and due to a decrease in cerebral GABA level. It is suggested that an increase in cerebral GABA level plays a role in the origin of the neurotropic effects of the aminooxy-acids under study.—*I. D. London.*

3753. Panksepp, Jaak; Gandelman, Ronald, & Trowell, Jay. (U. Sussex, Lab. of Experimental Psychology, Brighton, England) *Modulation of hypothalamic self-stimulation and escape behavior by chlordiazepoxide.* *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 965-969.—16 out of 17 Charles River albino rats with lateral hypothalamic electrodes self-stimulated at higher rates at

threshold current intensities while under chlordiazepoxide (CDP) than under no-drug conditions. The remaining 5 exhibited strong escape but no approach tendencies to the stimulation. At current levels 10-15 μ A above threshold, CDP (15 mg/kg) increased rate of self-stimulation at sites where escape behavior was also obtained, but decreased rate at sites where continuous stimulation did not elicit consistent escape. Since CDP also increases the latency of escape behavior from hypothalamic sites where both self-stimulation and escape is obtained, it is suggested that CDP modulates the activity of a negative rather than a positive neural system.—*Journal abstract.*

3754. Parolia, D. I. (Pavlov Inst. of Physiology, Leningrad, USSR) *Vliyaniye ionov kaliya na tonus sosudov mozga.* [Influence of K-ions on cerebrovascular tonus.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1242-1248.—11 etheranized cats were Ss in the study which also investigated the correlation between initial vascular tonus and the value and character of the cerebrovascular reactions elicited by KCl. The introduction of KCl (5 ml. of 5-10.5% solution) into the perfusing fluid was accompanied by a decrease in cerebrovascular tonus. A considerably higher concentration of KCl produced a biphasic reaction: initial constriction and subsequent dilatation. The dilatational effect lends some support to the view that this cation is 1 of the auxiliary factors involved in the mechanism underlying hyperemia of the functionally active parts of the brain. There was a reliable correlation between the degree of decrease in cerebrovascular tonus brought about by papaverine and the ensuing decrease in magnitude of the constrictive and dilatational phases of reactions to the administration of KCl (22 ref.).—*I. D. London.*

3755. Petukhov, V. I. (Hygiene-Medical Inst., Leningrad, USSR) *Vliyaniye kholinolitkov na techenie travmaticheskogo shoka.* [Influence of cholinolytics on the course of traumatic shock.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 170-171.—Rabbits were used to study the capacity of M- and N-cholinolytics to influence the course of traumatic shock, produced by hammering on the soft tissues of the thigh. The central cholinolytics, amizyl (benactyzine) and atropinal administered after primary injury, increased the resistance of the Ss to subsequent severe injury. The protective action in traumatic shock was most marked with the application of the central M-cholinolytic amizyl, and was absent in the central N-cholinolytic, pipidphen, and the peripheral M-cholinolytic, methamizyl iodomethylate.—*I. D. London.*

3756. Pryanishnikova, N. T. (Inst. of Pharmacology & Chemotherapy, Moscow, USSR) *Vliyaniye anestesiziruyushchikh veshchestv na monomolekulyarnye sloi lipidov nervnoi tkani.* [Influence of anesthetizing agents on the lipid monomolecular layers of nerve tissue.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 178-182.—Rabbits and frogs were used to study the connection between the pharmacological action of 12 anesthetics and their influence on the lipid monomolecular layers of rabbit and frog nerve tissue. It was shown that anesthetics penetrated into the lipid monomolecular layers of nerve tissue and thickened them. Minimal effective concentrations of anesthetics, producing an increase in pressure in the monolayer, were equivalent to concentrations of anesthetics in the monolayer. There was a direct interconnection between

the anesthetizing activity of drugs and their capacity to penetrate into the lipid monolayer of the nerve tissue.—*I. D. London.*

3757. Russek, Mauricio. (National Polytechnical Inst., National School of Biological Sciences, Mexico City, Mexico) **Demonstration of the influence of an hepatic glucosensitive mechanism on food-intake.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1207-1209.—The intraportal injection of 3-12 gm. of glucose through a chronic cannula produced a 40-75 min. anorexia in 2 22-hr fasted dogs that would normally eat 500 gm. of dry food without interruption. The same amount of glucose injected into a jugular cannula did not elicit any anorexia. The intraportal injection of an equal volume of isosmotic NaCl did not produce any noticeable change in the feeding behavior of the same Ss. Therefore, the satiating effect was obtained only when the glucose went directly into the liver and not when distributed throughout the organism.—*Journal abstract.*

3758. Schneider, Allen M., Kapp, Bruce S., & Sherman, William M. (New York U.) **The effects of centrally and peripherally acting cholinergic drugs on the short-term performance gradient following passive-avoidance training.** *Psychopharmacologia*, 1970, Vol. 18(1), 77-81.—Rats, injected with several drugs or saline, were trained in a passive-avoidance platform procedure and tested 5, 15, and 120 sec. later. In the saline-treated groups step-down latencies increased between the 5- and 15-sec intervals and stabilized between the 15- and 120-sec intervals. The drugs had the following effects: physostigmine salicylate decreased test latencies at the 15- and 120-sec intervals, atropine sulfate and atropine methylate increased test latencies at the 5-sec interval, and neostigmine did not modify test latencies at any of the 3 intervals.—*P. Federman.*

(Agricultural Inst., Sverdlovsk, USSR) **Promerzhuotochnyi obmen sakhara i letuchikh zhirnykh kislot u ovets pri vyklyuchenii vegetativnoi innervatsii na urovne N-kholinoreaktivnykh sistem.** [Intermediate metabolism of sugar and volatile fatty acids in sheep with exclusion of autonomic innervation at the level of the N-cholinoreactive systems.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1288-1292.—Exclusion of the N-cholinoreactive systems with hexonium (hexamethonium) abolished the increase in sugar in arterial blood, arising in response to the action of alimentary stimulation, and led to a considerable decrease in its consumption by the digestive system. Despite feeding, the amount of volatile fatty acids entering the blood of the portal vein declined against a background of N-cholinolytic action instead of increasing as in normal cases. The decline of sugar secretion into the arterial blood, which occurred as a result of "physiological denervation," was abolished after the administration of adrenaline, and the digestive system increased consumption thereof. Against a background of N-cholinoreactive influence, adrenaline did not increase the resorption of volatile fatty acids from the gastrointestinal tract. (24 ref.)—*I. D. London.*

3764. Srimal, R. C. & Dhawan, B. N. (Central Drug Research Inst., Lucknow, India) **An analysis of methylphenidate induced gnawing in guinea pigs.** *Psychopharmacologia*, 1970, Vol. 18(1), 99-107.—Tested 20 compounds acting on the CNS and the autonomic nervous system in guinea pigs for their ability to induce gnawing. Only methylphenidate induced vigorous gnawing similar to that produced by apomorphine and amphetamine. Catecholamines do not appear to play any significant role in the mediation of methylphenidate gnawing, or even in the gnawing response itself.—*P. Federman.*

3765. Stein, Larry & Berger, Barry D. (Wyeth Lab., Philadelphia, Pa.) **Paradoxical fear-increasing effects of tranquilizers: Evidence of repression of memory in the rat.** *Science*, 1969(Oct), Vol. 166(3902), 253-256.—Reports that conditioned suppression of feeding, an index of fear, was increased rather than decreased in rats by the administration of benzodiazepine tranquilizers or amobarbital. The drug-induced increase in conditioned fear varied directly with the intensity of the shock used in fear conditioning. The drugs had no fear-increasing effect in unshocked controls or in Ss made amnesic by ECS given immediately after fear conditioning. Results recall clinical reports that iv amobarbital facilitates the recall of repressed traumatic experiences. The retrieval of painful memories may be inhibited or repressed in animals as well as in humans. In both cases, tranquilizers may counteract repression by disinhibition of the act of retrieval. (15 ref.)—*Journal abstract.*

3766. Stolk, Jon M. & Rech, Richard H. (Dartmouth Medical School) **Species differences in amphetamine toxicity: Effects of aggregation, acute and chronic reserpine pretreatment in mice and rats.** *Life Sciences*, 1968(Dec), Vol. 7(23, Pt. 1), 1299-1309.—Presents marked differences in amphetamine toxicity between rats and mice. Female albino Charles River mice and

Sprague-Dawley female rats were Ss. The major differences are as follows: (a) the effect of aggregation on amphetamine toxicity is not a factor in rats; (b) the protective effect of a single dose of reserpine was confirmed in grouped mice; rats show an increased susceptibility to some doses of amphetamine under these conditions; and (c) a dramatic increase in the lethality of amphetamine is produced in rats chronically treated with reserpine, which effect is equivocal in mice.—*Journal summary.*

3767. Strömberg, Ulf. (U. Göteborg, Sweden) **DOPA effects on motility in mice: Potentiation by MK 485 and dexchlorpheniramine.** *Psychopharmacologia*, 1970, Vol. 18(1), 58-67.—Mice were given L-dihydroxyphenylalanine (L-DOPA) in doses ranging from 7.8-500 mg/kg with and without previous administration of MK 485. Dexchlorpheniramine together with MK 485 was given before L-DOPA to some Ss. L-DOPA has depressant and excitatory effects on locomotor activity depending on dose, and MK 485 caused a potentiation of both these effects, together with an increased dopamine production in the brain. Dexchlorpheniramine caused a further potentiation of the effects on activity. The depressant effects on motility were concluded to be mediated centrally, and MK 485 potentiates L-DOPA effects on activity by allowing more of the DOPA injected to pass through the blood brain barrier and form dopamine intracerebrally. 3769. Val'dman, A. V. & Kozlovskaya, M. M. (Pavlov Medical Inst., Leningrad, USSR) **Dissotsialnaya somato-vegetativnykh proyavlenii' emotsional'nogo povedeniya pod vliyaniem aminazina.** [Dissociation of somato-autonomic manifestations of emotional behavior under the influence of aminazine.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1185-1195.—In rabbits with implanted electrodes emotional-behavioral reactions were evoked by local stimulation of the hypothalamus. Recordings from cortical fields and the deep structures of the brain were also made of the (a) EEG accompaniments of "pricking up the ears," and (b) cardiovascular and respiratory reactions arising on stimulation of the same structures of the hypothalamus. Aminazine (chlorpromazine) caused dissociation of the emotional, motor, and autonomic components of the aggressive-defensive reaction, evoked by stimulation of the mural nuclei of the III ventricle. When the ventrocaudal and dorsolateral regions of the hypothalamus were stimulated, the aminazine-induced dissociation was manifested over a smaller range of doses. In doses, which induced inhibition of the goal-directed character and emotional expressiveness of behavioral reactions, aminazine did not suppress the effector hypothalamo-mesencephalic systems, connected with producing the autonomic and motor components of these reactions. The blocking effect of aminazine was little manifested on the effector links of the hypothalamic periventricular system and was expressed in greater degree with respect to the effector systems of the ventrocaudal and to the dorsolateral hypothalamus—something which was due to the specific features of the intracranial connections of these zones. (English summary) (31 ref.)—*I. D. London.*

3770. Vedernikov, Yu. P. & Afrikanov, I. I. (Medical Inst., Sverdlov, USSR) **Znachenie katekholaminov**

dlya anal'geticheskogo deistviya morfina. [Significance of catecholamines for the analgesic action of morphine.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 154-159.—Female white rats were divided into 2 groups: "tolerant" and "intolerant" to a test dose of 5 mg/kg morphine. It was shown that cocaine, pyrogallol, apomorphine, and phenamine excited the Ss and raised the threshold of pain (mechanical stimulation of tail). When given in doses causing no such effects, these drugs tended to potentiate the analgesic action of morphine. If administered after disulfiram (teturam)—an inhibitor of dopamine-beta-hydroxylase—or on termination of stereotypy induced by large doses of phenamine or apomorphine, morphine exerted less influence on the pain threshold. Prior administration of phenamine in a dose of 2 mg/kg 1 hr. before administration of morphine not only restored, but even potentiated, the effect of morphine. Alpha-methyldopa (dopegit) raised the pain threshold and potentiated the analgesic effect of morphine. Iprazid (iproniazid)—an MAO inhibitor—weakened morphine-analgesia in "intolerant" Ss and potentiated the action of the test dose in "tolerant" Ss. Reserpine weakened morphine-analgesia. The data point to the importance of a central adrenergic mechanism, involving the freeing of labile noradrenaline, for the manifestation of the analgesic action of morphine.—*I. D. London.*

3771. Verzeano, M., Dill, R., Navarro, G., & Vallecalle, E. (U. California, Irvine) **The action of metrazol on spontaneous and evoked activity.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1099-1102.—When evoked neuronal action potentials are separated into different amplitude ranges, action potentials of progressively higher amplitudes appear at progressively later times after the stimulus and correspond to different deflections of the gross response. When metrazol is injected, either systematically or intracerebrally, neuronal activity is greatly enhanced in the higher amplitude ranges and greatly diminished in the lower. Spontaneous neuronal activity is similarly influenced by metrazol. It is suggested that (a) successive deflections of the gross evoked response correspond to the activation of groups of neuronal elements of successively increasing size, and (b) metrazol has a differential action on spontaneous and evoked neuronal activity. It impairs the activity of elements of smaller size and releases the activity of elements of larger size.—*Journal abstract.*

3772. Vikhlyayev, Yu. I., Klygul', T. A., & Astakhova, A. V. (Inst. of Pharmacology & Chemotherapy, Moscow, USSR) **O protivosudorozhnykh svoystvakh nekotorykh proizvodnykh benzodiazepina.** [On the anticonvulsant properties of several benzodiazepine derivatives.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(2), 149-154.—Rats and mice were studied to determine whether the counterconvulsive action of the benzodiazepines is the result of "true antiepileptic properties" or whether the latter are simulated through a central myorelaxant action. On inspecting the anticonvulsive activity of benzodiazepine derivatives—nitrazepam (mogadon), diazepam (seduxen), chlordi-azepoxide (elenium)—one is reminded of trimetidine (trimethadione). However, their anticonvulsant (antipentylenetetrazol) component was more marked and, to a considerable degree, they differed from the types of antiepileptic agents such as diphenine (diphenylhydanthion) and benzonal which possess high activity as

determined by the "test of maximal electroshock." Nitrazepam, diazepam, and chlorthalidone exhibited a selectivity of action for primarily convulsions of spinal origin as opposed to phenobarbital, which exerted a more marked action on convulsions, induced by stimulation of the brain.—*I. D. London.*

3773. Zabrodin, O. N. (Inst. of Experimental Medicine, Leningrad, USSR) *Vliyaniye adrenergicheskikh veshchestv na razvitiye u krysa reserpinovykh yavleniy stenki zheludka i uroven' v nei katekholaminov.* [Influence of adrenergic agents on the development in rats of reserpine-induced ulcers of the gastric wall and on catecholamine level therein.] *Farmakologiya i Toksikologiya*, 1970, Vol. 33(1), 71-73.—In 173 white rats, blocking the conduction of sympathetic nerve impulses were administered (a) 10 mg/kg hexonium (hexamethonium) in the region of autonomic ganglia, (b) 5 mg/kg ornid at the level of sympathetic nerve endings, and (c) 5 mg/kg sympatholytin at the level of the alpha-adrenoreceptors in the tissues. Hexonium was injected 15 min. before the administration of reserpine; ornid and sympatholytic 1 hr. before. Ornid averted the development of 5 mg/kg reserpine-induced dystrophy of the gastric wall and prevented the depletion of the stores of noradrenaline and adrenaline therein. Hexonium did not avert the development of reserpine-induced ulcers of the gastric walls, and the decrease in the stores of noradrenaline therein. Sympatholytin increased the number of destructive changes in the stomach wall while failing to prevent a decrease in catecholamine content therein.—*I. D. London.*

Chloridine and sulfapyridazine, and aminoquine and sulfadimezine are combinations which proved most effective in treating acute toxoplasmosis—a disease seriously involving the CNS.—*I. D. London.*

CARDIOVASCULAR PROCESSES

3775. Amlil, C. Robert. (Ohio U.) *Hyperosmolality accompanies hypovolemia: A simple explanation of additivity of stimuli for drinking.* *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1021-1028.—Measured water intakes (I) and blood plasma conditions of 13 male Holtzman albino rats in Exp. I following: (a) injection of hypertonic saline, (b) hemorrhage, and (c) injection + hemorrhage. Water intakes were additive, i.e., $I_a + I_b = I_c$. Significant plasma osmotic pressure elevations were obtained under all conditions, even following hemorrhage which was previously thought to be free of osmotic pressure changes. Exp. II, with 17 similar Ss, determined plasma conditions at various times following hemorrhage. Hemorrhage induced plasma hyperosmolality was found to be coincident with the onset of drinking only, with no changes from ad lib levels at the other times tested. Results are discussed in terms of the hyperosmotic and hypovolemic additivity of water intakes, and the adequate internal stimulus for drinking. (16 ref.)—*Journal abstract.*

3776. Horvath, T. (U. Windsor, Ontario, Canada) *A simple transmitter mount for short-term telemetric*

measurement of heart rate in the rat. *Behavior Research Methods & Instrumentation*, 1970(Sep), Vol. 2(5), 246.—Describes a simple nonsurgical technique for mounting a small telemetry transmitter on a laboratory rat. The method is useful for collecting heart-rate data in studies of 2 or 3 days' duration.—*Journal abstract.*

3777. Jolley, Alan. (University Coll., Cardiff, Wales) *Effects of food deprivation and consummatory activity on the heart rate of the rat.* *Animal Behaviour*, 1970(Feb), Vol. 18(1), 92-95.—Measured heart rate in differentially food-deprived groups of rats before and after deprivation, and after 5 min. of postdeprivation consummatory activity. Deprivation per se had no significant effect on heart rate. However, heart rate recorded during consummatory activity was found to be higher in the 48- and 72-hr deprived groups, than in the 24-hr deprived Ss, although eating rate was found to be inversely related to length of deprivation. No significant differences were found between heart rate changes in the 48- and 72-hr deprived groups. The increasing linear function predicted by theory was not demonstrated. Possible reasons for this are discussed.—*Journal summary.*

3778. Pappas, Bruce A., DiCara, Leo V., & Miller, Neal E. (Rockefeller U.) *Learning of blood pressure responses in the noncurarized rat: Transfer to the curarized state.* *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 1029-1032.—Trained 9 free-moving Sprague-Dawley rats to increase, and 8 to decrease, systolic blood pressure in order to avoid and/or escape electric shock. The initial difference in blood pressure between the 2 groups was small and did not approach significance. The training produced changes in the rewarded directions, with the difference between the changes being reliable and producing an overall difference of 9.7 mm. Hg. No corresponding changes were found for heart rate or gross skeletal activity. The blood pressure responses failed to transfer to the curarized state. However, subsequent training in the curarized state produced a difference between the increase and decrease groups of 21.2 mm. Hg. There was some indication that the blood pressure responses in the curarized and noncurarized training sessions were positively correlated. (15 ref.)—*Journal abstract.*

3779. Reeben, V. A. & Epler, M. A. *Sledyashchaya sistema dlya nepreryvnogo izmereniya srednego arterial'nogo davleniya.* [Tracking system for continuous measurement of average arterial pressure.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." ENVIRONMENT & STRESS

3780. Blumenfeld, Michael; Rose, Leslie I., Richmond, Lewis H., & Beering, Steven C. (State U. New York, Downstate Medical Center, Brooklyn) *Dexamethasone suppression in basic trainees under stress.* *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 299-304.—Compared 18 airmen basic trainees, evaluated in the Mental Hygiene Clinic (MH group), to 30 control trainees (C group) who did not need psychiatric evaluation. The mean anxiety and depression scores on the Zuckerman-Lubin Multiple Affect Adjec-

tive Check List (MAACL) of the MH group were significantly higher than the C group, although both groups were higher than several previous populations tested with the MAACL. There was no significant difference between the 5-hr urinary base-line 17-hydroxycorticosteroids level of the C group and that of the MH group. However, the mean steroid level of the MH group was significantly higher than the C group after dexamethasone suppression. 3 of the C group and 6 of the MH group did not meet criteria for suppression with dexamethasone. The 3 C group nonsuppressors when retested after completion of training showed suppression, with 2 Ss showing significant decrease in their anxiety, depression, and hostility scores on the MAACL. It is concluded that emotional stress can be a cause for the failure of dexamethasone suppression. Data appear to establish the overnight suppression test as a more sensitive test for examining steroid levels as a reflection of emotional stress than using base-line levels. (18 ref.)—*Journal summary*.

3781. Bundzen, P. V. (Inst. of Experimental Medicine, Leningrad, USSR) *Vliyaniye svetovogo rezhima antarktycheskogo kontinenta na sostoyaniye avtoregulyatornykh funktsii golovnoy mozga cheloveka*. [Influence of the natural photic conditions of the Antarctic continent on the state of the autoregulatory functions of the human brain.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 929-939.—Evaluated the state of the autoregulatory functions of the brain during the south polar day and night, utilizing EEGs of 10 men in combination with automatic frequency analysis of cerebral biocurrents and autostimulation in rhythm with the oscillations of "envelope alpha-activity." The daily and seasonal conditions of light, to which Ss are habituated, were an important environmental factor determining the functioning of the nonspecific autoregulatory mechanisms of the CNS. A disturbance of the cerebral processes, ensuring optimal control, occurred during change of the usual conditions of light and is probably due to disintegration of the functional interaction of the mesencephalic and thalamocortical regulatory subsystems of the brain. Changes in the autoregulatory functions of the CNS in the extreme conditions of Antarctica are accompanied by a temporary decline of reliability in operational performance and, in a number of cases, lead to the development of micro-symptoms of disturbed higher nervous activity. (19 ref.)—*J. D. London*.

3782. Chakrapani, T. K. (Advertising & Sales Promotion Co., Bombay, India) **Behavioral damage as a function of infantile anoxic mortality rate.** *Psychology Annual*, 1969, Vol. 3, 10-13.—3 levels of anoxia (ground level, and 30,000- and 34,000-ft altitude equivalent) were produced in 246 albino rats at 4 periods (at birth, and 1, 2, and 3 wk. after birth) with a vacuum pump. Mortality owing to anoxia was observed in the 30,000-ft altitude administration of anoxia 2 or 3 wk. after birth and in the 34,000-ft altitude administration of anoxia 1, 2, or 3 wk. after birth. Only 3 tasks—maze learning trials, maze learning errors, and discrimination—differentiated the control and experimental groups and yielded correlations ranging from +.80 to +1.—*U. Pareek*.

3783. Ingram, D. L. & Legge, K. F. (A.R.C. Inst. of Animal Physiology, Cambridge, England) **The thermoregulatory behavior of young pigs in a natural environment.** *Physiology & Behavior*, 1970(Sep), Vol. 5(9), 981-987.—Observed 28 large white pigs confined to

an area which included woodland, open pasture, and a hut containing straw. Air movement, radiant temperature, dry bulb temperature and rainfall were recorded. Ss did not begin to shelter and huddle together in the hut until ambient temperature was below 5°C, although in the laboratory the pig's metabolism increases below 25°C and behavioral studies show that below 25°C pigs will perform an operant response when the reinforcement is radiant heat. The time spent in the hut increased when the pigs were fed ad lib. Ss tended to spend most time in the area of lowest air movement, except when food was provided ad lib when Ss stayed near the food troughs. The avoidance of high air movement agrees with laboratory findings that pigs will learn to turn off a fan. No tendency was revealed for Ss to select the area of highest mean radiant temperature in spite of the ease with which pigs learn to perform an operant response for radiant heat. (20 ref.)—*Journal abstract*.

3784. Lipton, James M., Avery, D. D., & Marotto, D. R. (U. Texas, Medical School, Dallas) **Determinants of behavioral thermoregulation against heat: Thermal intensity and skin temperature levels.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1083-1088.—To further elucidate factors controlling thermoregulatory behavior, 2 experiments were conducted using 6 male albino rats trained to escape heat by holding down a lever. In both experiments the time spent responding increased in a monotonic fashion as thermal intensity was increased. Determination of the behavioral response was explored in more detail by recording dorsal skin temperature at the moment when a response was begun and when it was terminated. In a neutral environment (23°C) a relatively stable level of skin temperature was maintained in the face of intensity alterations as a result of the changes in behavior. A qualitatively similar result was also seen when Ss were tested in a hot environment (32°C). Findings are consistent with results of previous heat reinforcement experiments indicating a peripheral basis for the control of thermoregulatory behavior. In the cold (5°C), however, raising intensity brought about a linear increase in responding and in skin temperature levels maintained, suggesting that the determination of behavior in this experiment may be more complex. (22 ref.)—*Journal abstract*.

3785. Plaut, S. M., Ader, R., Friedman, S. B., & Ritterson, A. L. (Galesburg State Research Hosp., Ill.) **Social factors and resistance to malaria in the mouse.** *Psychosomatic Medicine*, 1969(Nov), Vol. 31(6), 536-552.—(This is a corrected version of the abstract which appeared in PA, Vol. 44:12071.) In a series of 9 experiments, mortality rate of malaria-infected mice was related to number of Ss per cage (1-20) but not to age, sex, and whether 1 or all Ss in a cage were infected. Individually housed Ss died as fast as grouped Ss but at 82° F rather than 70° F. Mortality rate was dependent primarily on housing conditions later in the infection period. Population size rather than density affected the mortality rate. Physical contact seems important in the high mortality rate of grouped mice. (51 ref.)—*W. G. Shipman*.

3786. Rubin, Robert T., Miller, Robert G., Arthur, Ransom J., & Clark, Brian R. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Differential adrenocortical stress responses in naval aviators during aircraft carrier landing practice.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 71-74.—Measured serum cortisol levels in 9 Navy pilots and

their flight officers during aircraft carrier landing practice in the 2-man F-4B jet aircraft. Pilots showed an unequivocal adrenocortical stress response: the flight officers did not. The complex and hazardous task of carrier landing appears to be a greater stress on the pilot in control of the aircraft than on his passive partner, although both are exposed to the same dangers. Findings highlight the importance of the active vs. the passive role as a determinant of stress intensity in so exposed to naturally occurring stress situations.—*Journal abstract*

1787 Skolnik, A. D. (Inst. of Physiology Novosibirsk, USSR) **Problemy fiziologicheskoi adaptatsii i povedeniya v ekologo-fiziologicheskikh issledovaniyakh.** [Problems of physiological adaptation and behavior in ecophysiological research.] *Fiziologicheskii Zhurnal SSSR*, 1969(Aug), Vol. 55(8), 920-928. Surveys some of the latest directions of Soviet research in "ecophysiology [environmental physiology]" embracing "both the reactions of the whole organism to natural factors of the environment including also behavior and the peripheral mechanisms securing the existence of man and animals in different physico-geographical zones." (4 ref.)—*I. D. London*

1788 Yoncheva, I. N. & Kuzmina, I. R. (Leningrad State U., USSR) **Izmeneniya reaktsii vovlecheniya pri umirani i reanimatsii zhivoiogo.** [Changes in the reactivational reaction in the process of dying and reanimation in the animal.] *Fiziologicheskii Zhurnal SSSR*, 1969(Oct), Vol. 55(10), 1203-1209. 33 cats subjected to lethal blood loss and subsequent reanimation were used to study the changes in the reactivational reaction during low-frequency stimulation of the reticular nucleus of the "non-specific" thalamic system. The reactivational reaction in the process of dying from blood loss was always maintained for a longer period than the spontaneous activity of the cortex. In dying the negative potentials of the reactivational reaction in the motor cortical zone disappeared later in 70% of the cases than the phasic evoked potentials of the visual cortex. In dying the positive phase, following the negative phase of reactivational potential, was the first to undergo reduction. In the reanimation period evoked potential in response to light was the first to be restored, and the reactivational reaction much later. (English summary) (4 ref.)—*I. D. London*

GENETICS

1789 Barot, Daniel; Barot-Niri, Homena, & Oltorin, Albertia G. (Sassari Univ.) **Genetic aspects of learning and memory in mice.** *Science*, 1969(Jan), Vol. 163(386), 139-149. Describes results from a study of avoidance behavior of different strains of mice in a shuttle box. Because of the high behavioral variability of noninbred mice, a selective breeding program was initiated using Swiss Webster mice, producing a strain of high inbreeders with low individual variability. A double-compartment grid box was used in a series of experiments. Strain differences were found in avoidance acquisition, maze-solving, type of retention preference for maximal or distributed practice, recovery of performance after a prolonged session and reactivity to psychotropic agents. In a multiple-stage retention is hypothesized to account for the findings that the speed of conditioning and "the nature of the mechanisms involved depend on strain and are genetically determined." The hypothesis is supported by the learning curves of the 2 strains of mice. The effects of ECS, aging,

and drugs on consolidation are discussed. Examples of research on the effect of environment on learning and memory are included. It is concluded that heredity plays an important role "in the determination of learning and retention mechanisms." (57 ref.)—*G. Steele*

1790 Robinson, Daniel N. (Amherst Coll.) **Heredity and achievement: A book of readings.** New York: N.Y.: Oxford U. Press, 1970. x, 444 p. \$4.95 (paper). Contains an anthology dealing with the history, nature, and applicability of behavior-genetic methods in the study of animal and human behavior. It is intended as a supplement to courses ranging from beginning psychology and biology to education, anthropology, and sociology.

1791 Walter, Roger O. & Hamilton, James B. (State U., New York Downstate Medical Center, Brooklyn) **Supermales (YY sex chromosomes) and androgen-treated XY males: Competition for mating with female killifish *Oryzias latipes*.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 128-131. In daily competitions for mating, the YY genotype was usually the victor and had higher mean values for individual components of male reproductive behavior. During androgenic treatment the XY males induced more spawnings than YY males, i.e., became victors instead of losers. Also, while XY (but not YY) males received exogenous androgen, the XY males tended to score higher mean values for all but 1 of the components of male reproductive behavior under study, whereas YY males tended to have reduced values.—*Journal summary*

PERSONALITY CORRELATES

1792 Barton, Jerry D. (Louisiana State U.) **Pupillary size as an index of preference.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 331-336. 5 male graduate students were shown groups of semierotic neutral and aversive photographs and ranked them on a pleasant-unpleasant continuum. When compared to the pupillary ranks, significant agreement between the 2 ranks was noted. The absolute pupillary size was also positively correlated with absolute subjective scores given to photographs which were viewed on the pleasant-unpleasant continuum.—*Journal abstract*

1793 Dettm, L., Kottel, L., & Fahrenberg, J. (L. Muenster W. Germany) **Eine faktoranalytische Untersuchung psychophysiologischer Korrelate.** [A factoranalytic investigation of psychophysiological correlates.] *Archiv für die gesamte Psychologie*, 1969(Aug), Vol. 120(1), 54-71. Attempts to analyze covariation of personality test variables and autonomic nervous system (ANS) variables. A sample of 160 male patients underwent a clinical interview, ANS function tests and a psychological test battery of the objective behavior and questionnaire type. From the resulting 18 variables, 81 were selected and factor analyzed. Although the mean intercorrelation of variables was low, 1st- and 2nd-order factor analysis revealed several psychophysiological loading patterns. Results support the concept of functional units in psychophysiological behavior. (17 ref.)—*English summary*

1794 Geer, James H., Darson, Gerald C., & Gatchel, Robert L. (State U., New York Stony Brook) **Reduction of stress in humans through nonveridical perceived control of aversive stimulation.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 731-748. In a RT task, 40 male undergraduates were told to react to

the onset of a 6-sec shock. Following 10 trials, 1 of the Ss were told that by decreasing their RT they would reduce shock duration. Remaining Ss were simply told that shock duration would be reduced. All Ss, regardless of group assignment or RT, received 6-sec shocks in the 2nd min of the study. During the 2nd min, Ss who believed they had control showed lower spontaneous skin conductance (SC) responses and smaller S₁ responses to shock onset than Ss who felt they had no control. Results indicate that perception of effective control, even if not veridical, can affect autonomic responding. (21 ref.)

NUTRITION & GASTROINTESTINAL PROCESSES

1179. Housh, D. A., Looze, D., & Stamen, P. C. (U. Sussex, Brighton, England). Subcutaneous dialysis in the study of the effects of nutrients on feeding. *Physiology & Behavior*, 19 (Dec), Vol. 5(10), 1201-1203. A cellophane dialysis bag containing small molecules (weight which is regulated under the skin of the rat) Sodium chloride, glucose, and hydrocortisone gave differential effects on food and water intake over the day following implantation. An unexpected decrease in food intake is seen after administering glucose by this technique, similar to that found after rapid intraperitoneal injection and unlike that found after either continuous or infusion or rapid gastric intubation. *Journal abstract.*

1180. Belygin, I. A. & Mahulovich, G. F. (Inst. of Physiol., Moscow, USSR). Otsobnovleniye sdrugov adrenalinnopodobnykh veshchestv v krov' pri introlseptivnykh i eksterolseptivnykh vyzvedeniyaakh. [Features regulating the changes of adrenaline-like substances in the blood, following exposure to intra- and

exteroceptive influences.] *Fiziologicheskii Zhurnal SSSR*, 1968 (Oct), Vol. 58(10), 1243-1244. Ss were 5 dogs with gastric and intestinal fistulae (2 with subsequent esophagotomy). Relatively weak and adequate chemical and mechanical stimulation of the receptors of the small intestine did not change, or raised only slightly, the level of adrenaline-like substances in the blood. The more marked changes occurred 15 min after interoceptive action. Prolonged distention by the balloon in the large intestine, rectum, and stomach, as well as strong electrocutaneous stimulation was accompanied by sharply expressed changes in the adrenaline-like substances whose maximum occurred 2 min after stimulation. Interoceptive influences were characterized by an increase in the quantity of adrenaline-like substances while exteroceptive influences were characterized by phasic changes. Prior unilateral section of the superior splanchnic nerve did not produce changes in the substances in response to the introduction of glucose solution into the large intestine, but it did sharply weaken changes in response to strong stimulation of the intestine and, to a lesser degree, to strong electrocutaneous stimulation. Its administration of amazine (chlorpromazine) 1 hr before the experiment sharply weakened the changes in the substances evoked by considerable intestinal distention and strong electrocutaneous stimulation, and decreased more weakly the 1st wave, without changing the 2nd wave of increase in these substances in the blood, brought about by the eating of 200 gm of meat. The characteristics of intra- and exteroceptive changes in the substances in the blood in nociceptive and alimentary reactions are explained by the specific features of their afferent link and by differences in biological significance. (21 ref.)—J. D. Jensen.

1181. Harrison, Arthur E. (Oklahoma State U.). Compensatory selection of magnesium sulfate by magnesium-depleted laboratory rats. *Journal of General Psychology*, 77 (1968), Vol. 6(3), 219-246. Recorded intakes of magnesium sulfate by Mg-depleted and by control Ss over 30 days of 2-bottle drinking tests. Depleted and control Ss offered a (0.0175 M) solution (tap water distilled water) did not differ with respect to intake of the test solution. In contrast, depleted Ss given a (0.015 M) solution drank significantly more of the test solution than did the controls. Continuing signs of hypomagnesemia in the depleted rats (as well as the latter animals' selection of the 0.015 M solution) accompanied, but did not necessarily correct the deficiency. (17 ref.)—Barbar. (Summary)

1182. Kobakova, Z. V. Metabolizm regulirovannyy integratsionno-derivatsionno-derivatsionno-organicheskimi veshchestvami: 6 primeneniye provoloknykh ksenodachnikov. [Metabolism regulated by integrative-derivative-derivative-organic substances: 6 application of fiberoptic xenodachnikov]. [Abstracts for organization and comparison of the major activity of the digestive organs with the application of new sensors devices for information processing.] In: I. R. Babitskiy (Ed.), *Metody shchepeniya i upravleniya informatsionnykh sistem*. (See PA Vol. 45 Issue 3, 216-217.) Describes a device for the graphic registration and subsequent interpretation of the major activity of the digestive organs at 4 points (points) centrally. The device is capable of recording processes which change with a frequency of 1 to 10 cps. Examples of its operation are presented. (1 D. Jensen.)

139-155.—Examines the principles underlying the construction of radiocapsules for the study of the gastrointestinal tract and other internal organs in man and animals. Designs of radiocapsules of the active and passive type and an analysis of the necessary specifications are presented.—*I. D. London.*

3802. Volynskii, Z. M. & Shevchenko, I. A. **Sravnitel'nye rezul'taty issledovaniya zheludochnoi sekretsii radiotelemetricheskimi metodami i zondirovaniem.** [Comparative results of a study of gastric secretion using the radiotelemetric method and probing.] In E. B. Babitskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 156-162.—Presents a study showing that (a) between pH, general acidity, and free hydrochloric acid in the stomach there is a nonlinear correlation, and (b) there exists an appreciable connection between them.—*I. D. London.*

3803. Werner, Emmy E. & Muralidharan, Rajalakshmi. (U. California, Davis) **Nutrition, cognitive status and achievement motivation of New Delhi nursery school children.** *Journal of Cross-Cultural Psychology*, 1970(Sep), Vol. 1(3), 271-281.—The Gesell, the Draw-a-Man, and various visual-motor development tests were administered to 24 inadequately and 16 adequately nourished Indian nursery schoolchildren of lower-class income at 6-mo intervals. IQ, head circumference, growth rate, and visual-motor development were higher for the adequately nourished, though language development was equivalent. (23 ref.)—*A. Krichev.*

ANIMAL PSYCHOLOGY

3804. Clarke, Alex M. (Macquarie U., North Ryde, New South Wales, Australia) **Geotactic responses in infra-human animals: A note on a new relationship between gravitational variables.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 67-70.—Transformations of published data on the geotactic responses of animals showed a highly significant positive concomitance between the magnitude of the angle A (between the inclined plane and the horizontal) and the true angle between the path of orientation and the horizontal plane (the angle ω). A remarkably consistent relationship exists in terms of linearity and slope of the regression plots for 6 sets of data which include observations for 4 different species (rats, mice, caterpillars, and snails). Gravitational forces acting on these lower animals moving along their path of orientation may be expressed in terms of the angle ω .—*Journal abstract.*

3805. Eaton, Randall L. (Purdue U.) **The predatory sequence, with emphasis on killing behavior and its ontogeny, in the cheetah (*Acinonyx jubatus* Schreber).** *Zeitschrift für Tierpsychologie*, 1970(Jun), Vol. 27(4), 492-504.—Anatomical adaptations permitting efficient predation during phylogeny have developed in a way different from other Felidae. Strangulation of the prey is necessary for the cheetah; it appears to require maturation of an innate tendency. "Seizing" and killing of prey depends on experience and is modifiable; stalking and chasing are relatively fixed behavior patterns. Cubs are trained by their mothers (22 ref.)—*Journal abstract.*

3806. Mariscal, Richard N. **A field and laboratory**

study of the symbiotic behavior of fishes and sea anemones from the tropical Indo-Pacific. *University of California Publications in Zoology*, 1970, Vol. 91, 43 p.—Studied the behavior and ecology of certain pomacentrid fishes (mainly Amphiprion) and sea anemones (Stoichactidae) both in the field and laboratory. Sea anemones seem to have characteristic ecological preferences. Experiments show some species of Amphiprion prefer certain species of anemone. Anemone fishes living with anemones defend territories, feed their anemones, and remove organic and inorganic material from them. Exploratory behavior and sound production of Amphiprion are also discussed. Anemone behaviors observed include locomotion, response to light, response to anemone fish, feeding, and changes in capability of nematocyst discharge. Changes in behavior of isolated anemone fishes are discussed. (3 p. ref.)—*P. L. Borchelt.*

3807. Russell, Eleanor. (U. New South Wales, Sydney, Australia) **Observations on the behaviour of the red kangaroo (*Megaleia rufa*) in captivity.** *Zeitschrift für Tierpsychologie*, 1970(Jun), Vol. 27(4), 385-404.—29 Ss were observed for a total of 126 hr. They had been reared in captivity. The behavior repertoire is described, except for reproductive behavior. In grooming behavior the whole body is groomed with all limbs, teeth, and tongue. The pouch is cleaned more often when a young is present. Responses to aggression were either counteraggression or avoidance. Mother-young interactions are divided into 5 periods: (a) young entirely within pouch (birth to about 150 days); (b) young occasionally out of pouch (150-190 days); (c) out of pouch for short periods (about 150-235 days); (d) young permanently out of pouch, but still suckling (about 235-365 days); and (e) weaning (after 365 days). After weaning, the mother tolerates her own young within a closer distance than other animals. The young also continue to feed and drink close to their mother. (21 ref.)—*K. E. Grossmann.*

3808. Spradbery, J. P. (Sirex Biological Control Unit, Silwood Park, Ascot, England) **Host finding by *Rhyssa persuasoria* (L.), an Ichneumonid parasite of siricid woodwasps.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 103-114.—These parasites explore the bark of infested timber with antennae, sustaining their antennal activity in special interest areas and probing with ovipositors to a depth of 3 mm. Drilling up to 5 mm was elicited by stimuli from within the timber. Since females can locate and parasitize dead hosts in logs, sound cannot be a necessary stimulus for drilling and is not an aid in host detection. Most drills are elicited by siricid frass. There is no evidence that tree species influences attraction.—*G. Greenberg.*

3809. Thiessen, D. D., Blum, S. L., & Lindzey, G. (U. Texas) **A scent marking response associated with the ventral sebaceous gland of the Mongolian gerbil (*Meriones ungulicatus*).** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 26-30.—The Mongolian gerbil regularly marks objects in an open field by rubbing them with a midventral sebaceous scent gland. A method and apparatus useful for the study of this response are described. The marking and gland size are sexually dimorphic, with the male marking about twice as frequently as the female and possessing a gland roughly twice the size. Ventral marking in males is positively correlated with urination and defecation, and it is suggested that all 3 of these activities may in some

situations be territorial scent marking responses.—*Journal summary*.

COMPARATIVE PSYCHOLOGY

3810. Eibl-Eibesfeldt, Irenäus. (Max Planck Inst. for Behavioral Physiology, Heidelberg, W. Germany) **Ethology: The biology of behavior.** New York, N.Y.: Holt, Rinehart, & Winston, 1970. x, 530 p. \$12.95.

3811. Gossette, Robert L. (Hofstra U., Comparative Animal Behavioral Lab.) **Note on the calibration of inter-species successive discrimination reversal (SDR) performance differences: Qualitative vs quantitative scaling.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 95-104.—Discusses 2 different approaches to the calibration of interspecies successive discrimination reversal (SDR) performance differences that have emerged over the past decade. 1, the discontinuity hypothesis, proposes a qualitative dimensional shift across vertebrates, with a 2-category scale based upon the presence or absence of error reduction on SDR tasks. The other approach, the continuity hypothesis, argues for a quantitative dimensional shift across species, with a scaling of interspecies performance differences in terms of absolute scores. Important directions for future research are suggested. (35 ref.)—*Journal abstract*.

3812. Gossow, Hartmut. (U. Freiburg, W. Germany) **Vergleichende Verhaltensstudien an Marderartigen: I. Über Lautäusserungen und zum Beuteverhalten.** [Comparative behavioral investigations on mustelids: I. Vocalization and predation.] *Zeitschrift für Tierpsychologie*, 1970(Jun), Vol. 27(4), 405-480.—16 weasels, 9 stoats, and 9 skunks were observed in captivity during a 4-yr period. All 3 species have a variable vocal repertoire. The development of vocalization in a weasel litter is presented; fractional components develop earlier than the complete calls. Distinct vocalizations are firmly connected with certain behavior patterns; i.e., during courtship vocal duets increase the mating motivation of the males and at the same time reduce reluctance in the female; mating would not occur without these vocal components. The predatory behavior of weasels and stoats is quite similar: it consists of a killing bite to the neck of the prey animal. There is usually a 2nd bite which is rather extended in time. Stoats have a fully developed prey-catching behavior at 3 mo. of age; before that time prey animals are crushed to death. (84 ref.)—K. E. Grossman.

3813. Kraus, Robert F. (Woman's Medical Coll. of Pennsylvania, Philadelphia) **Implications of recent developments in primate research for psychiatry.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 328-335.—Discusses the correlation between data obtained from the study of the social behavior of free-ranging monkeys and apes and various areas in psychiatry—growth and development, group structure and territoriality, and dominance behavior. (29 ref.)—D. Prager.

3814. Orians, Gordon H. & Christman, Gene M. (Museum of Vertebrate Zoology, Berkeley, Calif.) **A comparative study of the behavior of red-winged, tricolored, and yellow-headed blackbirds.** *University of California Publications in Zoology*, 1968, Vol. 84, 81 p.—Investigated the influence of differences in social organization upon behavior patterns. All displays and vocalizations in each species are described and illustrated, and a scheme for scoring displays according to conspicuousness is used. The results show sex and seasonal differences in the number of displays and

vocalizations. The amount of information transferred from male redwing displays and vocalizations is estimated. Intraspecific differences in displays and vocalizations are discussed in terms of speed of territory establishment, size of territory, and degree of polygamy; and the influence of habitat and plumage pattern is considered. The data prohibit a detailed motivational analysis of displays or vocalizations. (62 ref.)—P. L. Borchelt.

Attempts to account for cross-modal effects are evaluated and the concept of sensory equivalence briefly examined. (61 ref.)—*Journal abstract*.

NATURAL OBSERVATION

3817. McCullough, Dale R. (Museum of Vertebrate Zoology, Berkeley, Calif.) **The tule elk: Its history, behavior, and ecology.** *University of California Publications in Zoology*, 1969, Vol. 88, 209 p.—Observations of wild elk in California showed linear social hierarchies in both sexes. The many visual and auditory signals which integrate the herd and the dominance behaviors of both bulls and cows are described. Behaviors of bulls during the rut are described and analyzed in terms of first appearance, variation, and frequency during the season, and physiological condition of the bull. The sensory capabilities of tule elk are also discussed. (9 p. ref.)—P. L. Borchelt.

3818. Shiovitz, Kenneth A. & Thompson, William L. (Wayne State U.) **Geographic variation in song composition of the indigo bunting, *Passerina cyanea*.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 151-158.—Samples of indigo bunting songs from Michigan, Kentucky, and New York yielded 118 different figures. A high degree of geographical figure dispersion was indicated. The average song length was slightly greater in denser areas, with repetition rate being lower in denser areas. Apparently new figures result from alterations of existing figures. "The number of existing figure-types suggests that there is available to the species a finite number of different song patterns such that each bird could conceivably have a unique song. However, in nature this limit is not realized; the same song pattern is often sung by more than 1 bird."—G. Greenberg.

EARLY EXPERIENCE

3819. Denenberg, Victor H., Rosenberg, Kenneth M., Halmeyer, Gary C., & Whimbey, Arthur E. (Purdue U.) **Programming life histories: Effects of stress in ontogeny upon emotional reactivity.** *Merrill-Palmer Quarterly*, 1970(Jan), Vol. 16(1), 109-116.—Rats were handled or shocked 3 min. daily during the 1st 20 days of life, or were nondisturbed controls. 1/2 of each group was subjected to crowding stress between 21-50 days of life;

only $\frac{1}{2}$ of the groups were subjected to food deprivation between 60-65 days; and in adulthood all Ss were evaluated for open-field activity, defecation, and adrenal activity. The open-field activity measure indicated an interaction between food deprivation and infantile treatment; Ss handled in infancy were more active than controls, and nondeprived shocked Ss, however, the shocked group was the most active of the 3 food-deprived groups; the open-field defecation measure indicated a significant interaction between crowding and food deprivation and the nondeprived, noncrowded group; the adrenal activity measure indicated that handled groups released the least amount of corticosterone while the crowding group had greater corticosterone response immediately after weaning.—R. V. Hamilton.

3820. Hutchings, Donald E. & Gibbon, John. (New York State Psychiatric Inst., N.Y.) **Preliminary study of behavioral and teratogenic effects of two "stress" procedures administered during different periods of gestation in the rat.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 239-246.—Investigated the teratogenicity of prenatal maternal stress in 36 Sprague-Dawley rats and the emotional effects produced in the offspring (N = 470). To determine whether the magnitude of these effects or the direction of emotional change in the offspring depends on differences in the severity of the maternal treatments or the period in gestation when they are administered, Ss were either handled or exposed to shock-escape during the 2nd or 3rd wk. only of gestation. Both treatments were equally effective in lowering the emotionality of the offspring irrespective of the period in gestation when treatments were administered. No appreciable teratogenic effects were produced by either treatment.—*Journal abstract*.

3821. Nielsen, Thomas C. (U. Aarhus, Inst. of Psychology, Denmark) **Early experience and explorative behavior in the white rat.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(1), 1-6.—Reared 11 male albino rats in a cage with moving figures. 11 litter mates were reared in a similar cage but without figures. Ss from the more complex environment showed less locomotor activity in a checkerboard maze and, in a 2-lever test box, higher preference for the lever which produced complex visual stimuli. It is proposed that rearing in stimulus poverty increases locomotor activity and reduces curiosity.—*Journal abstract*.

3822. Vore, David A. & Ottinger, Donald R. (Indiana U., Inst. for Child Study) **Maternal food restriction: Effects on offspring development, learning, and a program of therapy.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 337-342.—Female Purdue Wistar rats were fed either ad lib or placed on a 50% ad-lib diet beginning 20 days prior to mating and continuing throughout gestation and lactation. At birth, offspring were cross-fostered to provide for independent evaluation of the pre- and postnatal effects of maternal malnutrition. All offspring were fed on an ad-lib diet following weaning. Offspring body weight deficits at birth were associated with maternal prenatal malnutrition. However, when weighed at weaning and 50 days, body weight deficits were associated only with maternal malnutrition during the postnatal period. In adulthood, offspring from mothers deprived pre- and/or postnatally made more errors on a T-maze and Hebb-Williams maze task. The therapeutic possibility of postweaning environmental enrichment was encouraging.—*Journal abstract*.

INSTINCTS

3823. Cloarec, Ann. (Ethology Lab., Rennes, France) **Etude descriptive et expérimentale du comportement de capture de *Ranatra linearis* au cours de son ontogenèse.** [Descriptive and experimental study of capture behavior of *Ranatra linearis* in the course of ontogenesis.] *Behaviour*, 1969, Vol. 35(1-2), 83-113.—"The catching and feeding behaviour of imagos ... preying upon Chironomus larvae is described.... The percentage of catching attempts which are successful increases with the age of the insect." Experiments with dummies showed that "weight, movement, speed and position with regard to predator prove to be important.... Colour differences have no effect.... A vertical downward movement is more efficacious than a vertical upward movement... but an irregular movement is even more efficacious."—N. M. Ginsberg.

3824. Davies, S. J. (Commonwealth Scientific & Industrial Research Organisation, Helena Valley, Western Australia) **Patterns of inheritance in the bowing display and associated behaviour of some hybrid *Streptopelia* doves.** *Behaviour*, 1970, Vol. 36(3), 187-214.—Presents an analysis of the bowing display of 5 species of *Streptopelia* doves and 8 derived hybrids. Using motion picture recordings and direct observation it was found that some F₁ hybrids exhibited a display intermediate between the 2 parents, some resembled 1 parent only, and some were exaggerated beyond either parent. The bowing cycle showed a typical intensity for all species and hybrids tested though the component elements of the display showed great variability both within and between species. Typical intensity suggests transmission by an uncomplicated genetic mechanism while variability in component elements suggests that the bowing display may function in ways additional to species identification. (German summary) (30 ref.)—S. R. Goldstein.

3825. Dewsbury, Donald A. (U. Florida) **Food hoarding in rice rats and cotton rats.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 174.—Recorded the amount of food hoarded in nesting jars by 17 rice rats (*Oryzomys palustris*) and 19 cotton rats (*Sigmodon hispidus*). Rice rats hoarded food; cotton rats did not. Hoarding in female rice rats appeared independent of whether Ss were wild-trapped or reared in the laboratory with continuous access to food.—*Author abstract*.

3826. Fox, M. W. & Apelbaum, J. (Washington U.) **Ontogeny of the orienting-jump response of the rabbit.** *Behaviour*, 1969, Vol. 35(1-2), 77-83.—"The ontogeny of a defensive-threat posture of the adult rabbit... was studied in New Zealand white rabbits from birth by stimulating 1 side of the body with a blunt probe. A number of components of this response were found to develop at different rates postnatally: oriented jump towards side of stimulation; hind limb thrust; vocalization; fore-limb stab; bite-attack; directed escape; striking ground with hind-limb.... Several components become incorporated during ontogeny into a complex species-specific response, which might, in the absence of ontogenetic evidence, be thought to be a simple fixed action pattern."—N. M. Ginsburg.

3827. Graue, Louis C. (Bowling Green State U.) **Orientation and distance in pigeon homing (*Columba livia*).** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 36-40.—Studied the role of distance in the initial orientation of homing pigeons by releasing birds from 8 sites. The sites were from 8-230 km. distance in the 4

compass directions. The "homeward component of the average heading vector for each of the 64 releases was computed and considered in relation to the distance of displacement." There was no indication of an intermediate zone of poor initial orientation. Some differences in homing behavior cannot be attributed to stock or methods and probably involve loft sites and release point interactions.—G. Greenberg.

3828. Muul, Ilar. (Inst. for Medical Research, Kuala Lumpur, Malaysia) **Intra- and inter-familial behaviour of *Glaucomys Volans* (rodentia) following parturition.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 20-25.—10 female squirrels and their litters were tested to determine the duration of the retrieving response, and the responses to strange young and nuts. Females showed no preference for their own young, retrieving them and strange pups about the same number of times, although younger pups were preferred to older pups until 40 days of age. It is suggested that odor is important in the female's ability to distinguish between her own and extrafamilial young over 40 days old, and extrafamilial young of any age after 40 days postpartum. Retrieving during food-storing periods was interfered with, the females retrieving nuts in lieu of their pups. "Females sometimes 'stored' their babies when these were presented after a sequence of nut retrieving."—G. Greenberg.

MOTIVATION & EMOTION

3829. Burghardt, Gordon M. (U. Tennessee) **Intra-specific geographical variation in chemical food cue preferences of newborn garter snakes (*Thamnophis sirtalis*).** *Behaviour*, 1970, Vol. 36(3), 246-257.—Tested the attack-releasing effectiveness of a variety of prey extracts on conspecific newborn garter snakes of parents found in 4 localities of 3 midwestern states. Attack frequency and related measures show a basic similarity in the type of stimuli attacked though the relative effectiveness of the extracts varied from region to region. Results indicate a within-species geographical difference in responsiveness to chemical cues, and are discussed in terms of evolutionary processes associated with local availability of food resources. (French summary)—S. R. Goldstein.

3830. Coppinger, Raymond P. (Amherst Coll.) **The effect of experience and novelty on avian feeding behavior with reference to the evolution of warning coloration in butterflies: I: Reactions of wild-caught adult blue jays to novel insects.** *Behaviour*, 1969, Vol. 35(1-2), 45-60.—Results indicate that: (1) The initial responses to various training diets were different; (2) the training diets had a direct effect on the reactions of the birds to new insects; (3) there was a difference in the attack responses of the birds to different novel insects; [and] (4) there was an interaction between training diets and novel insects."—N. M. Ginsburg.

3831. Galvani, Peter F. (State University Coll. New York, Brockport) **Air-puff-elicited startle: Habituation over trials and measurement of a hypothetical emotional response.** *Behavior Research Methods & Instrumentation*, 1970(Sep), Vol. 2(5), 232-233.—In Exp. I, it was demonstrated that an air puff elicited a reliable startle reflex in 8 male albino rats which showed no habituation over 50 trials. In Exp. II an attempt was made to measure an emotional response by recording startle reactions to the air puff during presentation of a

presumed fear-eliciting CS to 18 female albino rats. It is concluded that the air-puff-elicited startle reflex can be employed as an indirect measure of a hypothetical emotional response.—*Journal abstract*.

3832. Goodrick, Charles. (Baltimore City Hosp., Gerontology Research Center, Md.) **Light- and dark-contingent bar pressing in the rat as a function of age and motivation.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 100-104.—Determined the effects of age and food deprivation on operant responding for light onset or offset for 152 male Wistar albino rats after operant-level pretests. Results were: (a) light onset had a reward value which was similar to that for light offset, (b) stimulus change was an equally effective reward for food-deprived or non-deprived Ss, (c) the effects were invariant over the entire age range for mature Ss, and (d) response rates were greater for food-deprived than nondeprived Ss during all operant-level and stimulus-change tests. It is concluded that a change in light stimulation rather than a preference for some particular light intensity is positively reinforcing. (26 ref.)—*Journal abstract*.

3833. Hughes, R. N. (U. Canterbury, Christchurch, New Zealand) **A re-examination of the effects of age on novelty reactions and exploration in rats.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 197-201.—Observed 24 male and female albino Wistar rats of 2 ages (approximately 47 and 189 days) in an exploration box consisting of novel and familiar halves. Younger Ss travelled shorter distances and spent less time exploring than older Ss. Females engaged in more locomotion than males. However, there were no age or sex effects on preferences for being in the novel $\frac{1}{2}$ of the apparatus. There tended to be less exploration and locomotion and more grooming towards the end of a testing session than there was at the beginning. It is concluded that by confirming some previous findings, results more conclusively demonstrate the effects of age on the incidence of exploratory and locomotor activities in rats. (15 ref.)—*Journal abstract*.

3834. Hughes, R. N. & Swanberg, Karen M. (U. Canterbury, Christchurch, New Zealand) **Effects of food deprivation on exploration in deprivation-naïve rats.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 79-84.—30 male and 30 female deprivation-naïve hooded rats were food deprived for 2, 24, or 48 hr. prior to observation in an exploration box consisting of novel and familiar halves. Deprivation was found to increase preferences for being in the novel $\frac{1}{2}$ but decrease the frequency of walking responses. Licking a water tube increased with 24-hr deprivation and then decreased with 48 hr. Females reared more frequently but licked a water tube less often than males. Results tend to support the view that food deprivation heightens reactivity to novelty. They also emphasized the inappropriateness of measures of locomotion alone for assessing strength of exploration. (21 ref.)—*Journal abstract*.

3835. Ivinskis, A. (U. Newcastle, New South Wales, Australia) **A study of validity of open-field measures.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 175-183.—Obtained 76 open-field measures (defecation, ambulation, urination, washing, rearing, latency, and inner circle activity) using a number of different scoring methods for 84 Wistar albino and 19 hooded rats. The validity of these measures was examined using (a) day by day decrease of open-field behavior, (b) effects of retesting over a period of time, and (c) variation of

stimulus intensity (light and noise). It was found that Methods a and b do not provide satisfactory validity estimates. Method c indicates that defecation and latency can be accepted as valid indices of emotionality in rats.—*Journal abstract.*

3836. Ivinskis, A. (U. Newcastle, New South Wales, Australia) **The reliability of behavioural measures obtained in the open-field.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 173-177.—Obtained 7 open-field measures (defecation, urination, ambulation, washing, rearing, latency, and inner circle activity) using a number of different scoring methods for 45 Wistar albino and 43 hooded rats. Albino Ss were tested on 3 different occasions: at 90 days, 63 days later, and 154 days after the 2nd. Hooded rats were subjected to 1 test session when Ss were 90 days old. The reliability of these measures was examined using test-retest and odd-even day correlations. Results suggest that defecation, ambulation, and rearing provide reliable measures of behavior in the open field.—*Journal abstract.*

3837. Jenni, Donald A., van Iersel, J. J., & van den Assem, J. (U. Montana) **Effects of pre-experimental conditions on nest site selection and aggression in *Gasterosteus aculeatus* L.** *Behaviour*, 1969, Vol. 35(1-2), 61-76.—"Male 3-spined sticklebacks were held individually in compartments under 1 of 4 conditions: Total Isolation; Physical Isolation . . . Physical Isolation with Aggression Tests . . . and Physical Isolation with a Goldfish Companion . . . [Treatment differences] affected the numbers nesting, their choice of nest sites, their latency in responding to intruding male, and the amount of biting they directed against them. The differences in treatment did not affect the percent of individuals that built nests and responded to the test male."

3838. Lee, Ching-tse. **Preference behavior in relation to preparatory response hypothesis and information theory.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 132-137.—Analyzed preference behavior in 3 groups (10 Ss in each) of female rats in a 2-choice situation. Ss were run in a Y maze, each group receiving 1 of 3 shock probabilities: 100, 50, and 25%. A 3-way analysis of variance of Ss' mean free choices to the signal-shock side and to the shock-signal side of the maze during 3 periods of experimental sessions indicates only the main effect of periods was significant. No differences were found between the groups' free choices to the signal-shock side and to the shock-signal side during the 1st and 2nd periods, but a difference did emerge during the last period. Only the 50% group developed a significant preference for the signaled side. These results were compared with findings from similar studies and tend to support an information-uncertainty analysis of preference behavior more than a preparatory response interpretation.—*P. Hertzberg.*

3839. Livezey, P. J. & Egger, G. J. (U. Western Australia, Nedlands) **Age as a factor in open-field responsiveness in the white rat.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 93-99.—Scored 72 white male preweaning (18-day) to young adult (115-day) rats on ambulation and frequency of defecation in the open field on 2 consecutive days under various stimulus conditions. Young Ss, pre- and immediate postweaning, showed little variation under different conditions. Older Ss defecated significantly more often than younger and showed increased defe-

cation and decreased ambulation from Day 1 to Day 2 and over successive 1/2-min periods in the field. Results suggest that the young S becomes reactive to light stress in the open field shortly after weaning. An escape reaction to such stress is suggested by initially high ambulation and low defecation scores. When this is not successful, activity rapidly decreases and, with increasing stress, defecation rises.—*Journal abstract.*

3840. Petchkovsky, Leon & Kirkby, Robert J. (U. Sydney, New South Wales, Australia) **Individual differences, emotionality, and spontaneous alternation in mice.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 75-78.—Investigated spontaneous alternation performance in 20 Quackenbush strain mice over a series of 13 trials. Significant differences in spontaneous alternation were found between individual mice. No significant correlations were found between rate of spontaneous alternation and emotionality as measured by defecation and latency to leave the startbox. Defecation and latency to leave the startbox appeared to increase over the series of trials.—*Journal abstract.*

3841. Sale, Peter F. (U. Sydney, New South Wales, Australia) **A suggested mechanism for habitat selection by the juvenile manini *Acanthurus triostegus sandvicensis* Streets.** *Behaviour*, 1969, Vol. 35(1-2), 27-44.—"Intensity of habitat exploration is regulated through a negative feedback mechanism by the character of the immediate environment with respect to the pertinent stimuli. A fish in an inadequate environment will show a high intensity of habitat exploration. I in an adequate environment will show a much reduced level of exploration. 20 manini were exposed singly to 4 test environments of known relative value as habitats. Each fish received all 4, and order of exposure was randomized. Analysis of 13 components of behaviour showed that exploration did vary in the manner predicted."—*N. M. Ginsburg.*

3842. Strouthes, Andrew. (State U. New York, Binghamton) **Long-range two-choice saccharin and water consumption in rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 123-134.—Saccharin preference by naive male albino and pigmented rats on ad-lib feeding and on long-range choice between saccharin and water was 1st an increasing and then a decreasing joint function of saccharin concentration and exposure time. Water 1st decreased and then increased but only as a function of saccharin concentration. Periodic saccharin fluctuations, function of saccharin concentration, had no detectable counterpart in the water intake of low-saccharin concentration groups but affected the water of the higher concentration group so that the periodicities of saccharin and water were of opposite phase. An accommodation process requiring water's compensatory action in the case of the high concentration was proposed. (18 ref.)—*Journal abstract.*

3843. Weiss, Ira P. (Syracuse U.) **Nutritional and non-nutritional factors underlying food-deprivation-polydipsia in the gerbil (*Meriones unguiculatus*).** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 429-430.

LEARNING

3844. Chesler, Phyllis. (New School for Social Research) **The cognitive effects of the maternal-**

infant bond on learning by observation in the kitten. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 409.

Conditioning

3845. Dua, J. K. & Stanley, Gordon. (U. New England, Armidale, New South Wales, Australia) **Reinforcement effects in differential conditioning.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 5-10.—Using a nonchain delay situation in a Skinner box, 6 groups of 8 male albino rats each were trained to press a bar in response to tones of 8000 and 2000 Hz., but were reinforced in the presence of only 1 of these tones either .5, 4, or 7 sec. after the bar press. The tone changed to 4000 Hz. after the delay interval at which time reinforcement occurred. Learning occurred in all groups though the groups with greater CS-UCS interval were slower in rate of learning. This result was considered to support the R. A. Champion and L. R. Smith modification of K. W. Spence's incentive-motivation hypothesis.—*Journal abstract*.

3846. Krickhaus, E. E. (U. Massachusetts) **"Innate recognition" aids rats in sodium regulation.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 117-122.—25 thirsty male Long-Evans rats, with no need for sodium, were taught for several wk. to run to 1 arm of a T maze for distilled water and to the other arm for a much less acceptable hypertonic sodium solution. Ss were then tested for their side preference when not thirsty, with all solutions removed and under conditions of either sodium depletion or no sodium depletion. There was a highly reliable tendency for Ss to run more often to the arm which had previously contained sodium when sodium depleted than when not sodium depleted. Ss trained in a similar manner with potassium chloride vs. water, when subsequently sodium depleted, showed no tendency to run more often to the arm which had contained potassium. Thus, a rat appears capable of learning where and what sodium is without at the time wanting sodium, and later, when he does want sodium but no sodium is available, of knowing what he wants and of attempting to procure it.—*Journal abstract*.

3847. Liu, In-mao. **Temporal course of CR formation.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 52-58.—10 goats were subjected to an avoidance conditioning procedure in which they responded to a 1200-msec light by inhibiting their legs' being pulled forward to avoid an electric shock. An external force to pull forward the Ss' legs followed the light onset by 200 msec. in 1 session and 1200 msec. in another. During each session, test trials, on which the external force followed the light onset by 0, 100, 200, and 1200 msec., were administered. It was found that a clear generalization gradient specific to each stimulus-force training interval was obtained. Another way of studying the fundamental nature of conditioning is suggested since a temporal generalization gradient exhibits a temporal course of CR formation.—*Journal abstract*.

3848. Schaefer, H. H. (Patton State Hosp., Calif.) **Self-injurious behavior: Shaping "head-banging" in monkeys.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 111-116.—Head-banging, a common phenomenon among the mentally retarded, was shaped, brought under stimulus control, extinguished, and reestablished in 2 male rhesus monkeys through

reinforcement and discrimination procedures of operant conditioning. The behavior was stable and led to lacerations, a condition that qualifies head-banging as self-injurious. The principles of the analysis of behavior used here may well be of value in the etiology and treatment of some human head-banging.—*Journal abstract*.

3849. Thorne, David R. (Arizona State U.) **An analysis of the response durations and pauses comprising interresponse times.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 428.

3850. Vitulli, William F. (U. South Alabama) **Interactive effects of shock, insulin, and food pellet properties on operant behavior.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 127-138.—Trained 2 male albino Holtzman rats on multiple and concurrent schedules of reinforcement to assess the interactive effects of shock, insulin, and food pellet properties. The intensities of shock were .4 ma. and .8 ma. The temporal intervals between pellet occurrence and shock onset were 0, .5, 1, and 2 sec. The doses of insulin were 4, 12, 20, and 28 units. The types of pellets were Noyes sucrose and Noyes standard. The effects of the parameters on these variables were studied in comparison to the steady state behavior of Ss under the multiple and concurrent schedules. Rates of responding changed systematically as a function of shock and pellet type. Insulin produced considerable variation in responding.—*Journal abstract*.

Discrimination

3851. Blake, G. M. (Agricultural Research Council, Pest Infestation Lab., Slough, England) **An incomplete randomized block design, illustrated by a study of humidity discrimination in *Anthrenus verbasci* (L.) (Col., Dermestidae).** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 96-102.—Studied the humidity preferences of both adults and young larvae in an alternative chamber. The results were analyzed by means of an incomplete randomized block design. The humidities, presented in all possible pairs in the chamber, were 30, 50, 70, and 90% relative humidity. Ss used in all 4 experiments were able to discriminate between the 4 humidity levels and generally congregated in the lower of any pair presented. The power of discrimination between any 2 humidities was proportional to the difference between them and was not dependent upon the actual values of the humidities involved.—*Journal summary*.

3852. Blough, Donald S. (Brown U.) **Attention shifts in a maintained discrimination.** *Science*, 1969(Oct), Vol. 166(3901), 125-126.—3 white Carneaux pigeons received lights of varying wavelengths paired with sounds of varying frequencies; pecking was reinforced only at 1 stimulus combination. Then either the light or the sound was held constant at its reinforced value, while the other stimulus continued to vary. Subsequent tests show that the constant stimulus lost much of its control over Ss' responses.—*Journal abstract*.

3853. Cardu, Bruno. (U. Montreal, Quebec, Canada) **Application of the method of second order sign behavior to the study of non-spatial delayed response in rhesus monkeys.** *Behaviour*, 1969, Vol. 35(1-2), 128-136.—Choice stimuli were 2 wooden objects, a square and a cross. Signal stimuli were (for 3 Ss) a pair of intermittent lights of different frequencies, and

(for 4 Ss) a pair of intermittent sounds. Following training to match the signal stimuli with the correct choice objects "an interval between the termination of the 1st signal and the moment of choice was then introduced.... All Ss succeeded in this task; the limits of the memory span ranged from 20-45 sec."—N. M. Ginsburg.

3854. Ely, David J. (U. Nevada) **Discrimination of stripes at different angles by the rat.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 411.

3855. Mackintosh, N. J. & Honig, W. K. (Dalhousie U., Halifax, Nova Scotia, Canada) **Blocking and enhancement of stimulus control in pigeons.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 78-85.—Trained 60 white Carneaux pigeons in Stage 1 on a line-tilt discrimination, while controls rested. In Stage 2, $\frac{1}{2}$ of each group was trained to discriminate between 2 wavelengths compounded with the Stage 1 lines, while the remainder were simply reinforced for responding to the positive line compounded with a single wavelength. All Ss were finally given a wavelength generalization test. Line-tilt training in Stage 1 reduced control by wavelength in Ss given discrimination training in Stage 2, but enhanced wavelength control in Ss given single-stimulus training in Stage 2. (17 ref.)—*Journal abstract*.

3856. Richardson, William K. (U. Kentucky) **An investigation of some successive and simultaneous operant discrimination procedures.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 423.

3857. Richman, Charles L. & Coussens, Wayne. (Wake Forest U.) **Undertraining reversal effect in rats.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 340-342.—4 groups of 8 male albino Sprague-Dawley rats were either undertrained, criterion trained, overtrained, or strictly overtrained in a T-maze on a simple spatial discrimination problem prior to reversal learning. As a function of increased preshift training levels, Ss reversed the problem in less days, demonstrating the overtraining reversal effect. The speed of reversal learning was inversely related to the level of spontaneous alternation behavior during the initial stages of reversal training.—*Journal abstract*.

3858. Swihart, C. A. & Swihart, S. L. (State University Coll. New York, Fredonia) **Colour selection and learned feeding preferences in the butterfly, *Heliconius charitonius* Linn.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 60-64.—Presented an array of 7 differently colored papers (plus white and gray) to the Ss inside an insectary. The most feeding attempts were made to blue/blue-green and orange/red papers. To assess learning ability in this animal, food was presented on a single color model and then testing was carried out with a multicolored array. Substantial learning was demonstrated by the butterflies increased "preference" for the colored models that previously contained food. (17 ref.)—G. Greenberg.

3859. Thomas, David R., Burr, D. E., & Eck, Kenneth O. (U. Colorado) **Stimulus selection in animal discrimination learning: An alternative interpretation.** *Journal of Experimental Psychology*, 1970(Oct), Vol. 86(1), 53-62.—In Exp. I, 8 male albino Sprague-Dawley rats were trained in an operant free-responding situation to discriminate between 2 tone-plus-light compounds in which the tones differed in frequency but the light was always the same. A 2nd group, paired with the 1st, received nondifferential training with the same 2 stimuli.

All Ss were then tested in extinction for response strength to the compound that had been the S+ for the discrimination-trained Ss and to the (relevant) tone component of that compound. Discrimination-trained Ss responded more to the compound but less to the tone-alone condition. Results are consistent with the proposition that discrimination training makes Ss more attentive to all stimulus change. Exp. II investigated whether discrimination-trained Ss would be more responsive to variations in the light stimulus which had been the irrelevant element in discrimination training. 2 groups of 6 rats each were trained as in Exp. I. Testing for response strength in extinction included each tone paired with the training light and with a novel (dimmer) light, plus the 2 light intensities presented without any tone. Discrimination-trained Ss responded less to both lights when presented alone, but neither group responded differentially to the 2-light values, whether presented alone or in combination with the tones. Exp. III tested the hypothesis that the presence of the tones during testing had masked stimulus control by light intensity in Exp. II. It was anticipated that in the absence of such masking, greater stimulus control by light intensity might be demonstrable in discrimination-trained Ss. 12 Ss, tested as in Exp. II, replicated the earlier result. Another 12 Ss, tested with the 2 lights only, yielded reliable decremental gradients which were lower and steeper for the discrimination-trained group. Results are consistent with literature demonstrating that the effects of discrimination training extend to stimulus dimensions other than those relevant in such training. (15 ref.)—*Journal abstract*.

3860. Winefield, A. H. & Jeeves, M. A. (U. Adelaide, South Australia) **The role of position responding in simultaneous discrimination acquisition and reversal.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 201-206.—Examined discriminative acquisition and reversal learning in the presence and absence of visual cues to spatial position. Ss were 20 male Wistar rats. In the discrimination learning no effect on performance was observed, but in the reversal learning several Ss for whom the spatial cues were absent, apparently developed abnormal fixations. Results are consistent with earlier studies and are interpreted in accordance with frustration theory. They confirm previous results which indicate that the commonly held view that position responding in simultaneous discrimination learning is always a source of interference may be mistaken.—*Journal abstract*.

Avoidance & Escape

3861. Bolles, Robert C., Hargrave, George E., & Grossen, Neal E. (U. Washington) **Avoidance learning as a function of CS quality and CS termination on escape trials.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 27-32.—Trained 14 groups of 8 female Wistar rats each in a shuttle box with 1 of 5 CSs and with either immediate or delayed CS termination on escape trials. An avoidance response always produced immediate CS termination. Differences among CSs were found, but with all CSs there was a decrement under the delay condition. This decrement is explained on the basis that CS termination serves as a reinforcing safety signal, and the safety signal is more effective when it is response contingent.—*Journal abstract*.

3862. Campbell, Byron A. & Moorcroft, William H.

(Princeton U.) **Relative aversiveness of subcutaneous shock and footshock in the rat.** *Behavior Research Methods & Instrumentation*, 1970(Sep), Vol. 2(5), 222-224.—Assessed relative aversiveness of subcutaneous shock and footshock in 2 adult male Sprague-Dawley rats by means of a spatial preference technique. Subcutaneous shock was less aversive than footshock by a factor of 10, except at near lethal shock intensities, where receptor-cell hyperpolarization, electrocauterization, and/or muscular tetanization may have occurred.—*Journal abstract.*

3863. Cheng, Chao-ming. **Stimulus intensity effect and response latency.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 138-143.—Describes an investigation of the relation between the response latency to CS and the stimulus-intensity effect in the escape learning situation. It was hypothesized that the stimulus intensity effect would be more pronounced under the condition of a shorter response latency than that under the condition of a longer one. The UCS was an electrical shock, and both the CS and the testing stimuli were commercial buzzing sounds. 40 white rats were divided into 2 groups, 1 was tested under the condition of .3 sec. response latency, the other was tested under the response latency of 1.2 sec. On the training trials, the termination of CS was followed immediately by the UCS onset. Results support the above hypothesis.—*Journal abstract.*

3864. Graham, Thomas M. & Longstreth, Langdon E. (U. Southern California) **The role of frustrative non-reward in instrumental escape conditioning.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 185-192.—Attempted to determine whether Amsel's frustration effect would appear in the instrumental escape situation. The usual double-alley apparatus was used, along with a within-Ss experimental design. Ss (N = 62 naive male Long-Evans rats) were always shocked in Alley 1 and in Goalbox 1 1/2 the time; when Goalbox 1 was white it was always paired with shock, and when it was black it was not paired with shock. Its color was easily observable as S approached it from Alley 1. On test trials Goalbox 1 was paired with shock regardless of color. A clear frustration effect was found: when Goalbox 1 was black-plus-shock, Ss entered Alley 2 significantly faster than when Goalbox 1 was white-plus-shock. Evidence suggestive of anticipatory responses was also observed: during training Alley 1 speed became slower if Goalbox 1 contained the color paired with shock, and during test trials Alley 1 speed increased if Goalbox 1 contained the color paired with frustration. It is concluded that Amsel's theory as applied to the escape situation was generally confirmed.—*Author abstract.*

3865. Pilley, John W. (Memphis State U.) **Spontaneous recovery of an escape response as a function of drive and length of recovery interval.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 420.

3866. Ray, A. Joseph. (Carleton U., Ottawa, Ontario, Canada) **Instrumental avoidance learning by the tiger salamander *Ambystoma tigrinum*.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 73-77.—This animal learned to anticipate and eliminate the onset of a negative stimulus (bright light) by passing into a safe compartment when an innocuous stimulus (vibration) was presented before the light. Performance of avoidance responses increased gradually until many animals were 90% correct on the last 2 days of training. All Ss that learned the avoidance

response frequently performed it. The interval between trials and between the 2 sequential stimuli did not affect the rate of learning. (15 ref.)—*Journal summary.*

Reinforcement

3867. Capaldi, Elizabeth D. (Purdue U.) **Effect of an initial reward magnitude on subsequent resistance to extinction.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 283-287.—Reward magnitude in Phase 1 (1 or 16 pellets) and Phase 2 (1 or 16 pellets) was varied in a 2 x 2 factorial design employing 48 naive female rats as Ss. Resistance to extinction (Phase 3) was influenced by Phases 1 and 2 reward magnitudes. Previous studies, employing a smaller number of trials, failed to find an influence of Phase 1 reward on extinction. The present and previous results are interpreted within sequential theory.—*Journal abstract.*

3868. Glow, P. H. (U. Adelaide, South Australia) **Some acquisition and performance characteristics of response contingent sensory reinforcement in the rat.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 145-154.—Studied the lever-pressing behavior of 2 groups of 11 female Wistar hooded rats each; the 1st group received response contingent light on and the 2nd received response contingent light off. On a variety of measures, light off stimulation was found to be more reinforcing than an equal period of light on. The 2 groups could be distinguished with respect to the shape of their acquisition and performance curves. Sensory reinforcement of bar pressing was also investigated with a requirement of 2 responses for stimulus change, and when the on- or offset of light was controlled by the S. An adequate explanation for the performance phase of sensory contingent bar pressing is that sensory change as such is reinforcing, provided that the stimulation parameters are appropriate. (20 ref.)—*Journal abstract.*

3869. Seggie, J. L. & Halford, G. S. (U. Newcastle, New South Wales, Australia) **The secondary reinforcing properties of a stimulus not associated with reward.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 185-190.—Ran 4 groups of 8 partially reinforced male hooded rats each in a T-maze. During a delay period at the choice point 1 of 2 signal stimuli was presented to all Ss. The information value of the signals was varied for each group and was a function of the reliability with which the stimuli predicted reward or location. Results indicate that the secondary reinforcement value of the signal stimuli was related to their reliability as predictors of both reward and location, rather than to their association or nonassociation with primary reinforcement.—*Journal abstract.*

Reinforcement Schedule

3870. Keehn, J. D. (York U., Toronto, Ontario, Canada) **Schedule-induced licking and polydipsia.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 155-161.—Made detailed observations of the eating and drinking behavior of a pair of hooded rats under a variable interval (VI) 1 min. schedule of food reinforcement after 1 of them had been trained alone to bar-press. Reinforcements could be consumed by either S. The executive nearly always drank after eating, the other never did. Eventually the control acquired the bar-press response. When it was then run alone it too came to drink after eating. It is argued that as drinking after

eating is a result of reinforcement scheduling it is improper to ascribe schedule-induced polydipsia to a tendency of rats to drink after eating. Instead it is suggested that a wet mouth becomes a discriminative or otherwise favorable stimulus for bar-pressing with food reinforcement.—*Journal abstract.*

Punishment & Extinction

3871. Fa-yu, Cheng. **Effect of antenatal nutrition condition on the relation between amount of effort and extinction.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 40-44.—Hypothesized that effort may be under the effect of body weight gain conditions. The methods of prenatal dietary restriction and bar press in a Skinner box were used. 40 albino rats, 20 of which were from dietary restricted ($1/2$ of usual diet from the day of gestation) mothers and the other 20 of which were from normally fed mothers, were trained to press a bar in the Skinner box. The bar weight for a $1/2$ of each group was 50 gm. and for the other $1/2$ was 10 gm. Then they were run extinction trials with the weight shifted bar (50 gm. shifted to 10 gm. and 10 gm. to 50 gm. in extinction trials). Results obtained by the total number of bar press responses in 3 extinction series on 3 consecutive days, do not support the hypothesis. Only the weight of the press-bar in extinction could have effect on the rate of extinction.—*Journal abstract.*

3872. Reynierse, James H. & Rizley, Ross C. (Hope Coll.) **Stimulus and response contingencies in extinction of avoidance by rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 86-92.—Examined extinction of shuttle-box avoidance under several extinction operations. Ss were 64 adult male albino rats. 2 groups had CS-only conditions in which CS termination was immediate or delayed, and 4 groups had CS and UCS presented randomly in which CS and UCS were both terminated immediately, CS or UCS (but not both) were terminated immediately, or both CS and UCS terminations were delayed. These operations include all combinations of stimulus and response contingencies present during extinction of avoidance. A conventional CS-only procedure in which both stimulus and response contingencies were present produced the greatest resistance to extinction. Eliminating response contingencies associated with the CS and eliminating stimulus contingencies produced intermediate effects. Finally, extinction was most rapid when response contingencies associated with the UCS (UCS delay) were eliminated. (18 ref.)—*Journal abstract.*

SOCIAL & SEXUAL BEHAVIOR

3873. Cole, L. R. (16 Chance Lane, Guilford, England) **Observations on the finding of mates by male *Phaeogenes invisor* and *Apanteles medicaginis* (Hymenoptera: Ichneumonidae).** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 184-189.—Similar mechanisms for locating mates operated in both species studied. Unmated females emitted a scent to which males responded. P. invisor males could respond over distances up to 200 cm.; A. medicaginis males could respond over distances up to 90 cm. Males that flew out of the scent range showed no consistent behavioral changes with respect to mate location.—G. Greenberg.

3874. Dunford, Christopher. (U. Arizona) **Behavioral aspects of spatial organization in the chipmunk,**

***Tamias striatus*.** *Behaviour*, 1970, Vol. 36(3), 215-231.—Investigated the role of agonistic behavior and vocalizations in maintaining the spatial organization found in a population of 12 eastern chipmunks. Agonistic encounters were observed at seed piles while vocalizations were tape recorded and converted to sonograms. It was found that dominance relations established on neutral territory could be modulated by moving a seed pile toward the hole of a given chipmunk. A vocalization termed "chipping" occurred most often within the Ss core area, while the "chip-trill" call occurred most frequently outside the core area. A preliminary experiment indicates that chipping may function as an agonistic signal, inhibiting the approach of conspecifics. The concept of loose territoriality is used, in part, to discuss the adaptive significance of chipmunk social organization. (French summary) (22 ref.)—S. R. Goldstein.

3875. Eaton, Randall L. (Purdue U.) **Group interactions, spacing and territoriality in cheetahs.** *Zeitschrift für Tierpsychologie*, 1970(Jun), Vol. 27(4), 481-491.—The spacing technique works on a time basis. Marking appears to act as a means of defending any area against intruders; the effect, however, is short. The relation between group size and mortality, and predation on cheetah as the factor most likely limiting cheetah numbers are discussed. A definition of territoriality is offered, and it is advocated that the "time-plan" of spacing is a special case of territoriality. (29 ref.)—*Journal abstract.*

3876. Ferguson, Gary W. (Kansas State U., Div. of Biological Sciences) **Mating behaviour of the side-bellied lizards of the genus *Uta* (Saural: Iguandidae).** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 65-72.—Describes 4 stages of the mating behavior: approaching, licking, neck-holding, and copulating. Some aspects of mating behavior are more stereotyped within Uta populations than between populations. However, none of the geographic differences were sufficiently great to be useful for subspecific diagnosis. Absence of "head jerk" behavior and short copulation may indicate ancestral affinity between Texas and Santa Catalina Island Uta. A higher degree of intraspecific aggression and shorter life expectancy in some Uta populations may be directly or indirectly responsible for the presence of circling behavior, longer duration of the licking stage, and the shorter duration of copulation in those populations.—*Journal summary.*

3877. Gardner, Eliot L. & Gardner, Elizabeth B. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Orientation of infant macaques to facially distinct surrogate mothers.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 409-410.—Examines the development of affective behavior in "2 infant rhesus monkeys... removed from their mothers and each placed in a cage containing 2 terrycloth covered mother surrogates" similar to those used by H. Harlow except for the faces, 1 square and 1 round. Results indicate a preference for the square face. It is concluded that the data further emphasize the importance of contact comfort and suggest that attentional variables exist in infrahuman primates.—G. Steele.

3878. Losey, George S. (Hawaii Inst. of Marine Biology, Kaheohe) **Sexual pheromone in some fishes of the genus *Hypsoblennius* gill.** *Science*, 1969(Jan), Vol. 163(3863), 181-183.—Found a pheromone in the males of some species of *Hypsoblennius* which facilitates

male courtship by releasing sexual appetitive behavior and by increasing sexual receptivity. Females and egg-guarding males were not attracted by this pheromone under experimental conditions.—*Journal abstract*.

3879. Oldfield-Box, Hilary. (U. Reading, England) **Experimental manipulation of individual performance within groups of rats engaged in a "social problem."** *Psychological Reports*, 1970(Feb), Vol. 26(1), 219-225.—5 experiments showed divisions of labor were not maintained in 3 of 4 groups of naive black hooded Norway rats with differing schedules of reinforcement. Altering schedules of Ss in established groups did not relate to later behavior. When Ss were trained on 1 task and shifted, to the other, variability increased.—*Journal abstract*.

3880. Payne, Robert B. (U. Oklahoma) **Breeding seasons and reproductive physiology of tricolored blackbirds and redwing blackbirds.** *University of California Publications in Zoology*, 1969, Vol. 90, 137 p.—In southern California, Redwing blackbirds (*Agelaius phoeniceus*) nest only in spring, whereas closely related sympatric tricolored blackbirds (*Agelaius tricolor*) nest in spring and, in smaller numbers, in autumn. Field observations show both species are polygamous, tricolors hold temporary territories while redwing territories are permanent throughout the breeding season; the nesting schedule for tricolors is shorter than for redwings; and in comparison with tricolors, redwing males have an insignificant role in feeding the young. Seasonal changes in testes, ovaries, plumage, and weight are described. Males and females of both species develop large gonads in response to long artificial day lengths. Experiments showing gonadal response to natural autumnal day length in male tricolors in which the photorefractory period is terminated early suggest that males breeding in autumn are the same males which bred successfully in early spring, since the testes of males feeding young in spring regress earlier than do testes of other males. Female tricolors developed enlarged ovaries in early autumn when fed live grasshoppers or soaked in simulated rains. (9 p. ref.)—P. L. Borchelt.

3881. Peeke, Harman V. & Peeke, Shirley C. (U. California, San Francisco) **Habituation of conspecific aggressive responses in the Siamese fighting fish (*Betta splendens*).** *Behaviour*, 1970, Vol. 36(3), 232-245.—Live male Ss were used as stimuli to study the habituation of aggressive display and biting in conspecific adult males. Of the 3 groups studied, 1 (E-15) received a daily 15-min exposure to the stimulus Ss for 20 consecutive days. Group II (C-15) received this same stimulation for the first and last 2 days of the 20-day test session. Group III (E-60) received the same total amount of stimulation as E-15 over a 5-day period by extending the daily session length to 1 hr. Groups E-15 and E-60 showed habituation of aggressive responses but Group C-15 did not. Biting, and the various components of aggressive display were also found to habituate at different rates. "Between-days persistence of the decrement and the results of the control group rule out interpretation of the results as being due to sensory adaptation or some fatigue process." (German summary) (16 ref.)—S. R. Goldstein.

3882. Preston, David G., Baker, Robert P., & Seay, Bill. (Louisiana State U.) **Mother-infant separation in the patas monkey.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 298-306.—Found that the 6

7-mo-old patas monkey infants used as Ss showed the typical initial agitation and subsequent decline in social behavior during a 3-wk separation. An increase in peer interaction, rather than the common rise in maternal interaction found in other species, followed reunion. 3 factors may interact to produce a less severe separation reaction and increased peer interaction following separation, as compared to the results of macaque studies: (a) patas tend to be more permissive mothers; (b) patas infants have a longer, more intense, early mother-infant relationship; and (c) contact play is a secondary play pattern in patas, but is the primary play pattern in macaques. (34 ref.)—*Journal abstract*.

3883. Shorey, H. H. & Bartell, R. J. (U. California, Riverside) **Role of volatile female sex pheromone in stimulating male courtship behaviour in *Drosophila melanogaster*.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 159-164.—Male fruitflies reared with females touched and oriented to other flies more than naive flies. Touching and/or orientation seemed to be essential to sex identification. The odor of females increased touching and orientation among male flies reared together. Male odors were not as effective as female odors in eliciting these behaviors. Female odors reduced the latency of courtship imitation in single males confined with 1 female.—G. Greenberg.

3884. Suomi, Stephen J., Sackett, Gene P., & Harlow, Harry F. (U. Wisconsin) **Developmental of sex preference in rhesus monkeys.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 326-336.—Tested socially unsophisticated rhesus monkeys (*Macaca mulatta*) of various ages for preference: (a) between a male and a female stimulus animal the same age as the Ss, and (b) between a male and a female adult feral-born monkey. In sex preference for age-mates: (a) Ss of both sexes under 7 mo. old failed to demonstrate consistent preferences for either sex of stimulus animal; (b) older Ss of both sexes made definite sex choices, exhibiting a chronological pattern of initial preference for own sex of stimulus animal followed by a shift of preference to opposite-sex stimulus animal; and (c) the preference shift occurred earlier for the females than for males. The specific sex preferences exhibited by Ss correspond closely to previously reported behavior patterns of socially sophisticated monkeys, and the chronological ages of preference shifts correspond to ages of physical maturation for rhesus monkeys. In sex preference for feral adults: (a) all Ss under 38 mo. preferred the adult female to the adult male, suggesting the existence of an unlearned preference for adult females by infant monkeys; and (b) all males over 40 mo. preferred the adult male, while all females over 40 mo. preferred the female. (25 ref.)—*Journal abstract*.

3885. van Dis, Huib & Larsson, Knut. (Netherlands Central Inst. for Brain Research, Amsterdam) **Spontaneous seminal discharge and preceding sexual activity.** *Physiology & Behavior*, 1970(Oct), Vol. 5(10), 1161-1163.—Inspected 60 male Wistar rats, prevented from genital grooming during a 12-day period, for the deliverance of spontaneous seminal deposits after varying amounts of preceding sexual activity. An inverse relationship was found between number of ejaculations permitted and the amount of seminal plugs delivered.—*Journal abstract*.

3886. Watson, Michael. (Princeton U.) **Significance of antiphonal song in the eastern whippoorwill, *Psophodes olivaceus*.** *Behaviour*, 1969, Vol. 35(1-2),

157-178.—Field recordings were analyzed spectrographically, showing "an overall constancy of male song and a marked geographical variation in female song. Male song is shown to consist of 2 components: the introduction, which is individually variable; and the whip-crack, which is rigidly species specific. . . . The female antiphonal component shows an individual variation but a constant pattern in any 1 area. . . . Function of antiphony in this species [is]: maintenance of contact, maintenance of the pair bond, and territorial advertisement and display."—N. M. Ginsburg.

3887. Wilz, Kenneth J. (Williams Coll.) **Causal and functional analysis of dorsal pricking and nest activity in the courtship of the three-spined stickleback *Gasterosteus aculeatus*.** *Animal Behaviour*, 1970(Feb), Vol. 18(1), 115-124.—Dorsal pricking behavior was displayed when aggressive motivation was high. By eliminating following by the female, the dorsal pricking behavior served to facilitate a switch from high aggression to high sexual motivation in the male. This behavior was apparently a motivation-adjusting mechanism. There also seemed to be a relationship between the display of certain nest activities and the adjustment in motivation in the male, (16 ref.)—G. Greenberg.

SENSORY PROCESSES

3888. Danielson, John T. (Brown U.) **Increment sensitivity in the visual system of *Limulus*.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 410.

3889. Fay, Richard R. (Connecticut Coll.) **Auditory sensitivity of the goldfish within the near acoustic field.** *U.S. Naval Submarine Medical Center Report*, 1969(Nov), No. 605, 11 p.—Investigated auditory sensitivity and discrimination of goldfish within the acoustic near field. Exp. I studied the effects of the near field on sound pressure thresholds. The sensitivity of Ss in terms of sound pressure appeared to vary with distance from the sound source. Exp. II studied stimulus generalization and frequency discrimination within the near field. A generalization gradient was observed which indicated that Ss can discriminate a frequency change as small as 12.5% without explicit differential training. Exp. III studied the effects of far field noise or near field thresholds. A masking effect was observed which appeared to be a negatively accelerated function of masker spectrum level. Exp. IV tested the ability of goldfish to localize a sound source within the near field. It was shown that Ss could discriminate between right 45° and left 45° stimulus directions. (19 ref.)—*Journal abstract*.

3890. Wasserman, Gerald S. & Patton, Danalee G. (U. Wisconsin) ***Limulus* visual threshold obtained from light-elecited unconditioned tail movements.** *Journal of Comparative & Physiological Psychology*(Oct), Vol. 73(1), 111-116.—Some naive horseshoe crab, *Limulus polyphemus*, reliably respond to sudden light onset with a downward tail movement. Not all Ss exhibit this response; the main determinant seems to be the general vigor of the S. The response is quite stable in Ss that exhibit it, and the response has been used to obtain the 1st absolute threshold from *Limulus* by means of the staircase method.—*Journal abstract*.

DEVELOPMENTAL PSYCHOLOGY

3891. Annett, Marian. (U. Hull, England) **The growth of manual preference and speed.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 545-558.—Examined hand preference, speed of movement of each hand, and vocabulary in 219 3½-15 yr. old children. The distributions of preference and relative manual speed were found unchanged during growth. Sex differences in preference and skill indicate that females are more asymmetrical to the right than males. Right-, mixed, and left-handers were found in binomial proportions in both sexes. A linear relation between degrees of preference and degrees of relative manual skill was demonstrated. The vocabulary distributions of right-, mixed, and left-handers differed; that of consistent left-handers was displaced upwards, that of mixed handers spread out to give a significant excess of mixed handers among those of lower IQ. Implications of findings for the basis of lateral asymmetry and for the relations between laterality and language development are considered. Norms for speed of movement in each hand are given which can be used to assess manual disability. (35 ref.)—*Journal abstract*.

3892. Caputo, Daniel V. & Mandell, Wallace. (Wakoff Research Center, Staten Island, N.Y.) **Consequence of low birth weight.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 363-383.—Examines the correlation of low birth weight (prematurity) with a number of deficits and debilities in development. Intellectual impairment, e.g., has been found to be significant for very low-birth-weight individuals, but not for those at the upper end of the low-birth-weight distribution. Low birth weight is relatively frequent in the histories of mental retardates, institutionalized individuals, and high school dropouts. Deviant behaviors, i.e., hyperkinesis, autism, and involvement in childhood accidents, appear to be relatively common among prematures, as are difficulties in language development, and in various areas of academic achievement. Physical growth, motor behavior, and neurological functioning are adversely affected as well. Minimal brain damage is presumed to mediate these sequelae. In turn, poor maternal nutrition, and inadequate prenatal care are viewed as causative of both low birth weight and of the attendant minimal brain damage. The difficulty of exercising proper control over potentially confounding variables is also discussed. (64 ref.)—*Journal abstract*.

3893. Goodman, Lisl M. (New School for Social Research) **Perceptual preferences in relation to aspects of personality.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 380-381.

3894. Hunt, K. W. (Florida State U.) **Syntactic maturity in school children and adults.** *Monographs of the Study for Research in Child Development*, 1970(Feb), Vol. 35(1), 67 p.—Results indicate increasing syntactic maturity with age, as was expected, and discusses the implications of these findings and their relation to current linguistic research.—A. Barclay.

3895. Irwin, Marc H. & McLaughlin, Donald H. (U. California, Berkeley) **Ability and preference in category sorting by Mano schoolchildren and adults.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 15-24.—Cards differing on color, form, and number were sorted by schoolchildren and adults of the Mano tribe of Liberia. Students were superior to adults, although adults were as good on a rice bowl sorting task

as the students on the card sorting task. All Ss were more able to sort cards by number and color than by form, and this effect was less for students in higher grades. Preference for dimensions, evidenced by order of choice in successive sorts, was 1st number, then color, then form. (17 ref.)—*Author abstract.*

3896. Krogman, W. (U. Pennsylvania) **Growth of head, face, trunk, and limbs in Philadelphia white and Negro children of elementary and high school age.** *Monographs of the Society for Research in Child Development*, 1970(May), Vol. 35(3), 80 p.—Reviews anthropometric findings from a population of white and Negro children.—A. Barclay.

3897. LaCrosse, E. Robert, et al. (Harvard U.) **The first six years of life: A report on current research and educational practice.** *Genetic Psychology Monographs*, 1970(Nov), Vol. 82(2), 161-266.—Summarizes a "state of the field" presentation to the Public Education Staff of the Ford Foundation. It reviews American literature and contemporary research projects dealing with children from birth to age 6. Topics covered are preschool education, preschool environments, social development and personality, physical development, language, attentional processes, curiosity, cognition, and measurement and assessment devices. Each of these areas is covered intensively from 1961-1967 with selected coverage of years prior to 1961. A bibliography of published work and ongoing projects (as of 1968) is included. (198 ref.)—*Author abstract.*

3898. Langer, Jonas. (U. California, Berkeley) **Theories of development.** New York, N.Y.: Holt, Rinehart, & Winston, 1969. xi, 191 p. \$5.95.—Combines the important theoretical ideas of developmental psychology into a description of the main contemporary approaches to development. 3 perspectives emerge: the psychoanalytic, the mechanical mirror, and the organic lamp. A brief presentation is included of the longitudinal empirical methods requisite to the investigation of progressive and regressive development.

3899. Phillis, Judith A. (U. Florida, Communication Sciences Lab.) **Children's judgments of personality on the basis of voice quality.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 411.—Investigated whether the responses of 240 elementary, junior high, and senior high students "to different voice types vary as a function of age." Ss were presented with 12 voices representing 3 voice types. Results indicate a significant age effect. It is concluded that "younger children are more sensitive to nonlinguistic vocal cues than are older children or adults."—G. Steele.

3900. Pratt, Robin W. (U. North Carolina, Greensboro) **Cognitive processing of uncertainty: Its effect on pupillary dilation and preference ratings.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 193-198.—The prediction of greater pupillary dilation as unpredictability (induced by random-turn shapes) increased was supported ($p < .001$) in studies involving 40 18-27 yr. old adults and 10 7-9 yr. old children. The postulated linearity of this increase found support, except in cases where apparent stimulus-selection strategies attenuated the dilation at higher levels of variability. Ss who did preference ratings concomitantly with the intake of visual unpredictability evidenced significantly greater dilation ($p < .001$) at the time of reporting the rating. Both children and adults dilated significantly less to the shapes after prolonged experience with similar stimuli, indicating development of either

ability to handle variability or to selectively filter input, but age was not a factor. The lack of any significant relationship between pupillary dilation and preference indicates the need for more definitive work in determining when these 2 indices profitably complement each other. Finally, adults dilated more to provocative auditory stimuli than to the visual shapes. (31 ref.)—*Journal abstract.*

INFANCY

3902. Carpenter, Genevieve C., Tecce, Joseph J., Stechler, Gerald, & Friedman, Steven. (Boston U., Medical Center) **Differential visual behavior to human and humanoid faces in early infancy.** *Merrill-Palmer Quarterly*, 1970(Jan), Vol. 16(1), 91-108.—From a sample of 18 normal full-term Negro females, findings indicate active regulation of visual input differentially related to the experimental stimuli; the observed discriminative visual behavior of infants in the 1st 2 mo. of life does not appear to be determined solely on the basis of stimulus properties but seems to reflect a more complex level of information processing, including associations from past experience with the stimulus object. (19 ref.)—R. V. Hamilton.

3903. Chachava, K. V. **Reoentsefalografiya ploda i novorozhdennogo.** [Rheoencephalography of the fetus and neonate.] Tbilisi, USSR: Ganatleba, 1969. 176 p.—Presents a monograph concerning data on the characteristics and dynamics of parturitional and postparturitional rheoencephalograms of babies born normally and anormally.—I. D. London.

3904. Cravioto, J., et al. **The ecology of growth and development in a Mexican preindustrial community: I. Method and findings from birth to one month of age.** *Monographs of the Society for Research in Child Development*, 1969, Vol. 34(4), 7 p.—Reports on the condition of all children, born during 1 yr., at birth, and on their physical and behavioral progress during the 1st mo. of postnatal life. A series of reports deriving from the longitudinal study of the children in this birth cohort are included. Also, presented is the general design of the study, and the methods used for the collection of data on the community, the children, and the families from which they derive.—A. Barclay.

3905. Friedlander, Bernard Z. (U. Wisconsin) **Receptive language development in infancy.** *Merrill-Palmer Quarterly*, 1970(Jan), Vol. 16(1), 7-51.—Presents an extensive review in 4 parts: (a) a brief review of some of the recently developed data on listening and receptive language functioning in babies, (b) a discussion of the rationale of infant receptive functions as a distinctive topic of research, (c) an examination of the reasons why it may be inappropriate to lump language perception in with other perceptual processes for which visual perception is usually the principal source of psychological models, and (d) an examination of a framework of interrelated psychological domains and organismic/environmental variables that seem to constitute the main nexus within which receptive language processes develop. (45 ref.)—R. V. Hamilton.

3906. McCall, Robert B. & Melson, William H. (Fels Research Inst., Yellow Springs, O.) **Complexity, con-**

tour, and area as determinants of attention in infants. *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 343-349.—Presented a series of 4 stimuli equated for contour length and area but varying in complexity as defined by the irregularity of the arrangement of elements within a pattern to 20 5-mo-old infant girls. No differences in 1st fixation or cardiac deceleration were observed as a function of complexity. A set of 4 stimuli controlled for complexity but varying in contour length and area was presented to a separate sample of 32 5-mo-old females. Attention was greater to forms possessing relatively more black area and to those having relatively short total black-white contour. Results support the need to refine the operational definition of complexity. (19 ref.)—*Journal abstract*.

3907. Mendel, Maurice I. (Central Inst. for the Deaf, St. Louis, Mo.) **Infant responses to recorded sounds.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 811-816.—Tested 30 4-11 mo. old infants with 5 different recorded sounds that varied in bandwidth and temporal configuration: a continuous band of white noise, the same band of noise interrupted twice/sec, the crinkling of onionskin paper, a narrow band of noise centered at 3000 Hz., and a warbled 3000-Hz tone. With loudness and duration of the stimuli held constant, more responses occurred to sounds composed of a broadband spectrum than to those of a limited bandwidth. Temporal configuration of the sound had no effect on the number of responses elicited.—*Journal abstract*.

3908. Rutter, Michael. (U. London, Inst. of Psychiatry, England) **Psychological development: Predictions from infancy.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1970(May), Vol. 11(1), 49-62.—Discusses the level of prediction which can be made from the age of 6 mo. Some estimate of whether or not there is psychological pathology may be made, although even here an appreciable minority of children will be misdiagnosed, but no useful predictions of psychological characteristics within the normal range can be made from early infancy. A consideration of the factors which influence development and the predictions of development leads to the view that, with better instruments, improved but still very modest predictions might become possible during later infancy, but it seems unlikely that any useful level of accuracy in psychological predictions (apart from a more accurate diagnosis of abnormality) will become possible by as early as 6 mo. (3 p. ref.)—*Journal summary*.

3909. Scarr, Sandra & Salapatek, Philip. (U. Pennsylvania) **Patterns of fear development during infancy.** *Merrill-Palmer Quarterly*, 1970(Jan), Vol. 16(1), 53-90.—The findings from 91 infants observed once, of which a 34-infant subsample was observed twice in bimonthly observations, generally indicated that: (a) to a large extent fear of strangers, fear of heights, and fears of the mechanical dog, jack-in-the-box, and loud noises develop independently; (b) the fear of masks shares some common variance with each of the foregoing fears; (c) there are no outstanding relationships between perceptual-cognitive ability as measured by specific fears; and (d) there are variations in temperament, and stable differences (over a 2-mo interval) in the pattern of fears displayed by individual infants, suggesting a possible genetic role in the development of fear during infancy. (63 ref.)—*R. V. Hamilton*.

3910. Schaffer, H. R. & Parry, M. H. (U. Strathclyde, Glasgow, Scotland) **The effects of short-term famil-**

iarization on infants' perceptual-motor co-ordination in a simultaneous discrimination situation. *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 559-569.—Attempted to demonstrate that around 6 mo. of age the infant's ability visually to categorize stimuli in terms of their familiarity-unfamiliarity is not yet associated with manipulative approach-avoidance responses and that such responses come under visual control only some time in the course of the 2nd ½ yr. of life. A short-term familiarization period was administered to 72 infants aged 5-7, 8-10, and 11-13 mo., followed by a simultaneous discrimination test involving the familiar and a novel stimulus. Results indicate that the ability visually to discriminate between the stimuli occurred at all 3 age levels, but that manipulative discrimination took place only in the 2 older groups. The effects on discrimination of some parameters defining the experimental procedure, i.e., the color of the familiarized stimulus and the nature of the familiarization condition (visual-tactual or visual-only), were also investigated.—*Journal abstract*.

3911. Siqueland, Einar R. & DeLucia, Clement A. (Brown U.) **Visual reinforcement of nonnutritive sucking in human infants.** *Science*, 1969(Sep), Vol. 165(3898), 1144-1146.—Studied high-amplitude sucking as a conditioned operant response reinforced by visual feedback in groups of 4- and 12-mo-old infants. Typical response acquisition and extinction effects were obtained. With the 12-mo-old Ss, the conditioned sucking rates were influenced by amounts of redundancy in the visual reinforcers.—*Journal abstract*.

CHILDHOOD

3912. Agarwal, M. C. & Srivatsava, D. N. (Agra Coll., India) **Role of meaningful distraction on performance with special reference to age and sex difference.** *Journal of Psychological Researches*, 1969, Vol. 13(1), 13-26.—Meaningful distraction introduced with the help of songs increased errors and caused poor performance. Sex differences were observed in 8th-class Ss.—*U. Pareek*.

3913. Arbib, M. & Kahn, Roy M. **A developmental model of information processing in the child.** *Perspectives in Biology & Medicine*, 1969(Spring), Vol. 12(3), 397-415.—Describes a cybernetic approach to normal childhood mental development, noting points of similarity and differences between a cybernetic brain and a physical brain. Differentiation of function in terms of hardware and software (programming) is outlined, and a model system of evolving brain function is diagrammed. Biological development, brain language, behavior language, and the nature of memory are described in outline cybernetic terms. Analogies to Piaget's work are pointed out.—*Author abstract*.

3914. Baldwin, William R. (504 Meadow View Rd., Forest Grove, Ore.) **Optometry: Child development and educability.** *Journal of the American Optometric Association*, 1969(Feb), Vol. 40(2), 131-133.—Presents recommendations from the American Optometric Association's Committee on Research concerning the role of optometric guidance in the visual development of children. Recommendations concern scientific method, evaluation of clinical procedures, closing the gap between researchers and practitioners, reporting new clinical information, developing improved educational

programs, and broadening financial support.—P. McMillan.

3915. Beussee, Mary P., Hammes, John A., & Ahearn, Thomas R. (U. Georgia) **Child care in the community fallout shelter.** *Psychology*, 1970(Aug), Vol. 7(3), 2-6.—The Civil Defense Research Staff at the University of Georgia conducted a 1-wk simulated fallout shelter occupancy test under austere conditions with a group of 7-12 yr. old elementary schoolchildren and 2 adults. Stress conditions included restricted food and water rations, minimal living space (6 sq. ft./person), chemical commodes, absence of furniture and bedding, and minimal recreational supplies (pencils and paper). Water intake averaged 1 qt/person/day and food consumption averaged 848 calories/person/day. The results of this test, together with implications for community fallout shelter child care, are discussed.—J. A. Blazer.

3916. Carr, Gordon L. (Syracuse U.) **The effects of self-blame and other-blame instructions on frustrative non-reward with children as subjects.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 408.

3917. Chauhan, N. S. & Tiwari, G. P. (Agra Coll., India) **Psycho-physiological sensitivity as a function of sex.** *Psychological Studies*, 1969, Vol. 14 (1), 39-46.—Girls were found to have significantly better psychophysiological sensitivity in areas of tactual stimulus limen, choice RT, and intelligence, whereas boys exceeded girls significantly in sensorial RT and muscular capacity. No difference was observed in pneumatic inspiration.—U. Pareek.

3920. Magowan, S. A. & Lee, Terrence. (Child Guidance Centre, Dundee, Scotland) **Some sources of error in the use of the projective method for the measurement of moral judgment.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 535-543.—Found that scores on a test of projective facility are associated with maturity of moral judgment. 56 9-12 yr. old children were formed into 2 x 2 groups by age and sex and matched on projective facility. Each S completed 12 stories and the number of immanent justice responses was used as a measure of moral maturity. The main independent variable was type of story, 1/2 depicting familiar situations and 1/2 originating from foreign cultures. Multiple-choice vs. open-ended forms and the sex of the central figure in the story were also systematically varied. All 3 story variables gave significantly different measures of moral maturity. Of the S variables, age was significant but sex showed no difference. It is concluded that the projective method is liable to serious imperfections and more stringent controls are urged for its future use. (29 ref.)—*Journal abstract.*

3923. Stouwie, Roger J., Hetherington, E. Mavis, & Parke, Ross D. (U. Texas) **Some determinants of children's self-reward behavior after exposure to discrepant reward criteria.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 313-319.—Investigated the effects of children's achievement orientations, sex of child, and sex of model on children's self-reward behavior. Achievement orientation was determined by performance on the Embedded Figures Test; 156 3rd and 4th graders then participated with an adult model in a bowling-game situation, during which the model used a low score as a criterion for self-reward while imposing a higher criterion on the child. High-achievement-oriented girls set the highest self-reward standards, regardless of sex of the model. Both male and female Ss who had interacted with female models took fewer rewards than those who had played with male models. A control group that was not exposed to models took markedly more rewards than did the Ss. (23 ref.)—*Journal abstract.*

3926. Belland, John C. (Syracuse U.) **Generalization of aural and visual nonverbal stimuli in a concept-association task.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5276-5277.

3927. Berry, Franklin M. & Baumeister, Alfred A. (U. Alabama) **Partial redundancy and cue selection.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 171-173.—Taught 40 3rd-6th graders either easy or hard paired-associates with or without partially relevant colored backgrounds. The partially redundant conditions produced more confusion errors at either level of trigram difficulty. Ss apparently utilized the colors for response evocation even though such a strategy could not lead to total-list learning.—*Journal abstract.*

3928. Garner, John. (U. Lancaster, England) **Age differences in the discrimination shift learning of young children.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1970(May), Vol. 11(1), 29-36.—Examined H. H. Kendler's hypothesis that the nature of discrimination learning changes in 4-6 yr. old children. Results indicate that within the experimental paradigm used by T. S. Kendler, H. H. Kendler, and D. Wells there are no differences with age in the relative ease of nonreversal and reversal shifts, both age groups finding reversals to be easier. Age differences were found in the ease of learning both types of shift, the explanation of which was unclear in the experiment.—*Journal summary.*

3929. Goldhaber, Dale E. (Syracuse U.) **The influence of age and pretraining on a discrimination reversal problem having one relevant and two irrelevant dimensions.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 380.

3930. Iversen, Iver A., Silberberg, Norman E., & Silberberg, Margaret C. (Kenny Rehabilitation Inst., Minneapolis, Minn.) **Sex differences in knowledge of letter and number names in kindergarten.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 79-85.—A study

of the learning of letter and number names in 59 boys and 51 girls prior to the onset of formal instruction in kindergarten indicated that there are sex differences not only in the rate of learning but in the components of learning. There is a tendency, reported earlier by A. Gates, for all children to either know the names of most letters and numbers or know only a few. Further, boys had learned their number names at least as well as girls while girls knew significantly more letter names than did boys. Findings exemplify the importance of developmental factors in learning to read which should be taken into account in the teaching of beginning reading.—*Journal abstract.*

the preschool years. *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5304-5305.

3940. Vezin, Jean F. (Faculté des Lettres et Sciences Humaines, Sorbonne, France) **Procédés de démonstration chez des enfants de dix à douze ans.** [Demonstration procedures for children, ten to twelve years old.] *Journal de Psychologie Normale et Pathologique*, 1970(Jan), Vol. 67(1), 71-87.—Compared the role in learning of different symbols in the expression of their relationships and transformations—learning from one method of demonstration. 10-12 yr. old boys and girls in a Paris school served as Ss. It was found that a figurative or schematic symbolization favors assimilation in depth. Although figurative symbolism is very related to learning data, the mastery of transfer is related to a lesser extent. However, there are 2 positive outcomes of figurative symbolism: it is concise and permits an immediate view of a group of relationships and their transformations, and it makes a bond between the concrete and the abstract. In contrast, verbal symbolism was not as effective, for it was too abstract for children of this age.—L. A. Ostlund.

Concepts & Language

3941. Aaron, P. G. **Two studies on concept development and their curricular implications.** *NIE Journal*, 1969, Vol. 3(3), 28-33.—A study of time- and space-related concepts of 503 72-136 mo. old boys showed that there was a general progress in the concept development with CA. The development of the knowledge of "yesterday" preceded that of "today" which was followed by the "tomorrow" concept. "Week" was understood better than "month" which was better understood than "year." Children understood their age and father's age more than mother's age. While 36% of the 6 yr. olds could talk about "feet" and "yards" only 4% of them could apply them. Similar trends were observed with reference to size and distance. Implications of these findings for curriculum development are stressed.—U. Pareek.

3942. Berzonsky, Michael D. (Edinboro State Coll.) **Effects of probing children's phenomenistic explanations of cause and effect.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 407.—"Investigates the influence of the testing procedure" on the causal explanations of 84 middle-class 1st graders. Ss were administered 3 Piagetian-type verbal measures of causality. Results indicate significantly "more phenomenistic explanations... with the nonprobed condition than with the probed treatment" and a significant Treatment \times Measures interaction.—G. Steele.

3943. De Vries, R. (U. Chicago) **Constancy of generic identity in the years three to six.** *Monographs of the Society for Research in Child Development*, 1969, Vol. 34(3), 56-60.—Reports on "constancy of generic identity, the belief that the identity of a living being is invariant. In order to investigate whether this aspect of the child's reality could be demonstrated to be different from that of the adult, a black cat named Maynard was trained to wear a rabbit mask and a ferocious dog mask. 3 major aims of the study can be cited: (a) to extend Piaget's notions about constancy of identity, (b) to investigate the cognitive implications of the relation between verbal and emotional reactions, and (c) to bring evidence to bear on several possible interpretations of this inconstancy phenomenon."—A. Barclay.

3944. Farnham-Diggory, S. (Carnegie-Mellon U.) **Cognitive synthesis in Negro and white children.** *Monographs of the Society for Research in Child Development*, 1970(Mar), Vol. 35(2), 84 p.—Explored symbolic abilities, and their development, with a view toward the technology of pedagogy. It was found that racial differences in symbolic abilities, while present, might be remediable through various cognitive training techniques.—A. Barclay.

3945. Giebnek, John W., Neville, Annette, & Davidson, Robert E. **Acquisition of morphological rules and usage as a function of social experience.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 217-221.—60 preschoolchildren were used to test the hypothesis that social class membership effects grammatical usage. It is concluded that when a relatively specific test of standard English grammar is used, the 2 social class groups can be differentiated beyond that which occurs on the basis of intelligence alone.—H. Kaczowski.

3946. Goda, Sidney. (United Hosp., Port Chester, N.Y.) **Speech development in children.** *American Journal of Nursing*, 1970(Feb), Vol. 70(2), 276-278.—Distinguishes 5 stages of prelinguistic speech development: (a) isolated sounds, (b) syllabic utterances, (c) awareness of one's own sounds, (d) echolalia, and (e) acquisition of several meaningful words. The last stage (age 12-15 mo.) normally parallels motor development (walking). A child who begins to walk at 15 mo. should be uttering meaningful words by age 2. The average number of words in a normal child's response should be equal to CA, whereas it should be equal to MA in the retarded child. Intelligibility is another factor for speech evaluation. The speech of a child after the 1st grade should be completely intelligible. Several types of speech deviations are discussed, and the need for early treatment is emphasized.—B. A. Stanton.

3947. Halford, Graeme S. (U. Newcastle, New South Wales, Australia) **A classification learning set which is a possible model for conservation of quantity.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 11-19.—Analyzed conservation of quantity as a classification task. Quantities were classified according to height and breadth into a 2-dimensional classificatory system which corresponds to the operation of logical multiplication of heights and breadths. It is also a system in which all Ss' judgments, perceptual and cognitive, are brought into consistent relationships. The system was taught by training Ss to recognize correspondences between equivalent categories of quantities in different sets of material. Learning set training consisting of 14 problems over 7 sessions was given to 15 preschool children, to 15 nonconservation children over 5 yr. and to 15 conservation children. All Ss over 5 yr. showed improvement over problems. Preschool Ss did not. The experiment is interpreted as showing that preschool Ss cannot construct the logical basis of conservation, whereas Ss over 5 show some ability to do so. (16 ref.)—*Journal abstract.*

3948. Janes, Helen E. (Indiana U.) **Conceptual modes of children in responding to art objects.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 224.

3949. Nezvadovitz, Enrique & Pomares, Ana. (U. Havana, Cuba) **Sobre la adquisición de algunas operaciones intelectuales en niños cubanos.** [On the acquisition of some mental operations by Cuban children.] *Psicología y Educación*, 1968(Jan), Vol. 5(10),

3-13.—Describes the application of Piaget's "ball of clay" test to 2 groups of 7-yr-old Cuban schoolchildren. Group A was a control, having been taught mathematics by the traditional method; Group B had been taught by the Cuisinaire method. A 3rd group with learning difficulties was also tested. Results of 20 Ss from Groups A and B were compared with those cited by Piaget in regard to Ss' concepts of the conservation of substance (S), weight (W), and volume (V). Piaget's Ss showed a decreasing relation between S, W, and V, while Groups A and B showed a greater conservation of V. A comparison of Groups A and B favored Group B which showed better concepts of conservation. Tests of Ss with learning difficulties revealed a lack of conservation concepts which demonstrated the diagnostic value of a conservation test. The Cuisinaire method was thought to produce operationally superior results. Cases of total inversion are discussed. (English & French summaries)—P. Hertzberg.

3950. Piaget, Jean. (U. Geneva, Switzerland) **Quantification, conservation, and nativism.** *Science*, 1968(Nov), Vol. 162(3857), 976-979.—Reviews a study of cognitive capacities of young children, 2½ yr. and older, made by J. Mehler and T. G. Bever (see PA, Vol. 42:570). Additional experimental data were obtained as part of an evaluation of conclusions reached concerning the development of quantitative concepts. 29 2.3-3.1 yr. olds were interviewed with Mehler and Bever's displays of "2 rows of 4 or 6 elements in optical correspondence." It is concluded that the Mehler and Bever argument for an "innate structure" is superfluous and not justified, and that "innate functioning is sufficient."—P. McMillan.

3951. Rayburn, Carole A. (Catholic U. of America) **Socioeconomic and ethnic variables in concept formation of late childhood.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 468.

3952. Rosenthal, Ted L., Zimmerman, Barry J., & Durning, Kathleen. (U. Arizona) **Observationally induced changes in children's interrogative classes.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 681-688.—Studied a model's influence on the information seeking of 140 culturally disadvantaged 6th grade children in 4 variations. Separate groups observed 12 diverse instances within alternative question classifications based on nominal or physical stimulus attributes, functional stimulus uses, causal relationships regarding stimuli, and judgments of value or preference concerning stimuli; pictorial stimuli that varied in content, color, and number across trials were used to prevent response stereotypy. No extrinsic reward was offered. By reference to base-line responding, significant imitation of all question classes was found, and all question classes were generalized to a new set of stimulus pictures. (17 ref.)—*Journal abstract.*

3953. Savitsky, Jeffrey C. & Izard, Carroll E. (Vanderbilt U.) **Developmental changes in the use of emotion cues in a concept-formation task.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 350-357.—50 white middle-class 4-8 yr. olds chose the 2 most similar photographs of human faces from each of 96 groups of 3. It was prearranged so that 2 of the 3 photographs would contain either the common element of hats or facial expressions of emotion. Results show that there was a significant increase with age in the use of hats and facial expressions as the basis of pairing when these were the only prearranged common elements in a

given triad. There was no difference between these methods of pairing, indicating that the use of either kind of common element offered no greater difficulty than the other. However, when Ss had to choose between pairing photographs with either hats or expressions within a given triad, 4-yr-old Ss paired most frequently using hats while older Ss used emotional expressions. Also, there were found to be significant differences in the number of pairings depending on which emotion was displayed in the photographs.—*Journal abstract.*

3954. Shepard, Winifred O. (State University Coll. New York, Fredonia) **Word association and definition in middle childhood.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 412.—Investigated whether "school pressure for mature verbal behavior... would cause internal associative hierarchies to shift from syntagmatic to paradigmatic and would result in a correlation between syntagmatic associations and functional definitions" with 49 4th, 40 6th, and 48 8th graders. Ss were white and predominantly middle class. Single written word associations and their definitions were obtained. Results indicate significant grade and sex effects and Grade \times Sex interaction.—*G. Steele.*

3955. Sherman, Dorothy & Silverman, Franklin H. (U. Iowa) **Three psychological scaling methods applied to language development.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 837-841.—Compares several psychological scaling methods for usefulness in measuring language development displayed in samples of children's speech with reference to intricacy of language usage. Os rated typed samples of speech, 1 for each of 50 children, by the method of equal-appearing intervals and by the method of direct magnitude-estimation. Both equal-appearing-intervals median scale values and successive-intervals scale values were derived from the equal-appearing-intervals ratings. The 2 sets of scale values obtained from the same data by the methods of equal-appearing intervals and of successive intervals are closely related ($r = .995$). The direct-magnitude-estimation scale values also are closely related to the equal-appearing-intervals scale values ($r = .92$).—*Journal abstract.*

3956. Shriner, Thomas H. & Miner, Lynn. (U. Illinois, Champaign) **Morphological structures in the language of disadvantaged and advantaged children.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 605-610.—Compared 25 culturally disadvantaged and 25 culturally advantaged preschool children, matched by MA, in their ability to apply morphological rules to unfamiliar situations. A comparison of morphology scores revealed no statistically significant difference. Several hypotheses are advanced to account for the lack of significant differences between the 2 groups. It is suggested that when relevant variables are controlled, and with respect to the morphological language abilities measured in this study, the labels "culturally disadvantaged" and "culturally advantaged" may be misnomers.—*Journal abstract.*

3957. Teasdale, G. R. & Katz, F. M. (U. New England, Armidale, New South Wales, Australia) **Psycholinguistic abilities of children from different ethnic and socio-economic backgrounds.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 155-159.—Compared 59 1st grade children of different socioeconomic status (SES) and different ethnic background on 2 tests of language ability: the Peabody Picture Vocabulary Test (PPVT) and the Illinois Test of

Psycholinguistic Abilities (ITPA). On these tests, lower SES and part-Aboriginal Ss performed at a significantly lower level than upper SES Ss. Utilizing ITPA subtest scores, it is evident that this significant difference was the result of low achievement on subtests measuring the auditory and/or vocal components of psycholinguistic ability. On subtests measuring visual and/or motor components differences between the groups were minimal. Results support the contention that familial experiences differentially affect language skills.—*Journal abstract.*

Abilities

3958. Anandalakshmy, Subrahmanyam. (U. Wisconsin) **Effects of instructional intervention on performance of second grade children in a categorization game.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 208.

3959. Brown, Janet L. (James Jackson Putnam Children's Center, Boston, Mass.) **Precursors of intelligence and creativity: A longitudinal study of one child's development.** *Merrill-Palmer Quarterly*, 1970(Jan), Vol. 16(1), 117-137.—Felicia, 1 of 6 children in a longitudinal study, was observed from birth to 8 yr. She demonstrated unusual artistic ability and superior intelligence, and emotional factors which were precursors of her creativity. The case study emphasized her capacity for depth and focus of attention, unusual visual awareness, inner-directedness, good fine motor coordination, and humor, characteristics that find support in the literature on older gifted children and adults. (28 ref.).—*R. V. Hamilton.*

3963. Nuttall, Ena V. (Boston U., School of Education) **Creativity in boys: A study of the influence of social background, educational achievement, and parental attitudes on the creative behavior of ten year old boys.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 231-232.

3964. Reich, John W. (Arizona State U.) **Prediction of motor performance from childhood history.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 10.—Presents data supporting prior research by J. W. Reich (see PA, Vol. 43:7798) which demonstrated significant correlations between past history and laboratory behavior, and extends that work to the area of motor performance. Based on results from a 51-item questionnaire assessing cognitive, motor, and cognitive-motor dimensions, it was found that motor experience in childhood correlates significantly with motor (pursuit rotor) performance in 44 Ss, and that the relationship is independent of cognitive factors. Results support attempts to predict laboratory behavior from previous nonlaboratory experiences.—*Author abstract.*

3965. Smith, Harry S. (U. Virginia) **An inquiry into**

the reliability and validity of certain psychomotor tasks. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 237-238.

3966. Starnes, David R. (8001 Burnet Rd., Austin, Tex.) **Visual abilities vs. reading abilities.** *Journal of the American Optometric Association*, 1969(Jun), Vol. 40(6), 596-600.—Reports a pilot study investigating the relationship between reading difficulties and certain visual-perceptual abilities. Ss were 18 3rd grade children divided into 2 groups, (8 good and 10 poor readers, as based on the Metropolitan Achievement Test). Ss were tested with a group of visual abilities tests, including form perception, hand-eye coordination, visual efficiency, and directional orientation. Results suggest no relationship between a single visual ability and a single perceptual ability. It is concluded that these functions are complex and interrelated. Implications of these findings for practicing optometrists are reviewed.—*P. McMillan*.

3967. Waddell, Kathleen J. & Caboon, Delwin D. (U. Montana) **Comments on the use of the Illinois Test of Psycholinguistic Abilities with culturally deprived children in the rural South.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 56-58.—Examined evidence of item content bias in the Illinois Test of Psycholinguistic Abilities. The instrument fails, in certain subtests, to relate to the basic communication skills of Headstart children in the rural South. Incautious application of the test to minority groups may not yield adequate functional assessment of these children's skills. It is recommended that alternative scoring procedures, local norms, or new items be developed.—*Journal abstract*.

3968. Willard, Louisa S. **A comparison of Culture Fair Test scores with group and individual intelligence test scores of disadvantaged Negro children.** *Journal of Learning Disabilities*, 1968(Oct), Vol. 1(10), 584-589.—Comparison of responses of 89 6th grade Negro Ss on the Cattell Culture Fair Intelligence (CCFI) Test and the Academic Promise Tests (APT) shows that Ss' WISC IQ, estimated from the total score on the APT, is only, on the average, 3 points lower than on the Cattell. When 83 other Negro Ss, from special classes for the mentally retarded were compared on the Stanford-Binet Intelligence Scale and the CCFI Test, the mean score on the CCFI Test was 1.9 higher than on the Stanford-Binet. Results suggest that: (a) Negro children are not at any appreciable disadvantage in taking the APT or the Stanford-Binet in preference to the CCFI Test, (b) the APT are a more effective measure for predicting school achievement and lend themselves to more effective qualitative analysis than the CCFI Test, and (c) nonverbal IQ is of no major advantage in the school situation. It is concluded that the bright Negro child does well on either a culture fair or the usual ability and intelligence tests, while those who are less well endowed do poorly on either type.—*M. Maney*.

Perception

3969. Allen, Robert M. (U. Miami) **The PPVT is not a test of visual perceptual maturation.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 262.—Criticizes R. Beck and L. W. Talkington's use of the Peabody Picture Vocabulary Test as a validity-criterion for measuring the degree of improvement due to exposure to the Frostig-Horne visual training materials.—*Author abstract*.

3970. Barabasz, Arreed F., Dodd, John M., Smith,

Manon, & Carter, Donald E. (State University Coll. New York, Buffalo) **Focal-point dependency in inversion perception among Negro, urban Caucasian and rural Caucasian children.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 136-138.—21 deprived Negro, 41 deprived rural Caucasian and 23 nondeprived Caucasian preschool children viewed 12 figure pairs and indicated which figure of each pair was upside down. Analysis of variance results demonstrate significant differences in focal-point dependency between nondeprived urban Caucasians and deprived urban Negroes, and between deprived urban Negroes and deprived rural Caucasians. No significant differences were found between nondeprived urban Caucasians and deprived rural Caucasians.—*Journal abstract*.

3971. DeLeon, J. L., Rasking, L. M., & Gruen, G. E. (Purdue U.) **Sensory-modality effects on shape perception in preschool children.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 358-362.—Investigated the relative roles of touch and vision in the shape perception of 24 3- and 24 4-yr-old children. Also shape perception based on the integrated use of both touch and vision was studied. Visual discrimination alone was superior to tactual discrimination alone in discriminating random forms. The integrated use of both touch and vision in shape discrimination resulted in no better performance than that with vision alone. An exploratory condition did suggest that visual exploration of a standard stimulus enhanced tactual discrimination. However, this condition always occurred last and, thus, is difficult to interpret because of practice effects.—*Journal abstract*.

3972. Garloff, David A. (Indiana U.) **The effect of vertical viewing height and background cues on the recognition of realistic pictures for various aged children.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 218-219.

3973. Girgus, Joan S. (New School for Social Research) **A developmental study of the recognition of sequentially presented forms.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 413.

3974. Palow, William P. (U. Florida) **A study of the ability of public school students to visualize particular perspectives of selected solid figures.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 78-79.

3975. Rosner, Jerome. **A rationale for a perceptual development program.** *Journal of the American Optometric Association*, 1969(Feb), Vol. 40(2), 144-149.—Discusses methods for utilizing the child's existing performance base in a program of perceptual development. Concepts of Piaget are used as a framework for discussion. A perceptual development program should be geared to the child's readiness to operate at each stage in the developmental sequence. The overall goal is "to assist the child in developing the ability to organize and operate efficiently within a greater and more complex spatial volume." (24 ref.)—*P. McMillan*.

3976. Solso, Robert L. (Loyola U., Chicago, Ill.) **Stimulus selection by five-, seven-, and nine-year-old children.** *American Journal of Psychology*, 1970(Jun), Vol. 83(2), 216-221.—Examined functional stimulus selection by 5-, 7-, and 9-yr-old Ss (N = 180) in a paired-associate learning and recall test. The compound stimuli were of 2 classes—geometric figures and colors—and the responses were pictures of common objects. Ss seemed to select the geometric figures as

functional stimuli. Several alternative hypotheses are offered to account for the results, among them a hypothesis of stimulus-habit hierarchy and a hypothesis of alternating stimulus selection.—*Journal abstract.*

Personality

3977. Evans, James R. (George Peabody Coll for Teachers) **Relationships of psychological differentiation, emotional distance from reinforcing agent, emotional arousal, and responsiveness to social reinforcement.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 411-412.

3978. Gramza, Anthony F. (U. Illinois, Children's Research Center) **Preferences of preschool children for enterable play boxes.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 177-178.—Obtained measurements of 36 4-yr-old children's preferences for enterable play boxes having various degrees of openness. In their use of boxes, Ss strongly favored those boxes having least degrees of openness and greatest amounts of encapsulation. Consideration is given to stimulus factors possibly reinforcing the observed preferences.—*Journal abstract.*

3979. Kopfsstein, Joan H. (Georgia State U.) **Social desirability, expectancy, and success-failure-oriented behavior in children.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 428.—Investigated success-failure-oriented behavior of children with high and low social desirability (SD) characteristics. It was expected that high SD Ss would give overly cautious bids and would adopt a failure avoiding pattern on J. B. Rotter's level of aspiration task. Results from 87 8-13 yr. old boys in either normal public school, day school, or residential centers for the disturbed support the hypothesis. Of Ss receiving the Epstein Need of Approval scale of SD, nondisturbed Ss had significantly higher scores than disturbed Ss, indicating a stronger SD tendency for nondisturbed Ss.

3980. Loch, Wolfgang. **Zur Entstehung aggressiv-destruktiver Reaktionsbereitschaft.** [On the genesis of the readiness to respond aggressively-destructively.] *Psyche, Stuttgart*, 1970(Apr), Vol. 24(4), 241-259.—The decisive factor responsible for development of aggressive-destructive patterns of reaction is the long period of dependency of the human child with its protracted inequality of power which makes virtually unavoidable envy, hate, and destructive impulses. These could be mitigated if the powerful "significant others" were content to exert their influence in the service of the child's growth and autonomy alone. (61 ref.)—*English summary.*

3981. McConville, B. J., Bong, I. C., & Purohit, A. P. (Queen's U. Kingston, Ontario, Canada) **Mourning processes in children of varying ages.** *Canadian Psychiatric Association Journal*, 1970(Jun), Vol. 15(3), 253-255.—Investigated qualitative and quantitative aspects of mourning in children who were residents of an institution whose director and chief psychologist had recently died in a fire. 9 5-8 yr. old and 10 9-12 yr. old Ss were interviewed 10 days-2 wk. after the deaths, followed by 2nd interviews 8 wk. later. Results show age and developmental differences in responding to grief, with younger Ss displaying more egocentricity, aggression, denial, preoccupation with the dead, and testitive dreams, and older Ss displaying more concern for others. Number of previous placements did not seem to affect the mourning pattern. Also impressive was the speed

with which Ss recovered from this traumatic event as reflected in their 2nd interview behavior. (French summary)—*P. McMillan.*

3982. Reall, Norma. (Syracuse U.) **The effect of success and failure on the reflective and impulsive child.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5299-5300.

3983. Reall, Norma & Hall, Vernon. (Boston U.) **Effect of success and failure on the reflective and impulsive child.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 392-402.—Administered 56 reflective and 56 impulsive 3rd grade boys a modified version of the Delay of Recall Test to assess the effect of success and failure on decision time and expectancy of success under varying conditions of imposed success and failure. The analysis of the expectancy of success measures showed that impulsive Ss reacted the same way to success and failure experiences as did reflective Ss, i.e., raising expectancy of success after success, lowering it after failure. Decision time measures indicated, however, that despite the conditions imposed, reflective Ss took longer to make decisions than their impulsive counterparts.—*Journal abstract.*

Social Behavior

3984. Ford, LeRoy H. (State U. New York, Buffalo) **A social desirability questionnaire for young children.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 195-204.—The Young Children's Social Desirability Scale based on the MMPI I. scale model was constructed and administered to 437 nursery school children. Split-half reliabilities were substantial for children over 4 and moderate for those under 4; test-retest reliabilities were moderate for children over 4 and mixed for those under 4. Social desirability scores increased with age, showed a low positive relationship to picture vocabulary IQ, and were unrelated to sex in a high socioeconomic sample, but were higher for girls in a more general sample. 3 construct validation studies are summarized which indicate that children who score high on the scale are more motivated than low scorers to respond positively to interpersonal demands. (23 ref.)—*Journal abstract.*

3985. Gentry, William D. (Duke U. Medical Center) **Effect of time-out from positive reinforcement on aggressive behavior in young children.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 283-288.—Explored the effect of time-out from positive reinforcement on aggressive behavior in 16 5 yr. olds. Instrumental aggressive and nonaggressive doll-play were observed prior to and immediately following time-out from CRF token reinforcement. Results indicate that, while time-out from positive reinforcement was not an effective antecedent of aggressive behavior for children in general, it did produce a notable increase in the over-all activity level of females. The fact that girls, and not boys, were aroused by the time-out procedure was discussed in terms of the relationship between activity-related cue properties of the doll-play apparatus and the normal activity of 5-yr-old girls. (19 ref.)—*Journal abstract.*

3986. Hodgkins, Betty J. (Florida State U.) **Pre-adolescent awareness of clothing and appearance as related to age and sex.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 494.

3987. Hrab, Joseph & Grant, Geoffrey. (Iowa State U.) **Black is beautiful: A reexamination of racial**

preference and identification. *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 398-402. —Duplicated the 1939 K. B. Clark and K. M. Clark doll study in an interracial setting with 89 Negro and 71 white 4-8 yr. old Ss. Unlike the previous study, it was found that the majority of the black Ss preferred the black dolls. Like the blacks, the majority of the white Ss preferred the doll of their own race. The racial identifications of both black and white Ss are reported, and the effects of age and skin color on racial preference and identification are compared with those reported by Clark and Clark. A control for the race of interviewers showed that this variable did not have a significant effect upon the dependent variable. The correspondence between doll choice and friendship was ambiguous. (21 ref.) —*Journal abstract.*

1988. Lepper, Mark R. (Yale U.). **Anxiety and experimenter valence as determinants of social reinforcer effectiveness.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 704-709. —Assessed the interactive effects of E valence and the S's anxiety level on social reinforcer effectiveness in a 2 x 2 (High-Low Anxiety x Positive-Negative Valence) design. 40 preschool Ss experienced a 10-min positive or negative interaction with E 1. 1 wk. later, the S's anxiety level was independently manipulated by films shown to the S by E 2; and immediately following these films, S was tested on a social reinforcement task by E 1. 20 control Ss were tested without prior contact with E 1. Results from both rate-change ($p < .001$) and persistence ($p < .10$) measures of reinforcer effectiveness demonstrate the predicted interaction. Under high anxiety, the negative E was more effective than the positive, while under low anxiety, the positive E was the more effective. Results are explained in terms of the S's active compliance, and other data relevant to this analysis are discussed. (16 ref.) —*Journal abstract.*

1989. Leventhal, Richard B. (Indiana U.). **The treatment of more and less differentiated social rejectees.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 155-156.

1990. Lindskold, Svenn; Cullen, Phyllis; Galagan, James, & Tedeschi, James T. (Ohio U.). **Developmental aspects of reaction to positive inducements.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 277-284. —Modified the Prisoner's Dilemma game so that 72 male and 72 female 5th and 6th graders played a simulated player who communicated occasional promises of a extra reward if the cooperative choice was made on the next trial. Ss were assigned to promise credibility conditions of 10, 50, and 90% reward levels of \$5, \$10, and \$20, and simulated strategies which were either 50 or 90% cooperative over the 100 trials. There was less compliance to the promise when it was only 10% credible, compliance was greater when the \$20 reward was offered. Ss were more cooperative overall when the simulated player was 90% cooperative. Males were more cooperative than females, especially when the simulated player was 90% cooperative. The development of moral considerations and the capacity to take the other's viewpoint, as proposed by Piaget, were suggested to explain the results when no such effects had been found in a previous study using adult Ss who uniformly reciprocated the simulated player's helpfulness. The S's behavioral sensitivity to variation in reward probability and magnitude were consistent with H. A. Witkin's conclusions regarding the field dependence of children. (17 ref.) —*Journal abstract.*

1991. Meltzer, Carol G. (U. Wisconsin). **The effects of age, race of victim, and ability to take another's role in helpfulness and sharing in children.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 399-400.

1992. Messer, Stanley B., Kagan, Jerome, & McCall, Robert B. (Rutgers State U.). **Psychological Clinic) Fixation time and tempo of play in infants.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 406. —Alternately presented 24 white lower-class and 24 white middle-class 13-mo-old infants slides of 3 human faces and 3 objects for 15 sec. and a rest interval of equal length. An index of habituation was derived and "correlated with the number of act changes displayed during the free play session for each sex by class group." Results indicate sex and class differences. —G. Steele.

1993. Rickard, Henry C., Ellis, Norman R., Barnhart, Sharon, & Holt, Michael. (U. Alabama). **Subject-model sexual status and verbal imitative performance in kindergarten children.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 405. —Examined the performance of 10 white middle-class kindergartners on a word modeling task in an attempt to determine possible personality correlates. Results indicate "a significant trials effect" for all groups but "no significant effects due to sex of model, sex of S, or their interaction." A replication controlling for effects of sex of 1 and model indicate only a significant trials effect. —G. Steele.

1994. Schneider, Frank W. (U. Windsor, Ontario, Canada). **Conforming behavior of black and white children.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 466-471. —Used the R. S. Crutchfield technique to measure the conforming behavior of 48 black and 48 white junior high school children. Whites conformed less to black peers than to white peers, whereas the conformity of blacks was not differentially influenced by the ethnicity of the source of influence. Whites conformed more to their own ethnic group than blacks conformed to their own ethnic group, with the difference largely attributable to the magnitude of the white females conformity. There was no strong evidence for a relationship between ethnic attitudes and overt behavior. The failure to support experimental predictions based on findings from studies employing undergraduates is noted. (17 ref.) —*Journal abstract.*

1995. Stenroos, Roger J. (U. Wisconsin). **The effects of inconsistent verbal instructions and experimenter personality characteristics upon children's resistance-to-temptation behavior.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 427.

Parent-Child & Family Relations

1986. Herrmann, T., Schellhauert, E., & Ahrens, H. J. (Inst. für Psychologie, U. Marburg, W. Germany). **Untersuchungen zum öffentlichen Erziehungsstil: Strenge und Unterstützung.** [Investigations concerning parental behavior: Severity and support.] *Archiv für die gesamte Psychologie*, 1966(Aug), Vol. 12(1), 54-105. —Presents theoretical considerations concerning dimensions of parental behaviors and attitudes and reports on empirical studies of parental child rearing practices as perceived by children. 2 independent scales were constructed hypothesizing a 2-dimensional model of reinforcement of parental child rearing behavior employing a questionnaire by U. Bronfenbrenner. These

scales, identified as "severity" and "support," were administered to 614 5th and 6th graders. Analyses of variance and discriminant analyses show associations between perceived parental severity and support, intelligence, sex, type of school, confession of faith of children, sex and socioeconomic status of their parents. Discriminant functions combining linearly severity and support discriminate children with respect to sex, confession of faith, and status. Results indicate that these 2 techniques of parental social reinforcement are not related to each other in a summative but in a subtractive way. This effect of the 2 described components of perceived parental behavior may be regarded as difference of reinforcement strength. (French summary) (51 ref.)—*English summary*.

3997. Schludermann, Eduard & Schludermann, Shirin. (U. Manitoba, Winnipeg, Canada) **Replicability of factors in children's report of parent behavior (CRPBI).** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 239-249.—Modified the Children's Reports of Parental Behavior Inventory (CRPBI) as developed by E. S. Schaefer, to make the inventory suitable for use in cross-cultural research. The inventory was administered 6 mo. apart to 2 independent samples of college students ($N = 294$ and 398). 3 factors were obtained across samples, sex groups and parent-forms. The factors replicated were the same as in Schaefer's studies.—*Author abstract*.

3998. Schludermann, Shirin & Schludermann, Edward. (U. Manitoba, Winnipeg, Canada) **A methodological note on conceptual frames of parental attitudes of fathers (PARI).** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 145-148.—Attempted to delineate the major dimensions underlying the reversed and unreversed forms of Father's form of the Parental Attitude Research Instrument (PARI). The 2 forms of the questionnaire were administered with an interval of 1 wk. to 269 college males. Factor analysis of 20×20 scale with an eigenvalue cut-off point of 2, yielded basically the 2 major dimensions previously obtained on Mother's form of the PARI.—*Author abstract*.

ADOLESCENCE

3999. Ikonnikova, S. N. & Lisovskii, V. T. **Molodězh o sebe, o svoikh sverstnikakh.** [Youth about himself and his peers.] Leningrad, USSR: Lenizdat, 1969. 132 p.—Analyzes the results of a social psychological investigation of the "public opinion, moods, life plans, and ideals of Soviet youth." "Life plans" are not equated with "vocational choice" alone, but are viewed more widely, including "goal and meaning of life, needs, and interests."—*I. D. London*.

4000. Jepson, Peter. (United States International U., San Diego, Calif.) **Some effects of self-actualizing growth psychology on teenagers.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 224-225.

4001. Libby, William L. (Ohio State U.) **Reaction time and remote association in talented male adolescents.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 285-297.—Found differences between good and poor remote associators on an irregular RT task in which a stimulus was preceded at various preparatory intervals by a warning. 32 high school students, mean age 14.9 yr. and mean IQ 130.7 served as Ss. These differences were related to a model of the remote

associational process postulating fluctuations of attention among 3 states: (a) attention to a broad range of environmental information, (b) focus on task-relevant external cues, and (c) attention inward. As predicted, good remote associators had more variable RTs and were more responsive to irrelevant cues provided by the previous preparatory interval. Differences between good and poor remote associators were traced to short and long preparatory intervals, respectively, suggesting that good remote associators, somewhat like schizophrenics, have difficulty establishing an initial set to respond quickly while poor remote associators have more difficulty maintaining an established set. (22 ref.)—*Journal abstract*.

4002. McBride, John W., Eisenman, Russell, & Platt, Jerome J. **Dependence, independence, symbiosis, and therapy.** *Psychology*, 1970(Aug), Vol. 7(3), 7-14.—Analyzes the dependence-independence conflict, with special emphasis on problems the adolescent faces in attempting to define a separate self, with relatively greater reliance on his own personal standards instead of those of his parents. Symbiotic ties with parents and other authority figures are seen as standing in the way of individualization. After an eclectic view of the interdependency struggle of adolescents, a case history of a student undergoing short-term therapy is presented. The dependence-independence issue is considered in therapy, and the patient's struggle toward greater independence is traced.—*J. A. Blazer*.

4003. Oscarson, Janice M. (Indiana U.) **A study of adjustment, body cathexis, perceived ideal body type, and objective body type in pre-, mid-, and post-pubescent girls.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 232.

4004. Steele, Carolyn I. (Smith Coll., School for Social Work) **Institutional placement during adolescence and its relationship to the girl's task of sexual identification.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 474-475.

4005. Wagner, Rudolph F. (Public Schools, Richmond, Va.) **Levels of symbolization in adolescent adjustment patterns.** *International Journal of Symbolology*, 1969(Aug), Vol. 1(1), 67-74.—A sample of adolescents representing 238 referred cases and 24 nonreferred cases in a school setting was analyzed for differences and characteristics regarding levels of symbolization. The Kahn Test of Symbol Arrangement was used for this purpose. Results isolated 17 categories of adjustment. Different types of students vary in their levels of symbolization according to their different maladjustive patterns.—*Journal summary*.

4006. Werdelin, Ingvar. (School of Education, Malmö, Sweden) **Factor analyses of an inventory of behavior in social situation.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(1), 54-64.—2 samples of 178 male and 238 female 9th graders answered a questionnaire dealing with nervous behavior in social situations. Factor analyses gave 5 factors in the study of boys and 4 in the study of girls. Rotation to a common structure showed at most 4 common congruent factors, which are interpreted and discussed.—*Journal abstract*.

4007. West, Lloyd W. (U. Calgary, Alberta, Canada) **Sex differences in the exercise of circumspection in self-disclosure among adolescents.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 226.—Administered L. W. West and H. W. Zingle's (see PA, Vol. 43:15015), a self-disclosure inventory for adolescents to 271 9th

graders. Indices of circumspection exercised by Ss in disclosing personal information to various confidants were obtained. It was found that girls exercised significantly greater circumspection with respect to confidants than did boys, but boys exercised significantly greater circumspection with respect to content of disclosure than did girls.—*Author abstract.*

4008. Kandel, Denise B. & Lesser, Gerald S. (Harvard U., Lab. of Human Development) **Parental and peer influences on educational plans of adolescents.** *American Sociological Review*, 1969(Apr), Vol. 34(2), 213-223.—The notion of a separate adolescent subculture totally isolated from parental influence is not supported by data on educational plans based on triads of adolescents matched with their mother and their best friend in school. It was found that concordance on educational goals is higher with mother than with best-school-friend and is not explained by the common social class which adolescents share with parents and friends. While concordance with friend increases with greater intimacy, concordance with mother remains at the same level, irrespective of the adolescent closeness to his parents. (38 ref.)—*Journal abstract.*

ADULTHOOD & OLD AGE

4009. Buhler, Charlotte. (U. Southern California) **Loneliness in maturity.** *Journal of Humanistic Psychology*, 1969(Fal), Vol. 9(2), 167-181.—Discusses the modern concept of loneliness as being more an existential problem than one of self-alienation in a neurotic sense. Loneliness appears in the identity crises of adolescents, continues to find expression in problems associated with achieving the idealized image of the adult, and becomes more acute during the aging period. The neurosis of our time is conceived as a loss of identity, and it is suggested that today "psychotherapy, especially group therapy, has become a necessary adjunct to education." The religious and metaphysical aspects of loneliness in the aged are discussed, including ways in which old people successfully combat loneliness through a belief in an afterlife, a continuing satisfying occupation, or through working for and with people. It is suggested that an approach to existential loneliness increasingly used today lies in "the experience of mystical oneness with all men and with the universe." References from contemporary literature and the arts are included. (23 ref.)—*P. McMillan.*

4010. Butler, Robert N. (George Washington U., Medical School) **Age-ism: Another form of bigotry.** *Gerontologist*, 1969(Win), Vol. 9(4, Pt. 1), 243-246.

4011. Cameron, Paul. (U. Louisville) **The generation gap: Which generation is believed powerful versus generational members' self-appraisals of power.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 403-404.—Assesses Ss' "beliefs about his own wealth and power and how he believed the generations compare" using a 3-way fixed-effect analysis of variance (3 levels of generation \times sex \times 2 levels of socioeconomic status). Results indicate agreement between generations that "the middle-aged are the wealthiest and most powerful and young adults the poorest and least powerful," and that those "higher in socioeconomic status" believe "themselves more wealthy while males tended to judge themselves more powerful and wealthy."—*G. Steele.*

4012. Horrocks, John E. & Mussman, Milton C. (Ohio State U.) **Middlence: Age related stress periods during adult years.** *Genetic Psychology Monographs*, 1970(Nov), Vol. 82(2), 119-159.—Tested hypotheses of age-related stress periods in normal adulthood by the mailing of a 7-concept, 21-item semantic differential scale to 3000 public school employees. The 41% return for teachers permitted computer analysis of attitude intensity decreases between successive pairs of 5-yr interval age groups from 20-70 yr. Using the assumption that a significant decrease in intensity of affect toward central social objects suggests personal disequilibrium, support for age-related stress periods was found for female teachers in their late 20s, female married teachers in their early 40s, and female married nonteachers and male married teachers in their early 50s. (56 ref.)—*Author abstract.*

4013. Howell, Sandra C. & Loeb, Martin B. (St. Louis U., Medical School) **Nutrition and aging: A monograph for practitioners.** *Gerontologist*, 1969(Aug), Vol. 9(3, Pt. 2), 1-122.—Reviews current research activity on aging to integrate "social, cultural, economic, psychological, and bionutritional research information" thereby facilitating the development of programs "to promote improved nutrition and social health for aging adults." The studies described "report recent nutritional histories of sample groups of older individuals in terms of their current income levels." Because of the extreme variation among the population, generalization is cautioned against. (5 p. ref.)—*G. Steele.*

4014. Lysaght, Carol E. (Boston U., School of Education) **Geriatrics: Effect of speech rate and pacing procedures upon the responses to verbal stimuli by three age groups.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 434.

4015. Palmore, Erdman. (Duke U., Center for the Study of Aging & Human Development) **Predicting longevity: A follow-up controlling for age.** *Gerontologist*, 1969(Win), Vol. 9(4, Pt. 1), 247-250.—Presents findings from a longitudinal study of 268 60-94 yr. old Ss which suggest that, in general, the most important ways to increase longevity are to (a) maintain a useful and satisfying role in society, (b) maintain a positive view of life, (c) maintain good physical functioning, and (d) avoid smoking.—*Journal summary.*

4016. Schonfield, David. (U. Calgary, Alberta, Canada) **Family life education study: The later adult years.** *Gerontologist*, 1970(Sum), Vol. 10(2), 115-118.

—Traditional children's stories rarely contain descriptions of older people and school curricula seldom include references to the topic of aging. Universities should be considered as a focal point for increasing awareness and sympathetic understanding of aging processes. Professional activities in these fields are likely to be seminal.—*Journal abstract.*

4017. Youmans, E. Grant. (U. Kentucky) **Some perspectives on disengagement theory.** *Gerontologist*, 1969(Win), Vol. 9(4, Pt. 1), 254-258.—Discusses perspectives on disengagement theory—the need for modifications, the lack of empirical support, and inadequate recognition of social change—which suggest a lack of confidence in its usefulness as a general theoretical explanation of the social psychological aspects of human aging. It is suggested that a developmental concept, i.e., the life course, offers a more comprehensive and promising framework for research and application in social gerontology. (35 ref.)—*Journal summary.*

SOCIAL PSYCHOLOGY

4018. Atteslander, P. *Methoden der empirischen Sozialforschung*. [Methods of empirical social research.] Berlin, W. Germany: Walter de Gruyter, 1969. 313 p.—Analyzes the theory and strategy of social research as well as its practical application within the context of empirical sociology and social psychology.—*I. D. London*.

4019. Blair, Margaret. (Palo Alto, Calif.) *Meditation in the San Francisco Bay area: An introductory survey*. *Journal of Transpersonal Psychology*, 1970, Vol. 2(1), 61-70.—The practice of meditation has been "an integral part of Asian religious, philosophical, and metaphysical teachings." In the San Francisco Bay Area many groups are meeting to learn about and practice meditation. While classical forms of meditation are practiced, new forms are emerging which seem to be suitable to the American culture. Meditation is defined as a highly dynamic state which is nonselfish in its highest forms. Several meditation centers in the San Francisco Bay Area are described and there is a listing of courses and classes being offered. The conclusion is drawn that the practice of meditation has taken a firm hold in the area, that courses are being included in college curricula, that meditation may be used for therapeutic benefit, and the practice of meditation is stimulating interest in Eastern psychological and philosophical concepts. 4020. Bueva, L. P. *Sotsial'naya sreda i soznanie lichnosti*. [Social environment and the consciousness of the individual.] Moscow, USSR: Moscow U., 1968. 268 p.—Presents an analysis of (a) the conditions influencing the "formation of the individual, his activity and spiritual world" and (b) "the social group and its place in the structure of society."—*I. D. London*.

4021. Lindesmith, Alfred R. & Strauss, Anselm L. (Indiana U.) *Readings in social psychology*. New York, N.Y.: Holt, Rinehart, & Winston, 1969. ix, 357 p. \$6.95 (paper).—A collection of readings by various authors designed for use with the text, *Social Psychology*, also by A. R. Lindesmith and A. L. Strauss. Areas covered include symbolic processes, differentiation and internalization, socialization and interaction, and deviance.

4022. Ryvkina, R. V. & Vinokur, A. V. *Sotsial'nyi eksperiment*. [The social experiment.] Moscow, USSR: Nauka, 1968. 172 p.—Examines the problems connected with the organization, significance, and goals of the social experiment. Experiment in the social context is viewed as a means of "social direction," i.e., as a "social-transformational activity."—*I. D. London*.

4023. Stark, Stanley. (Michigan State U.) *Gemeinschaft, inner creation, and role-taking (empathy)*. Ill. Charles Horton Cooley on "social" vs "spatial" ("material") knowledge. *Psychological Reports*, 1970 (Feb), Vol. 26(1), 183-210.—Presents the 3rd of a series intended to relate F. Toennies' distinction between Gemeinschaft and Gesellschaft to the difference between: (a) intuitional and inferential role-taking (empathy), (b) Erlebnis and Erfahrung experience, and (c) Rorschachian inner creation and rationality. C. H. Cooley's concepts of social knowledge and spatial knowledge are interpreted as intuitional and inferential, respectively. It therefore clusters social knowledge with Gemeinschaft, Erlebnis, and inner creation; and spatial knowledge with Gesellschaft, Erfahrung, and rationality.

G. H. Mead's concept of attitude-taking is also examined. It considers Mead to have confounded intuition and inference, with the result that contemporary Meadians may mean qualitatively different psychological processes when they speak of role-taking or empathy. It is suggested that this is due to his concept's large, sometimes exclusive, inferential component, and that it is this inferential component that has been exploited by the psychometric approach of the past 20 yr. Empathy tests are tests of an interpersonal version of what Cooley meant by spatial knowledge. Gouldner's analysis of the role-taking of Epaminondas planning a battle and Plato plotting a dialogue is used as a basis for these suggestions. Gouldner's dialogist-as-dramatist illustrates Cooley's social knowledge, and his general, Cooley's spatial knowledge. (50 ref.)—*Journal abstract*.

CULTURE & SOCIAL PROCESSES

4024. Artanovskii, S. N. *Istoricheskoe edinstvo chelovechestva i vzaimnoe vliyaniye kul'tur*. [The historical unity of mankind and the mutual influence of cultures.] Leningrad, USSR: Prosveshchenie, 1967. 268 p.—Presents a critical "philosophico-methodological" analysis of contemporary bourgeois conceptions of human culture at the ethnographic-sociological level.—*I. D. London*.

4025. Davis, Clive M. (Syracuse U.) *Education and susceptibility to the Muller-Lyer illusion among the Banyankole*. *Journal of Social Psychology*, 1970 (Oct), Vol. 82(1), 25-34.—In 2 of 3 comparisons a significant negative relationship between susceptibility to the Muller-Lyer illusion and yr. of education of adult male Banyankole (western Uganda) was obtained. This finding of decreased susceptibility with increasing education is in accord with the "sophistication" hypothesis suggested by M. H. Segall, D. T. Campbell, and M. J. Herskovits to explain age differences in Muller-Lyer illusion susceptibility.—*Author abstract*.

4026. Hofmeijer, D. H. (Nederlandse Emigratiedienst, Hague, Netherlands) *Lokkende verten*. [Enticing distances.] *Mens en Onderneming*, 1970 (May), Vol. 24(3), 176-193.—Describes the pattern of emigration from the Netherlands. The high point of emigration occurred in 1951 when 48,000 left their native land. Because of the increase in industrialization in the Netherlands, the rate of emigration has steadily decreased to about 9500 in 1968. About 2/3 of the emigrants moved to Canada and Australia. The motives for the emigration usually were personal, e.g., joining relatives already migrated, escaping crowded conditions, and availing themselves of a greater opportunity to develop a business in the "new land" than in the "old country." The achievements of the emigrants in their adopted lands were generally favorable. About 20% of the emigrants were very successful. (19 ref.)—*A. J. Ter Keurs*.

4027. Lem, S. *Model' kul'tury*. [A model of culture.] *Voprosy Filosofii*, 1969, Vol. 23(8), 49-62.—Culture is viewed in terms of a "system of games." Within this context, the problems of "cultural codes" and "culture as a meta-game" are considered, and a "model of culture" is proposed.—*I. D. London*.

4028. McKinney, John C. (Duke U.) *Social structure and sociometry*. *Group Psychotherapy*, 1968, Vol. 21(2-3), 113-120.—Explores the role of sociometry in the explication of social structure. Sociometry can contribute meanings to structural characteristics. It has the advan-

tage of extracting individual preference while delineating the networks of relationships indigenous to the social structure.—A. Krichev.

4029. Pakrasi, Kanti & Halder, Ajit. (Indian Statistical Inst., Calcutta) **Polygynists of urban India, 1960-61.** *Indian Journal of Social Work*, 1970(Apr), Vol. 31(1), 49-62.—Polygyny as an established social practice is still in existence even in urban areas of India. The prevalence rate is 6.65 for urban Hindus and 8.61 for urban Muslims. It is favored by people in almost all occupation classes. Girls below 16 are usually selected in the cases of 1st marriages, but older females are preferred relatively more at the time of the 2nd marriage. It is felt that incidents of polygyny will diminish as a result of the 1955 Hindu marriage laws in Hindu society, but will continue as before in Muslim society.—I. W. Kidorf.

4030. Ramachandran, P. (Tata Inst. of Social Sciences, Bombay, India) **Modern-traditional social values: Analytical procedures.** *Indian Journal of Social Work*, 1970(Apr), Vol. 31(1), 63-73.—Attempted to ascertain the social values (modern or traditional) of students, teachers, institutional chiefs, and parents of students in India. The study was based on responses to a questionnaire. The present paper discusses the analysis of the responses, weighs the merits and demerits of the method, provides a rationale for the method used, and offers implications for the applicability of the present procedure to other similar questionnaires.—I. W. Kidorf.

Ethnology

4031. Berry, J. W. (Queen's U., Kingston, Ontario, Canada) **Marginality, stress and ethnic identification in an acculturated aboriginal community.** *Journal of Cross-Cultural Psychology*, 1970(Sep), Vol. 1(3), 239-252.—Measures of psychological marginality, alienation, social deviance, psychosomatic stress, attitudes to white society, westernization, personal barriers, and ethnic identification were administered to 31 Australian aborigines in an acculturated community. The pattern of results supported the theory of marginality but which also showed more marginality, deviance, and stress for those rejecting the dominant white society. Interpretation is in terms of reaffirmation of traditional values. (26 ref.)—A. Krichev.

4032. Crandall, Faye E. (Clark U.) **A cross-cultural study of Ahtena Indian and non-Indian high school students in Alaska on selected value orientations and measured intellectual ability.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 214-215.

4033. Lent, Richard H. (Northeastern U.) **Binocular resolution and perception of race in the United States.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 521-533.—Employed 66 whites, 28 Mexicans, 13 light Negroes, and 13 dark Negroes to extend the broad conclusion that group memberships play a part in the resolution of binocular conflict beyond the single geographic entity and the specific ethnic groups with respect to which it was derived. The variant forms in which the resolutions of binocular conflict was manifested, and the failure to provide an explanation of the descriptive results by introducing certain conceptually associated variables, suggest the need for an experimental design in which relevant social situational variables complement those with specifically individual reference. (36 ref.)—*Journal abstract.*

4034. Neuwirth, Gertrud. (Carleton U., Ottawa,

Ontario, Canada) **A Weberian outline of a theory of community: Its application to the "Dark Ghetto."** *British Journal of Sociology*, 1969(Jun), Vol. 20(2), 148-163.—Reviews the main arguments of M. Weber's theory of community and applies his viewpoint to the "dark ghetto." It is demonstrated that Negroes living in urban slums have the attributes of a negatively privileged status community, are "excluded from economic and political privileges, deprived of social esteem and unable to influence the imposition and application of rules which define their participation within the larger community." It is therefore shown that they are also "unable to effect their own community closure and are prevented from achieving such closure by representatives of the white community." Certain features of the Black Power movement are interpreted within this framework as "attempts to produce the necessary conditions for community closure and to attain thereby economic and political power." It is concluded that although incomplete, the application of the Weberian framework demonstrates the usefulness of this approach for the analysis of ethnic groups.—M. Maney.

4035. Worthy, Morgan & Markle, Allan. (Georgia State U.) **Racial differences in reactive versus self-paced sports activities.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 10(3), 439-443.—Hypothesized that black athletes perform better, relative to white athletes, in sports activities that are reactive in nature than in sports activities that are self-paced in nature. Evidence in support of this hypothesis is presented from the fields of professional baseball, professional basketball, and college basketball. These differences are apparently independent of differences in socioeconomic class. Some evidence indicates that early father absence is related to poorer self-paced performance.—*Journal abstract.*

Social Structure & Social Role

4036. Panda, K. C. & Das, J. P. (Indiana U.) **Acquisition and reversal in four subcultural groups generated by caste and class.** *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 267-273.—Tested whether belonging to a high caste in a traditional Hindu social system may offset the ill effects of cultural deprivation associated with poverty. 116 8-10 yr. old poor and rich boys, who belonged to either the highest or the lowest caste, were compared in 2 verbal conditioning experiments and on word reading speed. High-caste Ss, irrespective of economic class, were superior to low-caste Ss in acquisition and reversal of verbal response. In reading speed, both caste and economic class were relevant: high caste or rich Ss, or both, were superior. (French summary)—*Journal abstract.*

4037. Poitou, Jean P. (Lab. of Social Psychology, Aix en Provence, France) **Status congruence as a cognitive bias.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 592-597.—Conducted an experiment on the learning of hierarchical structures to examine if status congruence constitutes a cognitive bias. 2 types of material (individual names and nonsense syllables) were compared by 36 male undergraduates to test whether such a bias results from the abstract properties of complete ordering and congruent mapping, or from the individuals' familiarity with status congruent

social organizations. D. B. De Soto's technique for the learning of social structures was used in both stages of the experiment. In the 1st stage $\frac{1}{2}$ of the Ss learned a completely ordered influence structure among 4 hypothetical persons, while the other $\frac{1}{2}$ was presented with an identical ordering of nonsense syllables. In the 2nd stage Ss from the 1st group learned the matching of the list of names with an ordered list of army officers' ranks, while for the other group of Ss the nonsense syllables were matched with a list of integers. In each group $\frac{1}{2}$ of the Ss were presented with a congruent and the other $\frac{1}{2}$ with a noncongruent mapping. Results show that noncongruence is as detrimental to the learning of a social status structure as to the learning of an abstract one. This result is discussed in terms of E. Sampson's model of congruence expectancy. (20 ref.)—*Journal abstract*.

4038. Popov, S. *Sotsializm"t, otchuzhdenieto i svobodata*. [Socialism, alienation and freedom.] Sofia, Bulgaria: Bulgarian Academy of Science, 1968. 254 p.—Presents a Marxist treatment of the issues. Freedom is seen as the "recognition and assimilation of necessity." Criticized are both those who consider the problem of alienation as of prime importance under the conditions of socialism and those who would deny the existence of any elements of alienation whatsoever under socialism.—*J. D. London*.

4039. Winch, Robert F., Mueller, Samuel A., & Godiksen, Lois. (Northwestern U.) **The reliability of respondent-coded occupational prestige**. *American Sociological Review*, 1969(Apr), Vol. 34(2), 245-251.—If Duncan's Socio-Economic Index is accepted as a measure of socioeconomic status, it is possible to have untrained Ss code occupations (e.g., their fathers') and for a computer to convert such codings into socioeconomic scores. 327 undergraduates served as Ss. This procedure eliminates the need for the researcher to code occupations into occupational prestige scores. With respondents from 5 campuses of diverse ethnicities, S-coder correlations on prestige equivalents of the occupations correlated .85, and it is estimated that Ss' codings yielded 93% relative efficiency in estimating socioeconomic prestige scores.—*Journal abstract*.

Religion

4040. Havens, Joseph. (U. Massachusetts) **The course of college religious conflict**. *Religious Education*, 1970(May), Vol. 65(3), 257-264.—Clinical material drawn from 32 college Ss provides longitudinal data concerning religious conflict handled in 4 ways: loss of ultimate concern, short-circuiting of the religious impulse, intellectual resolutions, and broad integrative restructuring. Factors involved in integrative restructuring, founded upon good mental health, include: a broad view of religion; a sense of religion as a direction of movement, more than a high-water mark of achievement; and an openness to innovation or new creation in personal religion.—*S. E. Gavin*.

4041. Jonsen, Albert R. (U. San Francisco) **Moral theology and the modern Catholic college**. *Religious Education*, 1970(May), Vol. 65(3), 245-251.—Through explicit teaching and other cultural influences, "the general atmosphere and attitude of the American Catholics of the past and, in part, present generation reflect the style and content of classical moral theology: insistence on careful observation of law, profound respect for authority, distrust of ideas from without the

system, tendency to reduce new problems to old, already answered questions." Since today's students must be able to live creatively with questions, current changing perspectives in moral theology prove advantageous. Themes of contemporary moral theology cast problems in a vastly different light, leading to different solutions. For instance, beneath sexual problems may lie not lust, but loneliness; revolt may result not from disobedience, but from nonresponsibility.—*S. E. Gavin*.

4042. Kilpatrick, Dean G., Sutker, Louis W., & Sutker, Patricia B. (Veterans Administration Hosp., New Orleans, La.) **Dogmatism, religion, and religiosity, a review and re-evaluation**. *Psychological Reports*, 1970(Feb), Vol. 26(1), 15-22.—A review of the literature concerning religious preference, religiosity and dogmatism shows that Catholics consistently had been found to be more dogmatic than members of other religious groups. Since no Southern sample had been reported, 245 male and 250 female Southern undergraduates were administered Form E of the Dogmatism Scale. Ss were Catholics, Protestants, Jews, and nonbelievers and were asked their average monthly church attendance. Churchgoers were generally more dogmatic than nonchurchgoers. Catholics and nonbelievers were less dogmatic than Jews and Protestants. Differences between these and previous findings are discussed, and possible explanations are given. Several methodological suggestions are made concerning future research. It is concluded that speculations about the relative dogmatism of religious groups as a whole are inappropriate.—*Journal abstract*.

4043. McClain, Edwin W. (U. Tennessee) **Personality correlates of church attendance**. *Journal of College Student Personnel*, 1970(Sep), Vol. 11(5), 360-365.—The 16 PF and the EPPS were administered to 292 students who were classified in 1 of 5 categories indicating their frequency of church attendance. It was found that the more regularly the male Ss attend church the greater their preoccupation with inner experience whereas the opposite was found to be the case for female Ss. The results of the regular church attenders is very similar to the norms of college students in general. However, nonattendance is strongly associated with acceptance of the Freudian concept of the pleasure principle and with rejection of the reality and morality principles. Support was also found for the notion that creative people are likely to be found among those who are not regular church attenders. (29 ref.)—*R. H. Mueller*.

Cross Cultural Comparison

4044. Cambier, Anne & Titeca, Danièle. **Dessin et apparence nationale**. [Drawings and national affiliation.] *Revue de Psychologie des Peuples*, 1970(Jun), Vol. 25(2), 174-189.—Studied national differences and peculiarities through the analysis of drawings done by 50 girls and 50 boys, divided into 10 groups according to sex. The Ss represented Germany, Belgium, France, Italy, and the Netherlands. Ss were homogenous in regard to age (8-10 yr.), time of residence in native country, time of residence in Brussels, education, and socioeconomic level. Each S drew (a) a tree, (b) a human being of each sex, and (c) a walk in the country with friends. 400 pictures were collected. Detailed analyses were made of the drawings with the help of Latscha tables. No significant national differences were noted in regard to the tree drawing. However, significant differences were

observed in the drawing of masculine and feminine figures. The most significant differences were found between Germans and Italians. The drawing test was considered to be an effective research instrument where verbal comprehension is not a necessity. Representative drawings are included.—P. Hertzberg.

4045. Davis, Clive M. & Carlson, Julia A. (Syracuse U.) **A cross-cultural study of the strength of the Müller-Lyer illusion as a function of attentional factors.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 403-410.—Administered 2 types of Müller-Lyer stimuli to several samples of adult male Ss in Uganda (N = 271) and the United States (N = 128) under 2 instructions: (a) to attend to the horizontal lines and withhold attention from the angled lines, and (b) to report which of the 2 horizontal lines was longer. When the horizontal and oblique segments were separated and of different colors, there were no instructional differences. When the angled lines joined the horizontals and the stimuli were all of 1 color, instructional differences were obtained, but the relative change in illusion susceptibility as a function of 2 types of instructions differed for the 4 samples tested. This finding was interpreted as partially supporting an attentional interpretation of the cross-cultural difference. The previously reported lesser susceptibility of the African Ss to the Müller-Lyer illusion was not replicated when the set of stimuli employing connected horizontal and oblique lines and a single color was employed, calling into question the generality of the earlier findings. (18 ref.)—*Journal abstract*.

4046. Doob, Leonard W. (Yale U.) **Correlates of eidetic imagery in Africa.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 223-230.—Established the presence of eidetic imagery (EI) in a sample (N = 36) of an African society, the Hutu of Rwanda. Among Tanzanian children and young Ganda adults no link between EI and kwashiorkor could be tentatively ascertained. Secondary-school students from a variety of tribes in Tanzania (N = 401) and primary-school pupils among the Kamba of Kenya (N = 213) experienced little or no difficulty in replying to questions about their EI and other images. For 15 matched pairs of the latter, a significant relation was noted between replies in an interview concerning EI and an actual test 3 mo. later. In each of the studies no consistent or impressive relation between EI incidence and demographic data was ascertained other than a slightly negative association with age and acculturation. Incidental evidence for the subjective reality of the EI phenomenon appeared, but the correlates remain elusive.—*Author abstract*.

4047. Engebretson, Darold & Fulmer, Daniel. (U. Hawaii) **Cross-cultural differences in territoriality: Interaction distances of native Japanese, Hawaii-Japanese, and American Caucasians.** *Journal of Cross-Cultural Psychology*, 1970(Sep), Vol. 1(3), 261-269.—An adaptation of the felt figure technique was used to investigate distance between dyads as a function of relationship, culture, sex, and conversational content. Relationship was the most powerful determinant. Other significant results were scattered.—A. Krichew.

4048. Jakobovits, Leon A. (U. Illinois, Center for Comparative Psycholinguistics) **The affect of symbols: Towards the development of a cross-cultural graphic differential.** *International Journal of Symbolology*, 1969(Aug), Vol. 1(1), 28-52.—Previous research with the semantic differential technique has established the

cross-cultural generality of 3 basic affective dimensions identified as evaluation, potency, and activity. An attempt was made to develop a graphic equivalent of the pan-cultural short form semantic differential. This "graphic differential" is composed of bi-polar scales made up of pictographic opposites on which Ss rate a concept by placing a check mark on the 7-point scale. Such a nonverbal instrument would be culture free and would, under several conditions, have certain distinct advantages over the verbal semantic differential form. Data are reported for a pretest of the graphic instrument in 5 language/culture communities (American English, Delhi Hindi, Finnish, German, and Japanese). Several graphic scales are identified that provide reliable and effective indices of the evaluation dimension of affect. With respect to the potency and activity dimensions, the results are less satisfactory, although some of the graphic scales can be used for this purpose when chosen indigenously, i.e., independently for each culture.—*Journal abstract*.

4049. Kagitcibasi, Cigdem. (Middle East Technical U., Ankara, Turkey) **Social norms and authoritarianism: A Turkish-American comparison.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 444-451.—Examines the influence of social norms on the patterning of authoritarian attitudes. Higher intercorrelations of the various components of authoritarianism were found among American (N = 301) than among Turkish (N = 332) high school students, supporting the view of authoritarianism as a relatively coherent and consistent syndrome in the United States but not in Turkey. Mean values of most of the authoritarian variables, however, were higher in Turkey than in the United States, which was attributed to the presence in Turkey of 2 strong social norms, i.e., respect for authority and patriotism. These norms may serve to sharpen and increase those components of authoritarianism to which they are relevant, at the same time weakening the coherence of the whole syndrome in Turkey. (19 ref.)—*Journal abstract*.

4050. Levin, Joseph & Karni, Eliezer S. (Tel-Aviv U., Israel) **Demonstration of cross-cultural invariance of the California Psychological Inventory in America and Israel by the Guttman-Lingoes smallest space analysis.** *Journal of Cross-Cultural Psychology*, 1970(Sep), Vol. 1(3), 253-260.—The smallest space analysis of proximities was applied to the intercorrelations matrix of CPI scales in the manual and to a matrix for 550 male Israeli medical school applicants. Cross-cultural invariance of the pattern of scale intercorrelations led to a correlation of .92.—A. Krichew.

4051. Nakanishi, Nobuo. (Osaka U., Japan) **Symbol perception of the Kahn Test of Symbol Arrangement among four cultures.** *International Journal of Symbolology*, 1969(Aug), Vol. 1(1), 20-24.—Presents a cross-cultural study of enculturation and acculturation processes as they are reflected in the learning of visual symbols. Popular responses of naming to the Kahn Test of Symbol Arrangement showed enculturation differences between the Christian country of America, the Buddhist country of Japan, the Taoist-Buddhist country of China (Formosa), and the Islamic country of East Pakistan as the people drew in their learning from very different cultural sources.—*Journal abstract*.

4052. Pratz, Owen R. (U. Texas) **A study of the affective correlates of academic achievement in school children of different countries.** *Dissertation*

Abstracts International, 1970(Jun), Vol. 30(12-A), 5299.
 4053. St. George, Ross. (U. Waikato, School of Social Sciences, Hamilton, New Zealand) **The psycholinguistic abilities of children from different ethnic backgrounds.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 85-89.—Compared ethnically different children from similar low socioeconomic backgrounds on the Illinois Test of Psycholinguistic Abilities (ITPA). On the ITPA, Maori children ($N = 18$) performed at a significantly lower level than European children ($N = 14$). ITPA subtest differences did not entirely support the view that poor performance for the Maori Ss was the result of deficits on subtests measuring auditory and/or vocal aspects of psycholinguistic ability. Results support the view that familial experiences differentially affect language skills. The possibility that, culturally, the European children have more in common with the world of the school is also considered.—*Journal abstract*.

4054. Sundberg, Norman D., Rohila, Pritam K., & Tyler, Leona E. (U. Oregon, Wallace School of Community Service & Public Affairs) **Values of Indian and American adolescents.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 374-397.—Derived 17 hypotheses about Indian-American differences from a literature review. 9th grade Ss representing school populations in towns in Northern India ($N = 48$) and Western United States ($N = 48$) answered 90 Q-sort items. As expected, Indian Ss scored higher on deference and conformity, external control, extrinsic work values, and planning; Americans scored higher on sociability, sensuous enjoyment, and religiosity. Contrary to expectations, no differences were found on areas, i.e., individuality, free will, and democratic values. When items were dichotomized into endorsement and rejection, the 2 groups showed 4 times as much communality as divergence. Similarity was greater between sexes within the cultures than across cultures. Findings imply more complexity than is suggested by the distinction between traditional and modern values. (44 ref.)—*Journal abstract*.

4055. Thelner, Eric C. **Current approaches to symbolization: The Kahn Test of Symbol Arrangement.** *International Journal of Symbolism*, 1969(Aug), Vol. 1(1), 52-58.—The Kahn Test of Symbol Arrangement represents a basically projective test employing objective scoring criteria. It provides a template for evaluating symbolic productions according to 9 different levels of abstraction. Study I sought to assay potential difference in thought processes among 3 variant cultures, American, German, and Vietnamese. Findings suggest that the Vietnamese demonstrated less reliance on formal objective characteristics, whereas the German and American samples employed more. The Vietnamese, conversely, showed greater reliance on abstract associations. Study II was an assessment of thought processes among ghetto resident, Negro males. Findings suggest that this population was more conceptually concrete, rigid, and structure-seeking than either a normative population or the 3 experimental populations. Conversely, variation was not great, both studies therefore supporting the hypothesis that emotionally healthy men, regardless of culture, possess relatively comparable capacities to employ abstraction in thought.—*Journal summary*.

4056. Welsh, George S. (U. North Carolina) **Preferences for basic geometric shapes by American**

and Egyptian subjects. *International Journal of Symbolism*, 1969(Aug), Vol. 1(1), 58-66.—The Welsh Figure Preference Test was used to determine whether there is a consistent order of preference for 5 basic geometric shapes: circle, triangle, square, pentagon, and Greek cross. Results were obtained for 14 groups of American Ss and 16 groups of Egyptian students. It was found "that the Egyptian and the American orders of preference differ only for the cross and the circle which are either 1st or 2nd for both cultural samples." The remaining shapes fall in the order triangle, pentagon, square, and in this sense there is an order of preference common to Americans and Egyptians. Some minor inconsistencies appear when individual group orders are examined. Cultural explanations of the results are held to be inadequate and it is suggested "that the symbolism of geometric shapes may be approached through the psychology of individual personality." (34 ref.)—*P. E. Lichtenstein*.

4057. Williams, John E., Morland, J. Kenneth, & Underwood, Walter L. (Wake Forest U.) **Connotations of color names in the United States, Europe, and Asia.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 3-14.—Explored the hypothesis of cross-cultural generality in the connotative meanings of common color names via semantic differential ratings by 6 groups of college students: American Caucasians, American Negroes, Germans, Danes, Hong Kong Chinese, and Asiatic Indians. The hypothesis was supported by the finding of general agreement in the rank-order placement of the 10 color names along the evaluation, potency, and activity dimensions. On evaluation, "white" was rated most positively by all 6 groups, while "black," "brown," and "gray" were rated most negatively. Some possible explanations of these cross-cultural meanings are discussed.—*Author abstract*.

Family

4058. Leventhal, Gerald S. (Wayne State U.) **Influence of brothers and sisters on sex-role behavior.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 452-465.—It is often assumed that children imitate their siblings' behavior. This view implies that men with sisters display a less masculine behavior pattern than men with brothers. In an investigation of 218 male undergraduates with 1 sibling, results from the femininity scale of the CPI indicate that men with older sisters display more masculine behavior than men with older brothers. Men with older sisters displayed greater interest in outdoor and technical activities, greater athletic skill, and greater desire for membership in all-male peer groups than men with older brothers. Findings indicate there are trait dimensions on which 2nd-born males in a 2-child family adopt behavior patterns opposite those of their older sibling. 2 possible mechanisms are proposed to account for this tendency: (a) the younger of 2 male children may try to behave differently from his older brother in order to prevent himself from being compared unfavorably to his more advanced older sibling; and (b) following an initial period during which a younger male imitates his older sister, he may try to behave differently from her in order to avoid parental and peer disapproval. (33 ref.)—*Journal abstract*.

4059. Osborne, R. T. (U. Georgia, Testing & Evaluation Center) **Population pollution.** *Journal of Psy-*

chology, 1970(Nov), Vol. 76(2), 187-192.—Nobel Laureate William Shockley 1st used the term "population pollution" in referring to the negative correlation between measured intelligence of children and the size of the families they represent. In 1314 children representing 669 families, differential fertility rates were examined by race and by level of test IQ. There is a significant negative correlation of $-.367$ between family size and IQ of school age children representing that family. In the present sample, which is limited to the school age population of one Southern rural county, the family reproductive rate for children with IQ's below 70 is 12 times as great for Negro as for white families. Overall generalizations to other geographic areas and to other populations cannot be made until the study is replicated in other schools. Results indicate that J. Higgins' optimistic explanation of "Cattell's paradox" seems applicable only to the white population, leaving unanswered Shockley's question concerning the possibility of dysgenics caused by a disproportionately high birth rate of the most disadvantaged.—*Author abstract.*

4060. Schoicket, Sally G. (Columbia U.) **Affinal relationships of the divorced mother.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 469.

4061. Simmons, Jean. (Cornell U.) **Why do they want to stay home? A study of career oriented mothers with preschool children.** *Cornell Journal of Social Relations*, 1970(Spring), Vol. 5(1), 29-39.—Tested the norm against mothers of preschool children working ($N = 8$) by interview and questionnaire. 5 professionally trained and/or career-oriented mothers reasoned why they were not in favor of working due to effects: (a) of mother's working on the child, (b) on the mother of the separation from her child, and (c) of separation on the bond between mother and child. 3 mothers who favor working had strong desires to work and weaker fears about their child's security and their own security in the mother-child relationship. Nye and Hoffman hypothesize that if a mother perceives that her child's personality is a product of his interaction with his total environment and not just with his mother, she will be more likely to believe that stimulation in all areas is necessary for his psychological growth.—*J. DiGiovanni.*

4067. Phillips, James K. (U. Virginia) **A study of the sexual attitudes, behavior patterns, and attitude-behavior pattern inconsistencies of graduate students.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 159-160.

4068. Wood, Carl; Shanmugam, N., & Mrederith, E. (Monash U., Queen Victoria Hosp., Melbourne, Australia) **The risk of premarital conception.** *Medical Journal of Australia*, 1969(Aug), Vol. 2(5), 228-232.—Attempted to determine the number of women considered to be "at risk" of premarital pregnancy by surveying 200 mothers by a postpartum questionnaire. 142 Ss admitted to premarital coitus and only 11 had used effective contraception; therefore, 131 were "at risk" of premarital conception. The significance of the findings are discussed and some recommendations are made to avoid the sequelae of this behavior.—*Journal abstract.*

Birth Control & Abortion

4069. Caccavale, J. L. & Bonura, J. V. (California State Coll., Los Angeles) **Relation of guilt to the use of contraceptives.** *Research Bulletin*, 1969, Vol. 5, 1-14.—A study of 45 women using artificial contraceptives (Group A), 45 unwed mothers (Group B), and 45 mothers who rejected the use of artificial contraceptives (Group C) on 30 items selected from the MMPI to measure guilt feelings and a 10-item questionnaire to elicit information on causal factors of guilt showed that Group A had a significantly less number of sexual intercourses and less initiation from their side to sexual intercourse than Group C. Group A mothers used contraceptives because they could not afford to have more children though they wished to have. 92% of Group A felt that they were not going against their religion, while the rest did not bother about it. All Group A Ss reported experiencing vague symptoms, migraine, and eye trouble while very few of Groups B (17%) and C (4.4%) experienced these. Group A obtained a significantly higher mean score than groups B and C in the composite scores of MMPI subtests, revealing high guilt feelings. Differences between the groups were interpreted as the behavioral manifestations of the blocked libidinal energy caused by the conflict between a biological drive to reproduce and the social and economic pressures of

Western society. The result of this conflict is an extreme feeling of guilt.—U. Pareek.

ATTITUDES & OPINIONS

4070. Berry, J. W. (Queen's University, Kingston, Ontario, Canada) **A functional approach to the relationship between stereotypes and familiarity.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 29-33.—Used data from J. W. Berry's (See PA, Vol. 45:Issue 4) study of Australian state stereotypes to test predictions derived from a functional theory of stereotypes. Both uniformity and differentiation appear to co-exist in a single stereotype, and both were positively related to familiarity among states. However, where a measure of guessing was employed, differentiation increased greatly in stereotypes among least familiar states. Confirmation of the predictions was considered to support the hypothesized function of stereotypes as both efficient and accurate tools in intergroup relations.—*Journal abstract*.

4071. Cottle, Thomas J., Edwards, Carl N., & Pleck, Joseph. (Massachusetts Inst. of Technology) **The relationship of sex role identity and social and political attitudes.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 435-452.—Studied the relationship between conscious social role preferences, unconscious sexual identifications, and attitudes toward 5 categories of social and political issues. Based on factor scores of inventory items, the categories include political liberalism, birth control, sex-role morality, racial discrimination, and the achievement ethic. The population studied consisted of men and women from communities designated working class, middle class, and upper class. Controlling for the effects of age, sex, marital status, occupation, education, and political party preference, results indicate statistically significant associations between conscious and unconscious masculinity and femininity and attitudes toward all 5 categories of issues. The patterns of associations, however, are not always consistent. Discussion includes a consideration of sex-role identity as a value and the implication of sex-role differentiation for the integration of personality as well as social institutions. (30 ref.)—*Journal summary*.

4072. Goding, William E. (U. Denver) **The power and hostility dimensions of free speech attitudes.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5523.

4074. Kerlinger, Fred N. (New York U.) **Comment on Zdep and Marco's "Commentary on Kerlinger's structural theory of attitudes."** *Psychological Reports*, 1970(Feb), Vol. 26(1), 289-290.—S. M. Zdep and G. L. Marco's (see PA, Vol. 44:18531) criticisms of F. N. Kerlinger's (see PA, Vol. 41:5885) criterial referent theory of attitudes, with 1 exception, lack validity. The criterial referent notion is misconstrued, attitudes are defined too narrowly, bipolarity of attitudes is plucked out of an unrotated factor matrix, and the nature and purpose of scientific theory seem to be misconceived.—*Journal abstract*.

4075. Krystall, Eric R., Friedman, Neil; Howze, Glenn, & Epps, Edgar G. (Cornell U.) **Attitudes toward**

integration and black consciousness: Southern Negro high school seniors and their mothers. *Phylon*, 1970(Sum), Vol. 31(2), 104-113.—Results of the 1967 Tuskegee Area Study, an annual social survey conducted by junior and senior social science majors at Tuskegee Institute, indicate that high school seniors, compared with their parents, are (a) more favorable toward integration, (b) more strongly identified with "blackness," and (c) more willing to join or participate in a black power movement. "The parents are pro-integrationist, but not pro-black consciousness."—A. R. Howard.

4076. Larue, Janine. **Dix entretiens sur la culture: Quelques hypothèses concernant la composition et la différenciation sociale des représentations.** [Ten interviews on culture: Some hypotheses concerning the composition and social differentiation of representations.] *Journal de Psychologie Normale et Pathologique*, 1970(Jan), Vol. 67(1), 37-69.—Recorded 10 structured interviews, with open-ended responses from people of various socioeconomic levels. The key term was culture. 25 hr. of recordings were systematically analyzed. The following themes emerged concerning culture: it is an object of thinking and reflection; culture is geographically or territorially limited; culture is diversified in time, space, etc.; culture is evolving; culture imposes certain demands, i.e., universality, truth, etc.; culture arouses man; culture serves as a pole of reference and orientation; culture transmits shares, and offers; and culture transforms the individual.—L. A. Ostlund.

4077. Lieberman, Lewis R. (Charles L. Mix Memorial Fund, Inc., Americus, Ga.) **Attitudes toward the mentally ill, knowledge of mental illness, and personal adjustment.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 47-52.—Investigated correlates of attitudes toward the mentally ill. In Exp. I, 121 undergraduates in 3 states were given the Opinions about Mental Illness questionnaire (OMI) and a test of knowledge about mental illness devised by J. C. Nunnally. Results show that Ss were better informed about mental illness than the general population. Also those who were less authoritarian toward the mental patient were better informed than the more authoritarian. In Exp. II, 67 male students were given the OMI and the MMPI. Results show that those who were less authoritarian on the OMI were more deviant on the MMPI.—*Journal abstract*.

4078. Mascaró, Guillermo F. (U. Florida) **Correspondence between evaluative expectations and attitudes.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 115-125.—Explained the concept of attitude (and its measurement) in terms of expectancy-value theory and tested the hypothesis that attitudes are enduring evaluative expectations towards an object. A disguised measure of evaluative expectations on the Vietnam war based on a category-width task, 2 further category width scales on different issues, and 2 attitude measures (a Thurstone and a semantic-differential scale on Vietnam) were administered to 87 male undergraduates. Degree of structure (information) was manipulated in all categorization measures. As predicted, evaluative expectations were significantly related to attitude scores. The structure variable affected relationships among categorization variables but not the relationship between evaluative expectations and attitudes. Also it was found that generalization of categorization tendencies decreased as the attitudinal

relevance of the issue increased. (28 ref.)—*Journal abstract.*

4079. Mol, Hans. (Australian National U., Canberra, Australian Capital Territory) **Religion and sex in Australia.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 105-114.—In a social survey of the states of New South Wales, Victoria and Tasmania religious variables were shown to be related to the sexual attitudes of the respondents. The explanation given is that religion and sex are alternative forms of commitment: religious believers perceive sexual activity differently from non-believers, and perhaps need it less for their personality integration. It is suggested that Christianity has set up strict norms regarding sexual activities and attitudes because sex is seen as a possible threat to its major function. (23 ref.)—*Journal abstract.*

4080. Nordenstreng, Kaarle. (Finnish Broadcasting Co., Helsinki) **Changes in the meaning of semantic differential scales measurement of subject-scale interaction effects.** *Journal of Cross-Cultural Psychology*, 1970(Sep), Vol. 1(3), 217-237.—The concept "work" was rated by 720 Finnish adults and by American and English students and adults. The influence of the Ss' backgrounds were evaluated by transformation analysis. "The results showed that the interaction effects... provide useful information for further interpretation."—A. Krichev.

4081. Sarbin, Theodore R. & Mancuso, James C. (U. California, Santa Cruz) **Failure of a moral enterprise: Attitude of the public toward mental illness.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 159-173.—Presents a critical analysis of published reports on the public's attitudes toward mental illness and toward deviant conduct. The mental health movement fits the defining criteria for a moral crusade, motivated and supported by moral entrepreneurs. The reported data indicate that the mental illness paradigm, as a formula for understanding and controlling deviant conduct, has not been widely accepted by the public. The central objective of the mental health movement has been to influence the general public to regard mental illness with the same nonrejecting valuations as somatic illness. Social survey reports and other data point to the conclusion that the public tends to declare negative (rejecting) valuations on persons diagnosed as mentally ill. However, the public tends to be more tolerant of deviant conduct when it is not described with mental illness labels. (37 ref.)—*Journal abstract.*

4082. Schufletowski, Frank W. & Reed, Robert L. (U. Kansas) **Value structure: Another dimension to attitude measurement?** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 127-129.—Rationales of the various procedures used in attitude scaling have not accounted for the individual's value structure and its relationship to his responses. An approach to differing value structures was the use of an item which indicated the degree of importance the attitude statement had for the respondent. With the employment of Likert and Guttman scaling, no significant difference was found in either technique for capacity to select or reject items on the basis of importance to respondents. The measurement of value structure by the use of the importance continuum should be considered a necessary but not a sufficient condition for item selection. However, an item does not offer much predictive power unless it is a relevant criterion in the value structure of the sample.

—*Author abstract.*

4083. Szalay, Lorand B., Windle, Charles, & Lysne, Dale A. (American U., Center for Research in Social Systems) **Attitude measurement by free verbal associations.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 43-55.—Studied attitudes of various American and foreign student groups (N = 50) as components of the total subjective meaning content reflected by free verbal associations. To measure the attitudinal meaning, indexes of associations with positive and negative connotations were calculated. These indexes for groups were highly correlated with semantic differential evaluations and with responses to direct questions about attitudes. The distribution of associative responses in content categories reveals characteristic differences in cognitive organization between groups with positive and negative attitudes. Comparisons with the direct methods suggest that association-based attitudinal inferences may offer a new type of attitudinal information focusing on the affective-emotional content. (19 ref.)—*Author abstract.*

4084. Treichel, Bruce & Nance, Dale. (U. Wisconsin, Milwaukee) **Attitudes of educated young adults toward child rearing.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 53-54.—Examined whether or not differences existed between 30 educated young men and 46 women in attitudes related to child rearing. Each ranked 50 behavior items for degree of concern using a Q-sort approach. Some differences between the groups were found, although none were statistically significant.

—*Journal abstract.*

4085. Vogel, Susan R., et al. (Worcester State Hosp., Mass.) **Maternal employment and perception of sex roles among college students.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 384-391.—Examined sex-role perceptions held by male and female college students with reference to the students' mothers' employment history. 120 undergraduates rated men, women, and themselves on an inventory of bipolar phrases describing sex-role relevant characteristics. Results of t-test comparisons indicate that both men and women with employed mothers perceive significantly smaller differences between masculine and feminine roles than do men and women with homemaker mothers. The women's perceptions of the sex roles are more strongly influenced by the mother's employment than are the men's perceptions. Maternal employment also tends to raise the estimation of one's own sex concerning those characteristics that are seen as socially desirable for the opposite sex. (15 ref.)—*Journal abstract.*

4086. Wish, Myron; Deutsch, Morton, & Biener, Lois. (Bell Telephone Lab., Murray Hill, N.J.) **Differences in conceptual structures of nations: An exploratory study.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 361-373.—Explored the ways different people conceive of nations, the conditions which give rise to different conceptions of nations. Primary attention is focused on a task in which 75 students from 8 countries, but all studying at a university in the United States, gave pairwise ratings of overall similarity with respect to a set of 21 nations. An INDSCAL analysis, a multidimensional scaling procedure developed by J. D. Carroll and J. J. Chang, of the similarities data revealed 4 dimensions which were interpreted as: political alignment and ideology, economic development, geography and population, and culture and race. Economic development was more important than political alignment to doves, males, and

Ss from developed countries, whereas the opposite was true for nondoves, females, and Ss from underdeveloped countries. Differences in the Ss' conceptions of nations appeared to be of degree rather than kind. (32 ref.)—*Journal abstract.*

Formation & Change

4087. Friedman, Philip H., Buck, Ross, & Allen, Vernon L. (Temple U., Medical School) **Arousal, anxiety, aggression, and attitude change.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 99-108.—Investigated the effects of an aggressive habit and emotional arousal, measured by heart rate, blood pressure and self-report, on 2 types of attitude change. 36 male undergraduates were injected with epinephrine or placebo, and acquired an aggressive or nonaggressive habit. Then Ss read an article attacking teaching machines and were told that the injected "vitamin" would relax them. Results show that psychological arousal was positively related to degree of influence by the "relaxation" communication, but physiological arousal and an aggressive habit were not. Aggressive habit Ss and to a lesser extent physiologically aroused Ss were most influenced by the teaching machine article.—*Journal summary.*

4088. Fromkin, Howard L. (Purdue U.) **Effects of experimentally aroused feelings of undistinctiveness upon valuation of scarce and novel experiences.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 521-529.—Tested the hypothesis that preferences for scarce experiences relative to plentiful experiences will become more pronounced as feelings of undistinctiveness increase, independent of the expected novelty of the experience. 29 male and 30 female undergraduates received bogus test results which described them as either extreme, high, or low in uniqueness, the 1st independent variable. After obtaining test feedback concerning their uniqueness, Ss were informed that they would be able to spend time in 1 of 4 psychedelic chambers. The 4 psychedelic chambers were described as either available or unavailable to others and as producing novel or familiar feelings, the 2nd and 3rd independent variables. Sex of S was also treated as an independent variable. Ss indicated their valuation (the dependent variable) of the 4 different chambers. The hypothesis is confirmed on 3 different measures of valuation. (16 ref.)—*Journal abstract.*

4089. Goldberg, Carlos I. (City Coll., City U. New York) **Attitude change as a function of source credibility, authoritarianism, and message ambiguity.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 464-465.

4090. Holt, Lewis E. (U. Lethbridge, Alberta, Canada) **Resistance to persuasion on explicit beliefs as a function of commitment to and desirability of logically related beliefs.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 583-591.—Tested the anchoring method of increasing resistance to persuasion through the establishment of prior linkages between the belief to be attacked and logically related beliefs. It was hypothesized that the direct impact of a persuasive communication would be inversely related to the degree of resistance to change on the related beliefs. The anchoring strength of the related beliefs was manipulated by employing 2 levels of commitment to the derived conclusions, and by varying the desirability of

the related beliefs. Ss were 83 undergraduates. For the direct impact of the messages, a main effect of desirability was obtained, with Ss for whom undesirable related issues were made salient changing less on the target beliefs. The Desirability \times Commitment interaction was also significant. The main effect of commitment, although in the predicted direction, fell short of conventional levels of significance ($p < .10$). Findings are discussed in terms of consistency and hedonic principles. (28 ref.)—*Journal abstract.*

4091. Sherman, Steven J. (Indiana U.) **Attitudinal effects of unforeseen consequences.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 510-520.—Investigated whether the introduction of previously unforeseen consequences following a counter-attitudinal act can affect the level of dissonance arousal. Exp. I with 70 male undergraduates, indicated that when the initial decision was made freely by Ss, the offer of incentive (whether prior to the decision or fait accompli) reduced subsequent attitude change. Such effects were not observed when the decision involved no choice. In Exp. II with 50 Ss, unforeseen negative consequences increased attitude change, but only under high choice. It is concluded that fait accompli manipulations can affect the level of cognitive dissonance, but only when dissonance previously has been aroused. (20 ref.)—*Journal abstract.*

4092. Stroebe, Wolfgang; Thompson, Vaida D., Insko, Chester A., & Reisman, Stephen R. (U. North Carolina) **Balance and differentiation in the evaluation of linked attitude objects.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 38-47.—Exposed 267 undergraduates to information regarding whether a Dr. M. supported or attacked a theory, married or divorced a wife, was an expert or inexperienced scientist, and was a nice or awful person. Major results indicate a significant overall average tendency for the theory to be evaluated more highly when supported by an expert scientist or attacked by an inexperienced scientist than in the 2 mixed-sign conditions. Similarly, the wife was evaluated more highly when married by a nice person or divorced by an awful person than in the 2 mixed-sign conditions. This general pattern of results was interpreted as indicating that Dr. M. as a scientist was differentiated from Dr. M. as a person. In addition, a significant agreement effect was obtained for both theory evaluation and wife evaluation, and a significant positivity effect for just theory evaluation. Overall theoretical speculation is offered that balance theory could account for all the obtained effects.—*Journal abstract.*

4093. Watts, William A. & Holt, Lewis E. (U. California, Berkeley) **Logical relationships among beliefs and timing as factors in persuasion.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 571-582.—Studied the effects of integration of beliefs, salience of the interrelationships, and time of opinion measurement upon persuasion with 97 undergraduates. Integration of beliefs was manipulated by R. B. Zajonc's cognitive tuning method and salience through presence or absence of a pretest. Opinions were measured either immediately following the communications or after a 10-min delay. The pretest inhibited change in the specific belief attacked ($p < .01$), but had no main effects on the logically related, but unmentioned, beliefs. Ss in the high-integration condition, compared to the low, changed more in the target ($p < .01$) and related ($p < .05$) beliefs and achieved a higher level of internal

consistency among their beliefs ($p < .05$), although the latter was, in part, dependent upon their having been pretested (interaction F ratio = 4.74, $p < .05$). Change in the related beliefs was greater in the delayed than in the immediate-measurement condition ($p < .05$). (15 ref.)—*Journal abstract.*

4095. Wyer, Robert S. (U. Illinois, Chicago Circle) **Quantitative prediction of belief and opinion change: A further test of a subjective probability model.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 559-570.—Tested implications of the hypothesis that relations among beliefs, if defined in terms of subjective probabilities, are predictable by applying the laws of objective probability. Of particular interest was the extent to which change in 1 belief would predictably affect other beliefs which were related to it. 9 hypothetical situations were constructed, each of which pertained to an event (A) and its relation to a 2nd event (B). Descriptions of each situation were presented to 49 undergraduates in 2 parts: the 1st to produce a low estimate of the likelihood of occurrence of A, and the 2nd to increase this estimate. Ss estimated various probabilities associated with occurrence of A and B after reading each part of the communication. Estimates of the probability of B and the change in these estimates after reading the 2nd part of the communication were both predicted accurately by applying the laws of objective probability. These predictions were more accurate than those generated by the 1960 model proposed by W. J. McGuire. Obtained and predicted estimates of the conjunctive and disjunctive probabilities of A and B were also compared. In general, the hypothesis appeared to be of substantial value in generating accurate quantitative descriptions of the relations among beliefs.—*Journal abstract.*

4097. Zimbardo, Philip, et al. (Stanford U.) **Modifying the impact of persuasive communications with external distraction.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 669-680.—Engaging in an irrelevant, distracting activity while simultaneously processing a persuasive communication has a salutary effect upon attitude change if the audience is set to attend primarily to the message, but the opposite effect if they are set toward the distracting activity. The conditions necessary for demonstrating this relationship are sensitive to operational details which were not sufficiently well controlled in previous research (nor in the 1st 2 of 3 studies reported here). Additional results seriously challenge the adequacy of earlier conceptual and empirical treatments of mediators of attitude change, including attention, effort, learning, and counterarguing.—*Journal abstract.*

Influence & Behavior

4098. Diamant, Louis. (U. North Carolina, Charlotte) **Premarital sexual behavior, attitudes, and emotional**

adjustment. *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 75-80.—To examine relationships between premarital sexual behavior, attitudes and emotional adjustment, MMPI's Attitude Scales on Sexual Permissiveness and Sexual Behavior Questionnaires were administered to 54 male and 62 female college students. No relationship was found between adjustment and premarital sexual intercourse for either male or female Ss, nor was any relationship found between the number of partners and adjustment. The possible relationship in males between dissonant context as reflected in low scores on attitude scales on sexual permissiveness and adjustment was also investigated. As hypothesized, low permissiveness scores were related to maladjustment in males.—*Author abstract.*

4099. Dowell, Linus J. (Texas A & M U.) **Comparison of the health attitudes of active and inactive adult men and women.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 209.—Developed a health attitude inventory to compare health attitudes of active ($N = 40$) and inactive ($N = 40$) adult men and women. It was found that active men possess a more favorable attitude toward physical activity than inactive men, while active women possess a more positive attitude toward use of drugs than inactive women. In general, active adults have a more positive attitude toward physical activity and have a better total health attitude than do inactive adults.—*Author abstract.*

4100. Jamieson, Bruce D. (U. Canterbury, Christchurch, New Zealand) **Attitude, plausibility, and the learning and recall of controversial material.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 169-174.—Tested the effects of attitude and plausibility upon the learning and recall of controversial religious material with groups of pro-Catholic and anti-Catholic Ss. The finding of previous studies, that Ss learn plausible pro- and implausible antistatements more easily than implausible pro- and plausible antistatements was confirmed for pro-Catholic Ss but not for anti-Catholic Ss. A similar result was obtained when recall data were analyzed.—*Author abstract.*

4101. Rosen, Alexander C. (U. California, Neuropsychiatric Inst., Los Angeles) **Changes in the perception of mental illness and mental health.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 203-208.—Investigated changes in the perception of models of mental illness and mental health on the responses to a 25 item semantic differential scale in groups of Ss in a course in abnormal psychology ($N = 34$) and in several encounter-sensitivity training groups ($N = 139$). Test findings before and after the experience indicate that the participative emotional experience and intellectual cognitive experiences did not modify abstract models held by individuals concerning mental illness and normality. These findings have implications for community mental health services. Placing greater emphasis on direct community services and less emphasis on public education and public information is suggested.—*Journal abstract.*

4102. Warner, Lyle G. & DeFleur, Melvin L. (Washington State U.) **Attitude as an interactional concept: Social constraint and social distance as intervening variables between attitudes and action.** *American Sociological Review*, 1969(Apr), Vol. 34(2), 153-169.—Investigates the effect of selected situational variables on the relationship between a verbal attitude and overt behavior toward the object of that attitude. Data suggest

reformulation of 2 theoretical schemes describing the relationship between prejudice, discrimination, and the situation of action. In a relatively large-scale field experiment in a university setting, 2 multidimensional factors, social constraint and social distance, were systematically introduced as intervening conditions to assess the degree to which they reduced correspondence between verbal attitudes toward Negroes and overt acts of acceptance or rejection of Negroes. Generally, these intervening factors had different mediating influences on different types of Ss. (26 ref.)—*Journal abstract*.

4106. Baxter, James C. & Deanovich, Bettye F. (U. Houston) **Anxiety arousing effects of inappropriate crowding.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 174-178.—Evaluated the anxiety arousing effects of inappropriate crowding in a dyadic experimental setting. 48 female undergraduates were presented 8 Make A Picture Story test settings, containing 2 doll figures accompanied by a brief narrative describing the situation. Ss rated the amount of dysphoria they believed the female figure would feel in each setting. Ss were run under either an inappropriately crowded or appropriately spaced seating arrangement. Results indicate that crowded Ss projected more anxiety in their ratings of the figures than did the uncrowded Ss, with the effects becoming more pronounced during the latter 1/2 of the experimental period. (22 ref.)—*Journal abstract*.

4107. Bishop, Doyle W. & Witt, Peter A. (U. Illinois) **Sources of behavioral variance during leisure time.** *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 352-360.—2 samples of 49 and 91 undergraduates rated how much they would feel like participating in each of a set of leisure activities in each of 10 hypothetical situations. The resulting matrices of responses were analyzed into the estimated variance components associated with persons, situations, modes of response, and their various interactions. These sources of variance in leisure behavior were compared to those reported by N. S. Endler and J. Hunt for hostility and anxiety. The results show major differences between the relative contributions of the sources of variance to leisure behavior and their contributions to hostility and anxiety. There were also some differences between the sexes in sources of variance, both within and across the 3 domains of behavior. In addition, the implications of 2 classical views of leisure behavior were tested by comparing the Persons \times Modes of Response and Situations \times Modes of Response interaction variances. Results support both views, although sex differences suggest that these classical views might be differentially applicable to males and females.—*Journal abstract*.

4121. Kelley, H. H., et al. (U. California, Los Angeles) **A comparative experimental study of negotiation behavior.** *Journal of Personality and Social Psychology*, 1970(Nov), Vol. 16(3), 411-438.—Studied interpersonal negotiation at 8 laboratories, 3 in Europe and 5 in the United States. The negotiation task was designed to investigate the various ways in which persons deal with a mixed-motive, incomplete-information problem which involved both distributive and integrative bargaining. Results for the 3 independent variables show that: (a) increasing the difficulty of the bargaining problem, increased trial time and reduced frequency of agreement; (b) in a comparison of money and points incentives, the former had positive effects on the negotiation, both in terms of preinteraction attitudes and in terms of subsequent interaction and negotiation outcomes; and (c) the creation in 1 condition of an unequal dependence of the 2 parties upon agreement did not have the anticipated disruptive effect upon the interaction. Analysis of differences among the sets of data from the 8 research sites suggests that the negotiation situation was defined in 2 ways. This was reflected in different meanings given to the dimension of cooperation vs. competition in the interaction. At some sites, this dimension was given an evaluative meaning—good vs. bad; at other sites, it was given a dynamism meaning—weak and passive vs. strong and active. These 2 meanings had different implications for the process and outcomes of the negotiation and for the relation between the Ss' pregame attitudes and their subsequent behavior. 4123. Langelar, J. W. (Rijks Psychologische Dienst, Hague, Netherlands) **Is "brainstorming" werkelijk effectief?** [Is brainstorming really effective?] *Mens en Onderneming*, 1970(May), Vol. 24(3), 194-201.—Identifies desirable outcomes of brainstorming by a group:

(a) the development of new ideas, (b) the examination of new ideas, (c) the possibility of creating new ideas, and (d) the harmonization of the new ideas. Ss were 48 students in psychology, divided into a nominal and a working group. Nominal Ss worked individually and working Ss worked in 4 groups of 4 Ss each and in 2 groups of 8 Ss each. The results from the nominal group were tabulated into 4 Ss each in 4 groups. Problems discussed were (a) what means could a hotel manager employ if a surplus of guests should arrive, and (b) what can be done to increase traffic safety. Time limit was 30 min. Nominal Ss made significantly more suggestions at the .01 level. Also, the quality of the suggestions were appraised independently by professors from a hotel management school and from a traffic education school, respectively. The nominal group was superior in quality of suggestions. No difference was apparent between the sizes of the working groups with respect to the quantity and quality of the suggestions. Based on the results, the value of brainstorming is questionable.—*A. J. Ter Keursl.*

4124. Lebedun, Morty. (Mid-Missouri Mental Health Center, Columbia) **A technique for insuring good group attendance.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 138.—Persons wishing to attend a "smoker's" discussion group were required to provide a refundable deposit of \$20, of which \$5 would be deducted for every absence from a group session. 11 Ss met for 6 weekly sessions. Only 2 absences (4%) occurred with this approach.—*P. McMillan.*

4125. Loomis, Charles P. (Michigan State U.) **Wanted: A model for understanding and predicting change in natural and therapeutic groups and systems which are Gemeinschaft-like.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 131-136.—Bargaining, conflict, and game theories do not have the universal applications which analysts of the free world would have us believe. Models and procedures are needed which will explain the Gemeinschaft-like activity so that more perfect individuals and groups can be created.—*A. Krichew.*

4126. Marlatt, G. Alan. (U. Wisconsin) **A comparison of vicarious and direct reinforcement control of verbal behavior in an interview setting.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 695-703.—96 undergraduates were assigned to 3 experimental groups and 1 control group for the vicarious reinforcement variable. Ss were 1st exposed to a tape-recorded model, which described personal problems to an interviewer. Vicarious reinforcement was either positive, neutral, or negative; controls did not receive the model. For the test interview, Ss were assigned to 1 of 3 identical direct reinforcement conditions for their discussion of problems. Results show that all Ss who observed the model gave significantly more problems in the test interview than did control Ss. Both vicarious and direct reinforcement treatments were significant, but the vicarious condition produced the greatest effect (positive > neutral > negative). In a 2nd extinction interview, given 1 wk. later, only vicarious reinforcement remained a significant factor. Results are interpreted within a theoretical framework highlighting the information (instructional) aspects of verbal reinforcement. (17 ref.)—*Journal abstract.*

4127. Mausner, Bernard & Graham, Judith. (Beaver Coll.) **Field dependence and prior reinforcement as determinants of social interaction in judgment.**

Journal of Personality & Social Psychology, 1970(Nov), Vol. 16(3), 486-493.—Examined the relation of 1 situational manipulation and 2 measures of individual characteristics of the S, anxiety and field dependence, to behavior in a social interaction. 36 male high school Ss made judgments of rate of alternation of flickering light, 1st as ratings and then as absolute judgments. In the rating series each S was either positively or negatively reinforced and observed a fellow S receive a schedule of reinforcement opposite to his own. There were no main effects; neither the manipulation of prior reinforcement nor the measures of individual differences were associated with convergence by the S toward purportedly different judgments made by the fellow S. There was a significant interaction between prior reinforcement and field dependency. Field-dependent Ss responded in accordance with prior reinforcement; field-independent Ss did not. (Hope Coll.) **Responsibility diffusion and drive enhancement effects on risky shift.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 418-425.—Small group discussion produced expected risky and cautious shifts on choice dilemma items. It was predicted from responsibility diffusion theory that, compared with low-anxious, high-defensive groups, high-anxious, low-defensive groups produce greater risky shift. It was predicted from drive enhancement theory that, compared with low-anxious groups, high-anxious groups produce greater risky shift on risk-dominant items and greater cautious shift on caution-dominant items. The results of 2 experiments failed to confirm either interpretation. Significant shifts were obtained in a control condition. (19 ref.)—*Journal summary*.

4131. Nemeth, Charlan. (U. Chicago) **Bargaining and reciprocity.** *Psychological Bulletin*, 1970(Nov), Vol. 74(5), 297-308.—Numerous studies in the area of bargaining have attempted to raise the usual low level of cooperation between players by programing 1 person's play as cooperative. Implicit in the design of such studies is a notion of reciprocity, i.e., that Ss will feel obligated to return benefits. The failure of such attempts to raise the level of cooperation suggests an apparent contradiction between the norm of reciprocity, which is postulated as a universal norm, and findings of the bargaining studies which show little or no reciprocity. An attempt is made to resolve such a contradiction by addressing several variables intrinsic to the particular paradigm used in the bargaining studies. A selective review of the 2 literatures suggests that such variables intrinsic to the paradigms all operate in such a way as to inhibit a norm of reciprocity, and indeed help giving in general. It is concluded that the lack of reciprocity typically found in bargaining games is not because reciprocity is inoperative, but is rather due to the paradigms normally employed for the study of cooperation and competition. 4133. Northway, Mary L. **What is sociometry?** *Group Psychotherapy*, 1968, Vol. 21(2-3), 110-112.—Postulates that there are basic laws to social groupings and that these laws can be discovered through more refined uses of the basic Moreno sociogram.—*A. Krichev*.

4134. Peabody, Dean. (Swarthmore Coll.) **Symmetry and asymmetry in interpersonal relations: With implications for the concept of projection.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 426-434.—Interpersonal relations tend to be "symmetrical" or "asymmetrical," i.e., involve similar or dissimilar characteristics for the 2 parties, depending on the characteristics. Certain characteristics (e.g., love-hate) are, and are perceived to be, symmetrical, and others (e.g., dominance-submission) asymmetrical. A process of attributing to others characteristics that "explain" one's own would account for symmetrical projection for certain characteristics and asymmetrical projection for others. This reformulation can provide a simpler and more unified account for cases that are traditionally treated separately as "supplementary" and "complimentary" projection. (17 ref.)—*Journal summary*.

4135. Peters, David R. (U. California, Graduate School of Business Administration, Los Angeles) **Self-ideal congruence as a function of human relations training.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 199-207.—Examined the phenomenal self, and self-regard of 57 participants undergoing an intensive 2-wk human relations (laboratory) training program, using a 49-scale semantic differential instrument. Results indicate increases in participants' self-ideal congruence which were significant in 4 of the 6 T-groups, and in contrast to a comparison group of students in a human behavior seminar. Results were then compared and integrated with earlier conflicting studies. However, the increases in self-regard were not related to either outcome criteria of overall personal learning and change during the laboratory raising questions about (a) the validity of a self-ideal change index among normals, and (b) the sole reliance upon self-concept measures in assessing change. (23 ref.)—*Author abstract*.

4136. Pierce, Robert A. (U. Rochester, School of Medicine & Dentistry) **Need similarity and complementarity as determinants of friendship choice.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 231-238.—39 pairs of mutual-choice friends filled out the Jackson Personality Research Form A prior to becoming acquainted. A small but real effect of needs on friendship choice was demonstrated and the needs most relevant to friendship choice were isolated. Factors of "order vs. impulsivity," and "turning toward people vs. turning away from or against people" were found to be related to dyad formation, while factors relating to achievement, dominance, and understanding were found to be irrelevant. The 2 hypotheses previously advanced to explain the relation of needs to friendship choice were examined in the light of these data and the similarity hypothesis was found to be a more accurate predictor than the complementarity hypothesis. 4142. Wyer, Robert S. & Lyon, John D. (U. Illinois, Chicago Circle) **A test of cognitive balance theory implications for social inference processes.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 598-618.—95 undergraduates inferred the likelihood of positive, neutral, and negative relations between elements in a triad both in the absence of prior information about other relations involving these elements and in the context of various information combinations differing in their affective quality. The stability of a situation in which the 3 relations occurred was also estimated. Data obtained in the absence of knowledge about other relations in the triad were used as norms relative to which inferences and stability ratings in the context of various relations were compared. When Ss were asked to infer all 3 of the relations in a triad, balanced sets generally occurred more frequently than would be expected by chances, but imbalanced relations did not occur less frequently than expected. Inferences under these conditions appeared to be primarily affected by a tendency to construct sets of relations that were similar to one another in affective quality. When Ss were asked to infer the 3rd relation in a triad given knowledge of the other 2 relations, balance theory was consistently supported only when the context consisted of 1 positive and 1 negative relation. In the context of 2 negative relations, results were frequently opposite to those predicted by balance theory. Results were often contingent upon both the type of elements (persons or objects) in the configuration and the type of inference required. However, the nature of these contingencies varied over context conditions. Stability ratings generally paralleled inference data. Results are taken as generally nonsupportive of balance theory. An alternative approach to the study of social inference processes is suggested. (21 ref.)—*Journal abstract.*

Influence & Communication

4143. Bhushan, L. I. (Bhagalpur U., India) **A scale of leadership preference.** *Psychological Studies*, 1969, Vol. 14(1), 28-34.—Reports the construction and standardization of a Likert-type 5-point scale to measure democratic and authoritarian leadership preferences. The final instrument consists of 30 items with percentile norms, and means and standard deviations based on 400 college students. Coefficient of internal consistency computed from the responses of 100 students was .74, and a retest reliability after 4 wk. on 50 Ss is reported as .79. Content and construct validity were used for validation. Item analysis is described in detail.—*U. Pareek.*

4144. Blake, Brian F. & Tesser, Abraham. (Purdue U.)

Interpersonal attraction as a function of the other's reward value to the person. *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 67-74.—Based upon a theory of interpersonal rewards, hypotheses were offered about the effects of 4 factors upon an S's attraction to an O: the importance of the interaction between S and O to S, S's control over O, the extent to which O complied with S's influence attempt, and O's attraction to S. 64 males took part in a simulated "management game" in which they were to influence 2 bogus subordinates. It was found that the effects of the independent variables were dependent upon the dimension on which the S evaluated the O. Results are discussed in terms of social comparison theory.—*Author abstract.*

4145. Glinski, Richard J., Glinski, Bernice C., & Slatin, Gerald T. (U. California, Graduate School of Education, Los Angeles) **Nonnaivety contamination in conformity experiments: Sources, effects, and implications for control.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 478-485.—By means of an expanded R. J. Crutchfield apparatus, 55 undergraduates were processed in 2 sessions of a conformity experiment designed to explore the sources and effects of S nonnaivety. Nonnaivety was found to originate in the preexperimental, intra- and intersession periods, and to derive, respectively, from prior knowledge, characteristics of the apparatus, task, and experimentally created group, and intersession contamination by previous Ss. Nonnaive Ss exhibited significantly less conformity than naive ones. Intersession contamination distorted the results of the conformity experiment.—*Journal abstract.*

4146. Lupfer, Michael. (Memphis State U.) **The effects of risk-taking tendencies and incentive conditions on the performance of investment groups.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 135-136.—A total of 36 3-member teams met for 6 sessions to play a modified version of the Project SOBIG Stock Market Game. Teams differed in their risk-taking disposition (either low-, moderate- or high-risk; 1/3 of the teams invested their own money; 1/3 were given money to invest. Teams of differing risk-taking disposition did not utilize different investment strategies. Teams investing their own money (a) transacted fewer lots of stock, (b) requested more market information, (c) accumulated a larger profit, and (d) exhibited a less stable influence hierarchy than teams investing another's money.—*Author abstract.*

4147. Mulder, Mauk & Wilke, Henk. (Utrecht U., Inst. of Social Psychology, Netherlands) **Participation and power equalization.** *Organizational Behavior & Human Performance*, 1970(Sep), Vol. 5(5), 430-448.—Criticizes the belief that participation in decision making will result in power equalization between "haves" and "have-nots." It is hypothesized that when great differences exist in the expert power (availability of relevant information) of group members, the participation process will provide the more powerful persons with greater opportunities for using their power, resulting in greater effective influence on the less powerful. An experiment was designed in which 2 variations of Other's expert power and 2 variations of S's extent of participation with Other (Other being a paper stooge) were manipulated. Measures included pre- and postmeasures of S's preference for a certain solution of a complex problem. E could determine whether or not S had changed his initial point of view to one similar to that advanced by Other and could discover S's reactions to

Other and to the influence process. 2 hypotheses were tested: (a) a higher degree of expert power of Other will result in more effective influence by Other on S than lower expert power; and (b) the more expert power possessed by Other, and the greater the extent of S's participation with Other in the decision-making processes, the greater Other's effective influence on S. Both hypotheses were strongly supported. The relevance of the tested theory and of other empirical data for "democratization processes" is discussed. (37 ref.)—*Journal abstract.*

4148. Napier, Herman S. (U. Arkansas) **Group learning: Divided task information and response capability.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 175-180.—Performed 2 experiments to test hypotheses developed from a simplified group learning model. Results support the view that both divided task information and response capability significantly reduce group effectiveness, particularly in the early stages of group development. The possibility was offered that this reduction may be due to a loss in communication and information gathering potential rather than the simple result of a reduction in physical response capability.—*Author abstract.*

4149. Rounow, Ralph L. (Temple U.) **Adding and averaging effects in impression formation as a function of the situational context.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 127-135.—66 male and 66 female undergraduates made comparative judgments of paired sets of simultaneously presented income stimuli. The pairs were constructed so that the sum of the values was higher in 1 set than in the other, while the mean income was simultaneously higher in the latter set than in the former. When the incomes within a set were represented as all belonging to the same person or when the incomes were attributed to different members of a family, both men and women tended to rate higher in economic status whichever sets of stimuli had the higher sums in direct relation to the manipulated discrepancy between sums. When the same stimuli were attributed to different members of a group, both sexes rated higher in economic status whichever sets had the higher arithmetic mean values in direct relation to the manipulated discrepancy between arithmetic means. The significance of this finding is in demonstrating that the stimulus-combination rule in impression formation is at least partially predicated upon situational determinants and that neither simple summation nor simple averaging is an exclusively valid or invalid combinatory principle. (35 ref.)—*Journal abstract.*

4150. Solomon, Arthur; Perry, Steven, & Devine, Robert. (Antioch Coll.) **Interpersonal communication: A cross-disciplinary approach.** Springfield, Ill.: Charles C. Thomas, 1970. vii, 108 p. \$8.50.

4151. Stricker, Lawrence J., Messick, Samuel, & Jackson, Douglas N. (Educational Testing Service, Div. of Psychological Studies, Princeton, N.J.) **Conformity, anticonformity, and independence: Their dimensionality and generality.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 494-507.—Examined the dimensionality of responses of high school students to group pressure and its generality across procedures employing different kinds of social situations and experimental tasks. 2 group pressure procedures were based on the Asch situation (counting clicks and responding to attitude items), and 2 others involved questionnaires with fictitious average answers (estimat-

ing probabilities of events and responding to attitude items). Conformity, anticonformity, and independence responses on each of these 4 procedures were factor analyzed, separately for Ss unsuspicious (N = 43) about the deceptions employed in these devices and for suspicious Ss (N = 67). Conformity and anticonformity appeared to represent 1 bipolar dimension, and conformity and independence seemed to involve another bipolar dimension. These responses were not consistent across procedures; the devices functioned differently, particularly for unsuspicious Ss. (61 ref.)—*Journal abstract.*

4152. Willis, Richard H. (U. Pittsburgh) **The conscientious cartographers: A fable inspired by Stricker, Messick, and Jackson.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 508-509.—Presents a mythical illustration to demonstrate the necessity for distinguishing between Cartesian coordinates and test (or score) vectors, with special reference to an interpretation given by L. J. Stricker, S. Messick, and D. N. Jackson (see PA, Vol. 45:Issue 3) to R. H. Willis' diamond model of conformity and nonconformity. A reply by Stricker, Messick, and Jackson follows.—*Journal abstract.*

4153. Willis, Richard H. & Willis, Yolanda A. (U. Pittsburgh) **Role playing versus deception: An experimental comparison.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 472-477.—Ran 96 male and female undergraduates in 6 replications of a 2^d design. Independent variables were level of disclosure (deception vs. role playing), perceived relative task competence, instructional set, and sex of Ss. The dependent variable was net conformity. Data were analyzed as 2 separate 2³ subexperiments. An obvious main effect exhibited by deceived Ss was nicely duplicated by the role-playing Ss. However, a more subtle interaction effect, also clearly exhibited by deceived Ss, was not apparent in any degree in the behavior of role-playing Ss. (21 ref.)—*Journal abstract.*

Social Perception & Motivation

4154. Bartel, Helmut W. (Indiana U.) **Attributions of ability and motivation in person perception and the locus of control of the perceiver.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 462.

4155. Berkowitz, Leonard. (U. Wisconsin) **Aggressive humor as a stimulus to aggressive responses.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 710-717.—To test the notion that the witnessing of aggressive humor can produce a cathartic purge of the O's aggressive inclinations, 80 female undergraduates were 1st either angered or not aroused by having them hear a job applicant's statements about university women. In a factorial design, Ss then listened to a 4-min tape recording, either of a nonhostile or a hostile comedian. When Ss rated the job applicant on several measures immediately afterwards, knowing their comments might affect the applicant's chances of getting the job, the women who had heard the aggressive humor were more aggressive toward the applicant than were the women who had listened to the neutral humor. Several other studies purporting to demonstrate the cathartic influence of aggressive humor are discussed. (19 ref.)—*Journal abstract.*

4156. Boulware, Donald W. & Holmes, David S. (Community Mental Health Services, Flint, Mich.)

Preferences for therapists and related expectancies. *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 269-277.—60 male and 60 female undergraduates were shown slides of the faces of potential therapists, older males, younger males, older females, and younger females. Ss indicated how much they would like to talk to each individual if they had a personal or vocational problem. They also indicated how they thought each therapist would act in a discussion and what each was like as a person. Older males were the preferred therapists in all cases except for women with personal problems who tended to prefer older women. Preferences seemed to be related to high expectancies on therapy relevant variables, especially understanding, rather than to similarity to the students. Students' social classes and parent-child relationships were not related to preferences. (23 ref.)—*Journal abstract*.

4157. de Mille, Richard. (General Research Corp., Santa Barbara, Calif.) **Logical and empirical oppositeness in value responses.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 143-154.—Analyzed free value responses from 555 Ss in 16 domestic and foreign samples to see whether good and bad behaviors named by Ss would fall into logically opposite categories and whether logically opposite categories would be correlated across the numbers of Ss represented in them. It is concluded that free responses about good behaviors should not be mixed with those about bad behaviors, because good and bad are not necessarily empirical opposites even when they are logical opposites. (15 ref.)—*Journal abstract*.

4158. DiStefano, Joseph J. (Cornell U.) **Interpersonal perceptions of field independent and field dependent teachers and students.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 463-464.

4159. Doise, Willem. **Les stratégies de jeu à l'intérieur et entre des groupes de nationalité différente.** [Interplay strategies internally and between groups of different nationalities.] *Bulletin Centre d'Études et Recherches Psychotechniques*, 1969(Jan), Vol. 18(1), 13-26. Attempted to verify the theory that: (a) the temporary belonging to 2 groups of conflicting interaction may coincide with previous belonging to different social groups, and (b) the discrimination toward the other group will be greater than in the case where no previous ties exist, and in the case where these ties are again present within the temporary interest group. A non-O situation within and between couples composed of young French and German Ss was employed. A discrimination was consistently observed toward the other couple on the behavioral level and on the level of the projection of expressed motivations and expectations. Behavioral discrimination was most pronounced when the 2 couples were of different nationality. (Spanish summary)—*English summary*.

4160. Duflos, André; Zaleska, Maryla, & Desportes, Jean P. (Centre National de la Recherche Scientifique, Paris, France) **La facilitation sociale: Un vieux problème toujours sans solution.** [Social facilitation: An old problem remaining without solution.] *Bulletin Centre d'Études et Recherches Psychotechniques*, 1969(Jan), Vol. 18(1), 27-42.—Compares the influence exerted by individuals and by interference activity on the performance of 14 male and 46 female isolated, observed, and perturbed undergraduates who were required to recall nonsense syllable words. Results failed to support Zajonc's hypothesis of increased drive level and

of perturbation produced by the presence of other individuals. The lack of validity of Zajonc's hypothesis is discussed. (Spanish & English summaries) (15 ref.)—*B. A. Stanton*.

4161. Halcomb, Charles G., McFarland, Barry P., & Waag, Wayne L. (Texas Technical Coll.) **Motivation and the human monitor: II. Source of instructions.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 145-146.—Tested the hypothesis that Ss identifying with or having high admiration for E would perform better in a vigilance task than control Ss to which E was unknown. Results from 24 undergraduates are insufficient to support the prediction, but it is hypothesized that this failure may be due to the original level of motivation of the individual Ss.—*Journal abstract*.

4162. Hamilton, David L., Thompson, John J., & White, Andrew M. (Yale U.) **Role of awareness and intentions in observational learning.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 689-694.—37 male undergraduates observed confederates in a verbal conditioning experiment. The E either gave social reinforcement whenever a confederate used a critical word category (models-reinforced condition) or gave no reinforcements at all (models-not-reinforced condition). Significant pre- to postobservation performance changes were found only for Ss in the models-reinforced condition who (a) were aware of the contingency between models' responses and E's reinforcements, and (b) expressed a positive intention to imitate the models' behavior. Alternative theoretical interpretations of the data are discussed.—*Journal abstract*.

4163. Hartnett, John J., Bailey, Kent G., & Gibson, Frank W. (Virginia Commonwealth U.) **Personal space as influenced by sex and type of movement.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 139-144.—Concentrated on sex-of-S, sex-of-object, and type of movement on personal space behavior. 64 undergraduates served as Ss. The distance measures were based on S movement toward the object person and the object person's movement toward the S. The type of movement variable was significant, showing that Ss, especially the females, allowed the object person to move closer to them than vice versa. Correlations between the opposite-sex movement conditions and a measure of heterosexuality showed a slight trend for smaller distances to be associated with high heterosexuality. The highest correlation was obtained on the female object approaching the male S condition. It is concluded that the obtained personal space behaviors are best interpreted in terms of sex-role factors rather than any "human territorial" concept.—*Author abstract*.

4164. Henshel, Richard L. (Cornell U.) **Early impressions in the perception of persons: The effects of cue presentation time and sequence upon group structure and personality.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5524.

4165. Houston, B. Kent & Hodges, William F. (U. Kansas) **Situational denial and performance under stress.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 726-730. Reanalyzed the data for 2 stress groups of 54 undergraduates each from a previously conducted experiment by W. F. Hodges (see PA, Vol. 42, 8262) 3 coping groups, denial, neutral, and accentuator, were defined on the basis of discrepancies between self-report and physiological measures of stress. As predicted, Ss in the denial group performed better

under stress than Ss in the accentuator group, and Ss in the neutral group performed in a manner intermediate between the other 2. Differences between this study and studies in which defensiveness was measured by questionnaires are discussed, as are possible reasons why Ss in the accentuator group seem to be particularly vulnerable to adverse effects of stress. (16 ref.)—*Journal abstract*.

4166. Kohn, Paul; Waxer, Peter; Baumanis, Kyle, & Ruggles, Robin. (York U., Toronto, Ontario, Canada) **Person comparison and the set-size effect in impression formation.** *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 307-321.—Exp. I with 46 undergraduates, and 2 replications with an independent-groups design failed to demonstrate a set-size effect. Subsequent experiments explored the roles of person comparison and demand characteristics in the set-size effect. Exp. II, with 84 Ss, showed a highly significant, largely linear set-size effect for simultaneous exposure to several sketches, but not for exposure to a single sketch. In Exp. III, with 98 Ss, which featured successive exposure to several sketches, significant linear set-size effects were obtained in the target-1st and -2nd conditions; however, the significant set-size effect for target-3rd was quadratic. Dry-run simulations of Exp. II and III, respectively, failed to support a demand-characteristic interpretation. It is concluded that the magnitude and form of set-size effects depend on (a) whether person comparison is available, and (b) whether the comparative information is exposed simultaneously or successively. (French summary) (25 ref.)—*Journal abstract*.

4167. Podd, Marvin H., Marcia, James E., & Rubin, Barry M. (State U. New York, Psychological Clinic, Buffalo) **The effects of ego identity and partner perception on a Prisoner's Dilemma game.** *Journal of Social Psychology*, 1970(Oct), Vol. 82(1), 117-126.—Interviewed 56 male and 56 female undergraduates to determine their identity status, and then played a Prisoner's Dilemma game with either a high or low authority opponent under feedback that changed either from cooperation to competition or from competition to cooperation. Moratorium (in crisis) Ss cooperated less with high than low authority opponents—interpreted as rebellion—and also matched their responses to their opponents' more often than the other statuses (interpreted as need for guidance in decision-making). Moratoriums' high anxiety manifested itself in longer response latencies under increasing competition. Partner perception as high as opposed to low authority yielded significantly longer response latencies. A previously established order effect was replicated and then shown to be accounted for primarily by the moratoriums. (27 ref.)—*Author abstract*.

4168. Rosenberg, Seymour & Olshan, Karen. (Rutgers State U.) **Evaluative and descriptive aspects in personality perception.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 619-626.—Investigated the dimensions underlying person perception, with special attention given to the evaluative dimension. Each of 30 undergraduates described approximately 10 individuals he knew by assigning a subset of 60 personality traits to each individual. The traits supplied to the Ss in this trait-sorting task were selected from a trait-inference study by D. Peabody. The 60 traits were scaled by J. B. Kruskal's program, with a cooccurrence measure for each pair of traits serving as input data. Linear multiple regression was then used to locate an axis in the

3-dimensional space for each of 9 independently rated properties of the traits; 3 of these properties are evaluative. The correlations between each of the 9 properties and the trait space are all at least .75 and are all significant beyond the .001 level. A scoring artifact was discovered in Peabody's data analysis, which accounts for the absence of an evaluative dimension in his study. A reanalysis of his data with artifact removed reveals the presence of a strong evaluative dimension, independent of any particular descriptive dimension. The reanalysis is consistent with the trait-sorting results and with previously published findings by other investigators. (15 ref.)—*Journal abstract*.

4169. Soucar, Emil. (Temple U.) **Students' perceptions of liked and disliked teachers.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 19-24.—Investigated 50 high school seniors' perceptions of liked and disliked teachers, using a variation of Kelly's Repertory Test. It was predicted that disliked teachers would be differentiated more than liked teachers and that female Ss would differentiate more among disliked teachers than would male Ss. For the total sample, negatively valued persons were differentiated more than positively valued persons, but there were no significant sex differences with regard to negatively valued persons. Male Ss differentiated all teachers, irrespective of value, significantly more than female Ss did. The significant difference between liked and disliked teachers supports the vigilance hypothesis suggested by H. Miller and J. Bieri. There was no readily apparent explanation why male Ss were more cognitively complex than female Ss. That male Ss designated more male than female teachers as both liked and disliked is discussed.—*Journal abstract*.

COMMUNICATION

4171. MacKay, Donald M. (U. Keele, England) **Information, mechanism and meaning.** Cambridge, Mass: Massachusetts Inst. of Technology Press, 1969. viii, 196 p. \$2.95(paper).

4172. McGuigan, F. J. (Hollins Coll.) **Covert oral behavior during the silent performance of language tasks.** *Psychological Bulletin*, 1970(Nov), Vol. 74(5), 309-326.—Summarizes and evaluates research in which covert oral responses were recorded. In early studies mechanical sensing devices were used while later research has exclusively employed EMG. 3 major criteria were used in evaluating research on the silent performance of language ("thinking") tasks, leading to the following conclusions: (a) covert oral behavior significantly increases over base line; (b) increased covert oral behavior is accompanied by increased respiration rate and increased amplitude of EMGs in the preferred (writing) arm, but appears to be relatively independent of other nonoral behavior; and (c) covert oral behavior does not appear to typically increase during the performance of nonlanguage tasks. A set of 5 directly relevant findings leads to the conclusion that covert oral behavior during the silent performance of language tasks serves a language function; mediational theories, built on overt behavior, help to suggest more precisely that the covert oral response facilitates the reception of external language stimuli and the internal processing of that

information. Physiological considerations indicate complex and rapid feedback loops between speech regions of the brain and the speech musculature. These loops may function in the process of internal communication. (53 ref.)—*Journal abstract.*

4173. Mehrabian, Albert. (U. California, Los Angeles) **A semantic space for nonverbal behavior.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 248-257.—Reviews evidence relevant to the conceptualization of the referents of nonverbal behavior. 3 dimensions seem to evolve consistently from studies of both verbal and nonverbal behavior to account for the bulk of the variability of the referents. These are evaluation; potency or status, and responsiveness. Increases in positive evaluation are denoted by immediate positions and postures (e.g., a closer position, more forward lean, more eye contact, and more direct orientation); increases in potency or status are denoted by greater degrees of postural relaxation; and increases in responsiveness by greater activity (e.g., facial activity, speech intonation, or speech rate). (36 ref.)—*Journal abstract.*

Language

4175. Bradshaw, John L. (Monash U., Clayton, Victoria, Australia) **Phonetic homogeneity and articulatory lengthening.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 499-507.—Performed 2 experiments with 20 undergraduates to determine the extent of increase in articulation times with nonsense words containing strings of phonetically similar consonants, compared with when the successive consonants belonged to different articulatory categories. An average increase in excess of 33% was found even when stuttering and other speech prolongations were controlled. This figure exceeded the increase in articulation times obtained under delayed auditory feedback. The absence of an interaction between the latter and the degree of articulatory difficulty of the material was considered consistent with a motor hypothesis, rather than with a model emphasizing such sensory effects as feedback or trace monitoring. Articulation is considered as a complex motor skill subject to such phenomena as interference between components and process overlap.—*Journal abstract.*

4176. Brislin, Richard W. (Penn State U.) **Back-translation for cross-cultural research.** *Journal of Cross-Cultural Psychology*, 1970(Sep), Vol. 1(3), 185-216.—Translation or back-translation of 6 essays with 3 content areas and 2 levels of difficulty were performed by 94 bilinguals representing 10 languages. Content, difficulty, language, and content-language interaction all significantly affected translation quality. (35 ref.)—*A. Krichew.*

4177. Coston, Gale N. (U. Georgia) **A study of the effects of omissions and substitutions of selected consonants on intelligibility.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 433.

4178. Gougenheim, G. **Modalités et modes verbaux en français.** [Verbal modalities and modes in French.] *Journal de Psychologie Normale et Pathologique*, 1970(Jan), Vol. 67(1), 7-17.—Presents a historical resumé of French literature, including plays, poems, and novels

which provides examples to point out various usages of style from a technical, grammatical viewpoint. It is concluded that the system of expression of modalities appears much more complex than believed, and that the idea of a "verbal mode" is neither clear nor homogeneous.—*L. A. Ostlund.*

4179. Heise, David R. (Queens Coll., City U. New York) **Potency dynamics in simple sentences.** *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 48-54.—Reports a study to develop prediction equations for potency. Results from ratings by 90 undergraduates show that original impressions of potency associated with words combine in predictable ways when the words are entered into sentences. The subject of the sentence takes on the potency characteristic of the verb and object, whereas the object word takes on some characteristics of the subject and verb, but also is reduced in potency merely by virtue of its object position.—*Journal abstract.*

4180. Huttar, George L. (Speech Communications Research Lab., Santa Barbara, Calif.) **Relations between prosodic variables and emotions in normal American English utterances.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 481-487.—The emotional states of an adult male American speaker, as reflected in 30 utterances, were evaluated by 12 Ss on 9 7-point semantic differential scales. Ss also evaluated the utterances on similar scales for pitch, loudness, and speed. Significant correlations were found between some acoustic variables and the judgments of some types of emotion. Higher correlations were found between the acoustic variables and judgments of degree of emotion. Correlation coefficients between judgments of emotion and of prosodic features were in general higher than the correlations involving the acoustic variables. Degree of perceived emotion was found to be highly and positively correlated with fundamental frequency range and intensity range. A causal explanation of these relations in terms of human physiology is suggested. (23 ref.)—*Journal abstract.*

4181. Impellizzeri, Irene. (Brooklyn Coll., City U. New York) **Use of the verbal summator technique with language and nonlanguage majors in college.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 143-149.—A set of meaningless vowel patterns presented on the "tautophone" was used to study latent speech with 40 college students. 10 Ss were drawn from each of 4 majors: English, foreign languages, mathematics, and social studies. Foreign language majors, each of them fluent in at least 2 foreign languages, demonstrated greater capacity for storage and retrieval of verbal material than did majors in other disciplines. Their responses also showed greater variety and rhythmic and phonetic congruence with the stimulus.—*Author abstract.*

4182. Ludwig, David & Moore, Michael. (Concordia Senior Coll.) **Language and gender shaping.** *International Journal of Symbolism*, 1969(Aug), Vol. 1(1), 25-27.—In order to determine the extent to which a specific language influences the way a person perceives a certain object or concept, the semantic differential was used to determine whether German-language students perceive the gender of common English words significantly different than do students with little German background. The results showed significant, positive differences in 29 out of 50 words, and this was construed to be an affirmation of the hypothesis.—*Journal abstract.*

4183. Pandey, R. E. (Lincoln U.) **A study of word**

transformation. *Psychological Reports*, 1970(Feb), Vol. 26(1), 295-298.—Investigated word-transformation ability in 37 undergraduates on probation. Tests for 3-, 4-, and 5-letter words which had only 1 possible transformation were constructed. There were 24 items in each category. Results indicate that it is easier to transform 3-letter words than 4-letter words which in turn are easier to transform than 5-letter words. The mean differences and correlations among these categories are significant ($p = .01$). The ability to transform words of various lengths is not several separate abilities, but one.—*Journal abstract*.

4184. Schaeffer, Benson & Wallace, Richard. (U. Oregon) **Semantic interference: Obligatory or optional?** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 335-337.—Demonstrated that semantic similarity interference in different meaning judgments is a function of obligatory memory processes, not of optional ones. 40 undergraduates served as Ss. When the judgment task was embedded in a larger memory task, so that Ss' information-processing capacities were taxed, semantic interference was greater than it was when processing capacities were not taxed. Results argue that interference was obligatory. If interference were optional, taxing Ss' processing capacities should have lessened it, i.e., made the retrieval and use of the interfering information more costly. Because interference increased when capacities were taxed, it is concluded that the interference was a function of obligatory processes over which Ss had no control.—*Journal abstract*.

4185. Schaeffer, Benson & Wallace, Richard. (U. Oregon) **The comparison of word meanings.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 144-152.—Argues that data on 2-word meaning comparisons reflect only the comparison process, not the retrieval from or the organization of semantic memory. A model of comparison is proposed which handles the available data without making assumptions about retrieval or organization. 8 undergraduates served as Ss in 5 experiments. Exp. I supports the model by showing that semantic similarity interferes with the judgment that 2 words have different meanings, and disconfirms A. M. Collins and M. R. Quillian's major alternative model, which assumes that the data on 2-word comparisons reflect retrieval and organization. Exp. II-V demonstrate an important boundary condition for the proposed model: when Ss respond only to the names of words, formal semantic similarity has no effect on the judgment that 2 words have different meanings.—*Journal abstract*.

4186. Taylor, Linda L., Guiora, Alexander Z., Cafford, John C., & Lane, Harlan L. (U. Michigan, Center for Research on Language & Language Behavior) **The role of personality variables in second language behavior.** *Comprehensive Psychiatry*, 1969(Nov), Vol. 10(6), 463-474.—Attempted to construct a unique and direct method of measuring empathy, i.e., the micro-momentary-expression technique, which consists of selecting 30-sec sequences from a 16-mm film of a patient in an interview situation. Results from testing 31 controls and 28 experimental Ss, all undergraduates, indicate that the technique was not successful. However, "important and significant relationships between authenticity of pronunciation of a 2nd language and constellations of factors representing the personality variables of empathy and intuition have been found, confirming the hypothesis under investigation and the underlying psychological

theory. It has been shown that personality characteristics interacting with the interpersonal situation of language learning result in differences in language performance, specifically in the authenticity of pronunciation." The empathy dimension is significantly related to the ability to learn and recall exact details in the pronunciation of a 2nd language, accounting for more than $\frac{1}{2}$ the variance of this skill. Fluency in 2nd-language pronunciation often seems to reflect self-confidence and a degree of narcissism, and the ability to mimic well seems void of empathic understanding.—*D. Prager*.

4187. Yu, Kay C. **Language sounds as cues in judging characteristics of national groups.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 120-131.—Investigated whether language sounds of a given national group could be significant cues for judging characteristics of that group by people from a different culture. Korean and Hindi were employed as stimulus languages on 136 undergraduates, divided randomly into 5 groups. 2 groups of Ss were presented with the sounds of the languages, 2 groups with the sounds and the names of the languages, and 1 with the names of the national groups. Ss were asked to rate the characteristics of the national groups on 20 semantic differential scales. Results showed no significant differences. Korean and Hindi language sounds produced very similar judgments on the characteristics of the speakers. However, different scales were judged significantly in a given direction under different stimulus conditions, and the sounds of the languages resulted in more directional judgments than those of the names of the national groups.—*Journal abstract*.

Psycholinguistics

4188. Drinkwater, Betty A. (U. Queensland, St. Lucia, Australia) **Generalization of responses to verbal stimuli.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 179-183.—Employed a lever-pressing technique with 30 undergraduates to investigate the hypothesis that affective intensity contributes to the strength of the associative connection between words and influences semantic generalization. Motor responses to high affect stimuli and their dominant associates were compared with responses to low affect stimuli and their dominant associates (the associative frequency being matched for both groups). There was significantly more response, and generalization of response, to high affect than to low affect stimuli. In the initial, incidental learning situation, associative frequency was an important factor in generalization, but this effect declined in the retest. It is concluded that affective intensity is a significant variable in both the incidental and the controlled learning of meaningful words, and in semantic generalization.—*Journal abstract*.

4189. Fonagy, Ivan. **Les bases pulsionnelles de la phonation.** [The instinctual bases of phonation.] *Revue Française de Psychanalyse*, 1970(Jan), Vol. 34(1), 101-136.—Metaphors used to qualify sounds common to most languages (e "clear," o "grave," k,t,p "hard," m,l,n, "soft," etc.) cannot always be explained by their acoustic quality, or by tactile and muscular sensations produced by the movements of the tongue. The key to the seemingly unexplainable metaphors in unconscious associations of the phonic act (the act of uttering a sound) to various drives is presented. The proposition is supported by tests with children and adults of different

nationalities, with deaf and blind children, and examples from world literature and actors' use of pronunciation and facial gestures to emphasize different emotions (aggression, tenderness, eroticism).—*A. Doman.*

4190. Hartsough, Ross & Laffal, Julius. (U. Scranton) **Content analysis of scientific writings.** *Journal of General Psychology*, 1970(Oct), Vol. 83(2), 193-206.—Explored whether scientists who have been described as visual imagists (biologists and experimental physicists) will differ from scientists who have been described as verbal imagists (social scientists and theoretical physicists) in the typical content of their writing. Writings of such scientists were analyzed by computer for content, and profiles of content were factor analyzed. Highly represented on Factor I were anthropologists (representing social science) and theoretical physicists. This "verbal" factor contains content suggestive of a humanistic orientation, with many words relating to knowledge and thinking, to groups, to giving and receiving help, and to what is good. Factor II was related to the writings of physicists, both theoretical and applied. Biological writings loaded highest on Factor III. There was no factor that could be identified as a "visual" one. This suggests that the contrast between verbal and visual cognitive orientations may actually be a contrast between those with a central humanistic concern and those who do not have this same central interest. (21 ref.)—*Author abstract.*

AESTHETICS

4192. Bush, Lewis M. (U. Maryland) **The genesis of the American psychological novel.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 352.

4193. Francès, R. **Intérêt et préférence esthétique pour des stimuli de complexité variable.** [A comparative study of interest and esthetic preference for stimuli of variable complexity.] *Journal de Psychologie Normale et Pathologique*, 1970(Apr), Vol. 67(2), 207-224.—Ss were 30 students and 30 workers of the same age. Linear figures were presented by pairs in 2 scales for students and workers, respectively. The variable manipulated was complexity, and the time of exploration was measured. Ss chose the figure of the pair that they preferred and judged most interesting. It was found that students showed a greater tolerance for complexity than workers, and associated less frequently than workers both preference and interest in the same figures. It was also found that complexity has more distinctly differentiating effects for both students and workers than does preference and interest.—*L. A. Ostlund.*

4194. Gregson, R. A. (U. Canterbury, Christchurch, New Zealand.) **An aesthetic hedonic contrast paradox.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 225-232.—Reported a paradox in the relative hedonic evaluation of pictures, and distinguished 2 forms of the paradox: strong and weak. Sequences of gradually changing pictures were valued by 48 high school students on a scale from 1-100 relative to the 1st member of the sequence with a fixed value of 10. Pooled results show the last picture in a sequence was always valued more highly than the 1st, even if the identity of the pictures involved was reversed; individual analyses reveal a less

consistent and more complex pattern of responses. The paradox may be resolved by an explanation in terms of individual Ss shifting their frames of reference with successive stimuli. (20 ref.)—*Journal abstract.*

SMOKING & DRUG & ALCOHOL USE

4199. ———. **Seminar on Drugs for Escape or Religious Experience: Report from Religious Education Association Annual Convention.** *Religious Education*, 1970(Mar), Vol. 65(2), 176-183.—Using a chemical or drug in such a way that it interferes with normal functioning defines drug abuse. 5 classes of psychopharmacological agents having different and varying effects include: sedatives (primarily barbiturates and alcohol); narcotics, such as the opiates; tranquilizers; energizers; and psychedelics. Discussion concerned drug management, hypothesized motivation of drug users, and unique effects of psychedelic drugs (including psychotic experience, extreme mental clarity, esthetic experience, reliving the past, and peak experiences). Aspects of counseling drug users, legal implications of drug use, appropriate drug uses, and recent sources dealing with drug use and abuse received consideration.—*S. E. Gavin.*

4200. Barron, Stanley P., Lowinger, Paul, & Ebner, Eugene. (Community Psychiatric Consultants, Scarborough, Ontario, Canada) **A clinical examination of chronic LSD use in the community.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 69-79.—Of 20 LSD users examined, most chronic users had long-standing personality disorders antedating the use of the drug and apparently not made worse by 2-3 yr. of LSD use. At the same time there was no evidence of significant benefit from the use of the drug. There is a strong tendency to decreasing use among the chronic users. A need and demand for information about LSD is still present despite a virtual ban on such research in the United States since 1966. (18 ref.)—*D. Prager.*

4201. Dolke, A. M. (Textile Industry's Research Assn., Ahmedabad, India) **Extraversion, neuroticism and cigarette smoking in India.** *Journal of the Indian Academy of Applied Psychology*, 1969, Vol. 6(2), 38-42.—Smokers showed significant positive correlations with extraversion (.68 to .71), while negligible correlations were observed with neuroticism scores. The

highest smoking group scored high and the lowest smoking group scored the lowest on extraversion. F ratios on neuroticism, age, as well as income of the 4 groups (3 smokers and 1 nonsmoker) were not significant, indicating that these groups do not differ much in these factors.—U. Pareek.

4202. Harris, Robert T., McIsaac, William M., & Schuster, Charles R. (Eds.) (Texas Research Inst. of Mental Sciences, Houston) **Advances in mental science: II. Drug dependence.** Austin, Tex.: U. Texas Press, 1970. xiv, 342 p. \$10.—Presents 24 papers read at the 2nd annual symposium sponsored by the Texas Research Institute of Mental Sciences. Various authors including physicians, lawyers, research scientists, and social workers deal with physical and psychological dependence resulting from drug abuse, its causes, treatment, and social consequences. Work concerned with treatment of addicts by use of narcotic antagonists and strong analgesics with reduced dependence capacity is also included.

4203. Manheimer, Dean I., Mellinger, Glen D., & Balter, Mitchell B. (Langley Porter Neuropsychiatric Inst., Family Research Center, Berkeley, Calif.) **Marijuana use among urban adults.** *Science*, 1969(Dec), Vol. 166(3912), 1544-1545.—Interviewed 1104 men and women, 18 yr. of age or older, to determine the generality of marihuana use in a large metropolitan city among older persons and young adults. Results indicate that a relatively high proportion of young adults (as many nonstudents as students) have used marihuana 1 or more times. Almost no adults over 30 reported using LSD, and only 9% of men and 1% of women over 35 reported having used marihuana.—*Journal abstract.*

4204. McFall, Richard M. (U. Wisconsin) **Effects of self-monitoring on normal smoking behavior.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 135-142.—16 Os unobtrusively monitored 16 undergraduates' smoking frequency and duration throughout base-rate, experimental, and return-to-base periods. In the experimental period, Ss self-monitored either their frequency of smoking or not smoking. Smoking frequency and duration were significantly affected by such self monitoring, indicating that self-monitoring is a reactive data-gathering procedure. (15 ref.)—*Journal abstract.*

4205. Mitchell, Kenneth R., Kirkby, Robert J., & Mitchell, Daphne M. (U. New South Wales, Sydney, Australia) **Drug use by university freshmen.** *Journal of College Student Personnel*, 1970(Sep), Vol. 11(5), 332-336.—Investigated the incidence of drug use and age of initial drug contact, source and reason for taking drugs, and the relationship between drug use and perceived harmony of the parents' marital relationship for 71 off-campus freshmen at the University of Sydney. As expected, the use of tobacco and alcohol was considerably higher, while the age of initial contact was much younger, than for all other drugs. Large differences were found with results of reports of related research. Curiosity, academically related stress, and conformity were the major motivating factors cited by the drug users sampled.—R. H. Mueller.

4206. Orne, Martin T. (Pennsylvania Hosp., Philadelphia) **From the subject's point of view, when is behavior private and when is it public: Problems of inference.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 143-147.—Raises methodological questions concerning R. M. McFall's (see PA, Vol.

45:Issue 3) study of the effect of self-monitoring on smoking behavior. It is emphasized that results of such studies should be evaluated from the viewpoint of the S rather than the investigator. Some measures assumed to be unobtrusive by the investigator share qualities of deception experiments, and, therefore, it must be determined whether it is the S or the E who is deceived. Procedures that may be helpful in clarifying such questions and the difficulties of generalizing results to other contexts are discussed.—*Journal abstract.*

4207. Smith, Roger C. (U. California, Berkeley) **The marketplace of speed: Compulsive methamphetamine abuse and violence.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 492-493.

4208. Swisher, John D. & Horman, Richard E. (Pennsylvania State U.) **Drug abuse prevention.** *Journal of College Student Personnel*, 1970(Sep), Vol. 11(5), 337-341.—Discusses the effect of a federally granted program entitled "A Retreat on the Hazards of Drug Abuse" in which undergraduate and graduate students as well as administrative staff members were invited to attend. Results indicate that the program was particularly effective in increasing the participant's level of information regarding drugs, had a favorable impact on the attitudes of undergraduate students particularly with regard to marihuana, and stimulated the participants to further acquire and disseminate information related to drug education.—R. H. Mueller.

4209. Taylor, Robert L., Maurer, John I., & Tinklenberg, Jared R. (5454 Wisconsin Ave., Chevy Chase, Md.) **Management of "bad trips" in an evolving drug scene.** *JAMA: Journal of the American Medical Association*, 1970(Jul), Vol. 213(3), 422-425.—Discusses the problems created by the rising incidence of psychedelic drug usage and the evolution of new drugs. Diagnostic complications from indiscriminate ingestion, contamination, and adulteration are considered, along with serious treatment problems which may arise. Suggestions are made for treating the "bad tripper," emphasizing that "protection of the individual from dangerous behavior either to himself or others should be a fundamental concern in treating the bad trip." In managing bad trips, the establishment of verbal contact with minimal use of tranquilizers is suggested. Types and doses of medication to help cases where severe ego disruption has occurred are discussed. Suggestions are made for physician counseling and physical and mental examinations, including follow-up treatment.—P. Hertzberg.

4210. Vaillant, George E., Brighton, Jane R., & McArthur, Charles. (Tufts U., Medical School) **Physicians' use of mood-altering drugs: A 20-year follow-up report.** *New England Journal of Medicine*, 1970(Feb), Vol. 282(7), 365-372.—A prospective study carried out over a 20-yr period showed that a group of 45 physicians took more tranquilizers, sedatives, and stimulants than 90 matched controls. As college sophomores both groups had been selected for the study because of better than average physical and psychological health. The physicians drank alcoholic beverages and smoked cigarettes to the same extent as the controls. Possible steps to mitigate the occupational hazards of drug use in physicians are suggested.—*Journal abstract.*

4211. Weech, Alexander A. & Bibb, Richard E. (U. Cincinnati, Medical School) **Toward a rational approach to psychedelics: The controversy over popular use from a clinical viewpoint.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 57-68.—The propo-

nents of psychedelic drugs are often among those youth involved in active social protest while the antagonists are largely from the alarmed segments of older generations. "The major purpose of this essay is to review the effects of LSD and other psychedelics on human behavior, including some of the medical complications of their use and some sociologic and psychologic aspects of their abuse." Legal aspects of the drug situation are briefly discussed. The use of a psychedelic may represent a serious need for professional guidance. Current obstacles to obtaining such help are briefly reviewed. (32 ref.)—D. Prager.

PERSONALITY

4212. Amat, Enrique. (Valencia Medical School, Spain) **Tendencias actuales en los estudios caracterológicos en psiquiatría.** [Current tendencies in the study of personality in psychiatry.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Jan), Vol. 28(1), 1-9.—Reports that from 1963-1966 54 works were published which treated the problem of character in relation to psychiatry—a rate of 39 for every 100 psychiatric publications. The ambiguity of the actual meaning of character is discussed, and the possibilities of somatic, atomistic, and individualistic applications as well as psychological, genetic, and sociogenic applications are noted. Although it was agreed that character can not be statistically evaluated, characterological implications were derived from 175 articles which were grouped into psychiatric categories: adolescent psychology, behavior disorders, depression, neuroses, schizophrenia, and psychopathology. It is concluded that character is a dynamic entity, comprising the non-physical, individual part of man which escapes empirical definition. (89 ref.)—P. Hertzberg.

4213. Buhler, Charlotte & Massarik, Fred. (Eds.) (U. Southern California) **The course of human life: A study of goals in the humanistic perspective.** New York, N.Y.: Springer, 1968. ix, 422 p. \$10.

4214. Cassel, Russell N. (U. Wisconsin, Milwaukee) **Critical stages in man's ego-ideal or conscience development.** *Psychology*, 1970(Aug), Vol. 7(3), 15-25.—Describes a series of sequential stages for the development of man's ego-ideal or conscience. The ego-ideal is defined as the rewarding aspect of man's psychic structure; while the conscience is the punishing aspect. Stages described are: embryo, birth trauma, genetic epistemology, imprinting, sex typing, trust and hope, basic personality formation, moral realism, self-identification, existential fidelity, intimacy, generativity, functional autonomy, integrity, and self-actualization. The ego-ideal and conscience are described as the means for determining the behavior of man, and for relating man to the society of which he is a part. The logic contained in the described stages forms the basis for an "ego-psychology" approach to the problem of delinquency prevention and correction. Emphasis in the approach is placed on congruence between the individual and society, in terms of the resolution of social day-to-day problems, and in relation to what constitutes an ideal response for such problems. The procedure entails computer assist counseling (COASCON). (17 ref.)—J. A. Blazer.

4215. Leongard, K. **Akzentuierte Persönlichkeiten.** [Accented personalities.] Berlin, W. Germany: VEB

Volk und Gesundheit, 1968. 287 p.—Presents an exposition and generalization on the problems of characterology and the "systematics of characterological anomalies," where the "individual traits [Wesenszüge]" still do not constitute a pathological deviation from the "average" structure of the human personality.—I. D. London.

4216. Sagarra Solé, J. (Hosp. Clínico Barcelona, Spain) **Los estudios caracterológicos en España.** [Character studies in Spain.] *Revista de Psicología Normal e Patológica*, 1968(Jan), Vol. 14(1-2), 67-73.

Brussels, Lab. of Industrial Psychology, Belgium) **Approche de la dynamique comportementale du représentant de commerce et étude de l'empathie comme variable de personnalité dans une batterie de tests.** [Approach to the behavior dynamics of salesmen and investigation of empathy as a personality variable in a battery of tests.] *Bulletin Centre d'Etudes et Recherches Psychotechniques*, 1969(Jan), Vol. 18(1), 65-78.—Reviews various tests which can be of use in measuring empathy, and discusses the value of empathy in salesmanship. (62 ref.)

4218. Wrenn, Robert L. & Ruiz, Rene A. (Eds.) (U. Arizona) **The normal personality: Issues to insights.** Belmont, Calif.: Brooks/Cole, 1970. ix, 361 p.—Contains selected readings by various authors intended to help the teacher of normal and abnormal personality courses to slant his class toward a more personal involvement in the issues of everyday living. Topical areas were derived from questions raised during class discussions. Chapter format typically includes an introduction, a reading, and problem situations.

PERSONALITY TRAITS & PROCESSES

4219. Bronfenbrenner, Urie. (Cornell U., New York State Coll. of Human Ecology) **Some reflections on "Antecedents of optimal psychological adjustment."** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 296-297.—E. Siegelman, J. Block, J. Block, and A. von der Lippe (see PA, Vol. 45:Issue 3) are complimented for exploiting an important research opportunity, but also criticized for employing a relatively inefficient design, equating clinical judgments with objective reality, and failing to examine possible components in the global index of optimal adjustment. It is noted that most of the shortcomings can be rectified in subsequent analyses.—*Journal abstract.*

4220. Dreiling, Douglas H. (Texas Technological U.) **The effects of dogmatic and non-dogmatic feedback upon self-ideal discrepancies of repressors and sensitizers.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 391-392.

4221. Felipe, Abraham I. (U. Philippines, Quezon City) **Evaluative versus descriptive consistency in trait inferences.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 627-638.—Critically compared predictions of evaluative and descriptive consistency theories in tasks involving trait inferences. Trait terms that avoid the usual confounding of evaluative and descriptive aspects were used in inferences between terms that had high or low descriptive overlaps. Inferences were done onto 3 types of bipolar scales which differed according to which aspect (descriptive or evaluative) of their defining terms was varied. Results indicate 2 consistency-achieving mech-

anisms, appearing in a definite order of priority: descriptive consistency is 1st attempted, then evaluative consistency. A model to reconcile evaluative and descriptive consistency theories on the dynamics of trait inferences is proposed, and its implication to cognitive dynamics is discussed.—*Journal abstract.*

4222. Hofstee, Willem K. (U. Groningen, Netherlands) **Comparative vs. absolute judgments of trait desirability.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 639-646.—Each of 16 lists containing 25 pairs of equally desirable and 26 pairs of equally undesirable traits were administered to 1000 males being screened for military fitness in Holland. $\frac{1}{2}$ of the lists were formed by reversing members of a pair and reversing the order of pairs. The obtained comparative data were contrasted with data from a study of absolute judgments. Of the 408 pairs of traits, 246 had 1 member judged significantly higher than the other. For desirable traits, the 1st term was chosen most frequently; for undesirable, the 2nd term was rejected most frequently. Terms suggesting conservatism were judged more desirable in the comparative method; terms suggesting dynamic behavior were from the absolute judgment method.—*N. M. Chansky.*

4223. King, Mark; Walder, Leopold O., & Pavey, Stanley. (Iowa State U.) **Personality change as a function of volunteer experience in a psychiatric hospital.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 423-425.—Tested 416 college students for degree of moral tolerance and self-acceptance before and after completing undergraduate psychology courses. 16 of the students concurrently did volunteer work in mental hospitals. The within-Ss analysis indicates the volunteer experience did not significantly change the moral tolerance scores, whereas it did result in greater self-acceptance scores.—*Journal abstract.*

4224. Lawrence, Philip S. (Arizona State U.) **The assessment and modification of assertive behavior.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 396-397.

4225. MacNeil, Lawrence W. & Rule, Brendan G. (U. Alberta, Edmonton, Canada) **Effects of conceptual structure on information preference under sensory deprivation conditions.** *Journal of Personality & Social Psychology*, 1970(Nov), Vol. 16(3), 530-535.—Investigated whether persons varying in conceptual structure differed in their preferences for simple or complex messages under sensory-deprivation conditions. $\frac{1}{2}$ of 20 undergraduates classified as concrete and $\frac{1}{2}$ of 20 Ss classified as abstracts were randomly assigned for 4 hr. to either a sensory-deprivation or a nondeprivation condition. By pressing an appropriate button, an S chose to hear either a simple or a complex message. Among several significant effects, the major prediction was supported by the data. During sensory deprivation, the concrete Ss requested the simple message more than the complex message, whereas the abstract Ss requested the complex message more than the simple message. Abstract and concrete Ss did not differ in their requests for a specific type of message under nondeprivation conditions. Data are discussed in terms of the H. Schroder, M. Driver, and S. Streufert contention that the information orientation of persons varying in conceptual structure differs, and in terms of implications for attitude change studies. (24 ref.)—*Journal abstract.*

4226. Meyer, Wulf U. (U. Ruhr, Psychologische Inst.,

Bochum, W. Germany) **Bemerkungen zur inhaltsanalytischen Erfassung der Leistungsmotivation: Kritische Anmerkungen zu einer Arbeit von Sader und Keil.** [Observations concerning content analytic measures of achievement motivation: Critical remarks concerning a work by Sader and Keil.] *Archiv für die gesamte Psychologie*, 1969(Aug), Vol. 121(1), 55-67.—Criticizes an investigation by M. Sader and W. Keil (see PA, Vol. 45:Issue 3) with particular emphasis on their treatment of conflict analysis in TAT and their critique of the content analytic measure of achievement motivation developed by H. Heckhausen. (French summary) (33 ref.)—*English summary.*

4227. Miller, Alan R., Woo-Sam, James; Zavos, Harry, & Barker, Barbra. **An objective measure of induced aggression.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 11-14.—Describes a method of objectively measuring induced aggression in 67 undergraduates. Those in the verbally threatened group expressed aggression by sabotaging E's research project. The extent of aggression was measured by the number of Ss making errors and the total numbers of errors made by Ss as compared to controls. More Ss than controls made errors. (23 ref.)—*Journal abstract.*

4228. Ozehosky, John R., McCarthy, James B., & Clark, Edward T. (St. John's U., New York, N.Y.) **Manifest needs among ROTC and non-ROTC undergraduates.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 299-301.—Studied manifest needs of ROTC and non-ROTC undergraduates utilizing the EPPS. It was hypothesized that the ROTC Ss would be higher than non-ROTC Ss on order and lower on autonomy and aggression. The EPPS was administered to 20 ROTC undergraduates and to a randomly selected sample of 20 male undergraduates. None of the hypothesized differences in manifest needs were found, but the ROTC Ss were significantly lower on intraception and significantly higher on heterosexuality than the non-ROTC Ss.—*Journal abstract.*

4229. Sader, Manfred & Keil, Wolfgang. (U. Mainz, Psychologische Inst., W. Germany) **Faktorenanalytische Untersuchungen zur Projektion der Leistungsmotivation.** [Factor analytic investigations concerning the projection of achievement motivation.] *Archiv für die gesamte Psychologie*, 1968(Aug), Vol. 120(1), 25-53.—Investigated factor analytic relationships among data of achievement motivation by H. Heckhausen, a psychometric consolidated method developed in Mainz, and certain reference variables (Cattell and Guilford's questionnaire on estimation of values, and Amthauer's Intelligence Structure Test, a questionnaire on achievement motivation) with 321 Ss. Factor analyses of the fantasy production in response to TAT plates evoking success or failure demonstrated 2 independent dimensions: fear of failure and hope of success. These independent factors of the specific picture production can be explained by overlapping of the inhibitory gradient over the expressive gradient (analogous to the conflict model of N. E. Miller). Similar factors as used in the method of Heckhausen can be proven in the cognitive orientated objective key procedure measuring the achievement motivation. Here Ss relate to each TAT picture, 8 neutral and 12 achievement orientated responses, as correct or not. Analogous results are reproduced when the series of pictures are changed. (French summary) (56 ref.)—*English summary.*

4230. Shortell, Jae J., Epstein, Seymour, & Taylor,

Stuart P. (Mid-Fairfield Child Guidance Center, Norwalk, Conn.) **Instigation to aggression as a function of degree of defeat and the capacity for massive retaliation.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 313-328.—48 Ss, $\frac{1}{2}$ of whom were assigned to a condition of massive retaliation (MR) and $\frac{1}{2}$ of whom were not (NMR), competed against a presumed opponent. The loser on each trial received a shock of intensity level selected by the winner at the beginning of a trial and, simultaneously, feedback on the opponent's shock setting. The winner received only feedback on the opponent's shock setting. Defeat and feedback of aggressive intent (opponent's shock setting) were varied independently. In the MR condition, an extreme level of shock could be selected. Although its use was avoided, its psychological presence influenced perception of the opponent, aggressive behavior, and physiological arousal. Consistent with previous findings, primary frustration was found to be a relatively inconsequential instigator to aggression compared to learned social attitudes.—*Journal summary.*

4231. Shrauger, J. Sidney & Rosenberg, Saul E. (State U. New York, Buffalo) **Self-esteem and the effects of success and failure feedback on performance.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 404-417.—High and low self-esteem Ss received success or failure feedback regarding their performance on a task described as measuring their sensitivity to other people. Presumably as part of another study, changes in their self-perceptions regarding sensitivity to others were assessed, as well as changes in their performance on a different task. Changes in self-perception were greater when the feedback was consistent with Ss' overall level of self-evaluation. Task performance following failure was poorer than that following success. High self-esteem Ss performed better following success feedback, and low self-esteem Ss performed more poorly following failure. There were no significant performance changes for the high self-esteem failure and low self-esteem success Ss. The degree of change in self-perception of sensitivity to others was highly correlated with the magnitude of performance changes.—*Journal summary.*

4232. Siegelman, Ellen; Block, Jack; Block, Jeanne, & von der Lippe, Anna. (U. California, Berkeley) **Antecedents of optimal psychological adjustment.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 283-289.—Attempts to develop some understanding of the antecedents of psychological health from a major set of longitudinal studies. 171 adult Ss were described by means of the California Q set. These empirical descriptions were compared with an independent hypothetical Q description of the optimally adjusted personality. A number of measures were analyzed to identify the antecedent circumstances that differentiated the 48 high optimal adjustment from the 50 low optimal adjustment adults of both sexes. Although obtained by different techniques and at widely different times, the findings univocally indicate healthy, democratic, value-oriented homes among high optimal adjustment Ss. Good adult adjustment was associated with a cognitively competent and integrated mother. Poor adult adjustment was associated with a neurotic, anxious mother for both boys and girls, and additionally with a neurotic father for girls.—*Journal abstract.*

4233. Strickland, Bonnie R. (Emory U.) **Individual differences in verbal conditioning, extinction, and awareness.** *Journal of Personality*, 1970(Sep), Vol. 38(3),

364-378.—Examined the relationship of need for approval, a belief in internal vs. external control of reinforcement, and verbal intelligence to acquisition, extinction, and awareness in a verbal conditioning task. Based on a postexperiment interview and recognition task, Ss were grouped according to their awareness of the response-reinforcement contingencies and the degree to which they admitted influence by the E. Approval-motivated Ss were more likely to acquire the reinforced response regardless of awareness levels than were low need for approval Ss. Ss assessed as internal were more likely to deny influence by the E and in some instances were more resistant to extinction than Ss called external. Ss higher in verbal intelligence evidenced more awareness than Ss with lower intelligence scores. (28 ref.)—*Journal summary.*

4234. Tiffany, Donald W., Salkin, Gail G., & Cowan, James R. (Inst. for Community Studies, Kansas City, Mo.) **Generalized expectancies for control of reinforcements compared to experienced control.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 519-520.—Rotter's Internal-External (I-E) Control Scale and the Experienced Control (EC) Scale were administered to 74 unemployed males. The I-E scores were correlated with the EC constructs. 5 of 90 correlations were significant at the .01 or .05 level. It is concluded that there was an absence of agreement between expectancies for control of reinforcements and experienced control as measured by the I-E and EC scales.—*E. J. Kronenberger.*

Behavior Correlates

4235. Connor, George N. & Boblitt, W. Edgar. (U. South Carolina) **Reported frequency of dream recall as a function of intelligence and various personality test factors.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 438-439.—Pearson product-moment correlations were computed between scaled responses to a dream recall questionnaire and various instruments. Ss were 149 undergraduates and 1st-yr graduate students from 2 universities. Shipley Institute of Living (IQ measure) scores, and Institute for Personality and Ability Testing anxiety and intelligence (Scale B) scores were positively correlated to dream recall. Ego strength scores were negatively correlated to dream recall. Earlier similar findings were supported.—*E. J. Kronenberger.*

4236. Dies, Robert R. (U. Maryland) **Need for social approval and blame assignment.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 311-316.—Investigated the relation of the need for social approval (as measured by the Marlowe-Crowne Social Desirability Scale) to the attribution of blame. 40 dyads of female psychiatric nursing students worked on a cooperative task. Both dyad members were exposed to an induced failure experience and made subsequent ratings whereby blame could be ascribed to features of the experiment, transient personal states, and/or to one's partner. As predicted, approval-dependent persons were more likely to rationalize or excuse the "failure" by blaming various experimental factors and/or their partners, but this was always done within the limits of a generalized tendency to seek social acceptance by expressing attitudes complimentary to other persons or situations.—*Journal abstract.*

4237. Farley, Frank H. & Farley, Sonja V. (U. Wisconsin) **Impulsiveness, sociability, and the preference for varied experience.** *Perceptual & Motor*

Skills, 1970(Aug), Vol. 31(1), 47-50.—Employed 290 British and American Ss to study the possibility that F. H. Farley and S. V. Farley's (see PA, Vol. 41:7335) previous report of a significant relationship of extroversion-introversion to stimulus-seeking motivation was attributable primarily to the impulsivity component of extroversion-introversion, with the sociability component contributing insignificantly to that relationship. Results significantly replicated the extraversion and stimulation-seeking relationship. In addition, impulsivity was generally found to be of slightly greater magnitude in its relation to stimulation-seeking than was sociability.—*Journal abstract*.

4238. Haynes, Jack R. & Carley, John W. (North Texas State U.) **Relation of spatial abilities and selected personality traits**. *Psychological Reports*, 1970(Feb), Vol. 26(1), 214.—Based on descriptions of field-independence and field-dependence, an attempt was made to determine if similar characteristics could be found using different spatial personality measures. The 16 PF, the Guilford-Zimmerman Spatial Orientation Test and Spatial Visualization Test were administered to 106 undergraduates. Results indicate that these spatial ability tests measure the characteristics of field-independence.—*Author abstract*.

4239. Hogan, Robert. (Johns Hopkins U.) **A dimension of moral judgment**. *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 205-212.—Moral principles which are used to guide reasoning in situations of normlessness or moral uncertainty can be placed in categories corresponding to 2 classic traditions in social philosophy: "the ethics of personal conscience" and "the ethics of social responsibility." Through the use of a self-report measure, evidence was provided for the hypothesis that the tendency to adopt 1 or the other of these viewpoints is a result of the adherent's underlying personality structure. Proponents of the ethics of personal conscience, for example, tended to be progressive, rebellious, and unconventional, with pronounced tendencies toward social activism. Persons characterized by the ethics of social responsibility were good-natured, thoughtful, and well-socialized, but somewhat conservative in their political orientation. (29 ref.)—*Journal abstract*.

4240. Kurtz, Helen. (Yeshiva U.) **Investigation of the relationship between attitudes and problem solving**. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 466-467.

4241. Morgan, Arlene H., Lezard, Fay; Prytulak, Susan, & Hilgard, Ernest R. (Stanford U.) **Augmenters, reducers, and their reaction to cold pressor pain in waking and suggested hypnotic analgesia**. *Journal of Personality & Social Psychology*, 1970(Sep), Vol. 16(1), 5-11.—Individual differences in the kinesthetic after-effect, as studied through the size comparisons of wooden blocks by thumb and forefinger following contrast stimulation according to the method of A. Petrie, led to the selection of 6 augmenters and 6 reducers from a total sample of 22 male and 20 female undergraduates. Augmenters and reducers did not differ in responsiveness to the pain of immersing a hand and forearm in circulating ice water, or in hypnotic susceptibility. However, augmenters reduced their pain significantly more under suggested hypnotic analgesia than reducers, a result consistent with some earlier findings with pain reduction through aspirin and with audioanalgesia. Personality measures yielded little except

a tendency for augmenters to be more tolerant of ambiguity than reducers. Because reliability measures over 2 days show a reversal of sign—those augmenting more on 1 day reducing more on the next, and vice versa—the problem of what is being measured as a personality variable in the block experiments requires further examination.—*Journal abstract*.

4242. Serun, Camella S. & Myers, David G. (U. Alabama) **Note on prejudice and personality**. *Psychological Reports*, 1970(Feb), Vol. 26(1), 65-66.—Examined the relationship between prejudice and personality in a sample of 101 high school Ss. Contrary to prediction, no significant correlation of prejudice with repression (.18) or anxiety (.05) scores was observed.—*Journal abstract*.

4243. Shybut, John. (Northern Illinois U.) **Internal vs. external control, time perspective and delay of gratification of high and low ego strength groups**. *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 430-431.—Compared high (N = 45 undergraduates) and low (N = 45 undergraduates) ego strength groups on the 3 measures. High ego strength Ss showed a more extended post- and future time perspective, assigned higher values to hypothetical choices, and were willing to wait longer for the delayed reward than low ego strength Ss.—E. J. Kronenberger.

4244. Sweeney, Donald R. & Fine, Bernard J. (U.S. Army Research Inst. of Environmental Medicine, Natick, Mass.) **Note on pain reactivity and family size**. *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 25-26.—Divided 33 soldiers into high, medium, and low pain-reactivity subgroups, based on their subjective responses to immersion of their hands in cold (4°C) water. Subgroups were compared for differences in family size and birth order. Results show that Ss from smaller families (1-3 children) exhibit significantly higher pain reactivity than Ss from larger families (4 or more children).—*Journal abstract*.

4245. Verinis, J. Scott. (Mt. Sinai Hosp., Chicago, Ill.) **Inhibition of humor enjoyment: Effects of sexual content and introversion-extraversion**. *Psychological Reports*, 1970(Feb), Vol. 26(1), 167-170.—Examines the inhibition of enjoyment of humor. Exp. I employed sexual cartoons. Expectations were that 17 female high school graduates asked to analyze these cartoons for their point would show less enjoyment than 17 Ss not asked to do this. These expectations were not supported. Exp. II explored the effects of the introversion-extraversion variable on inhibition of enjoyment of humor. The expectations that those Ss high in introversion would show the greatest inhibition were verified.—*Journal abstract*.

4246. Ward, William D. & Day, Charles R. (State University Coll. New York, Brockport) **Manifest anxiety as related to perceived similarity to peers**. *Psychological Reports*, 1970(Feb), Vol. 26(1), 247-250.—Tested the hypotheses that peer identification would be negatively associated with adjustment and would be more important to the adjustment of the females than to the adjustment of the males with 80 undergraduates. Perceived similarity to a peer (PSP) was measured with the Role Construct Repertory Test, and the MA scale was the adjustment index. A 2 × 2 factorial design, sex by PSP, with MA scale scores as the dependent variable, was used. High PSP Ss differed significantly from low PSP Ss ($p < .001$), and the main effect for sex and the sex by PSP interaction were not significant. Cell

comparisons, however, suggest that males were more responsible for the main effect than females were. The 1st hypothesis was clearly supported, and the trend opposite to the 2nd hypothesis was noted.—*Journal abstract.*

INTELLIGENCE

4247. Bunuan, Josefina S. (Boston U., School of Education) **Translation and adaptation of the Stanford-Binet Intelligence Scale, Form L-M, for Filipino children.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 377.

4248. Chawla, T. R. **An evaluative study of new culture-free intelligence test (KIT:EXP).** *Journal of Psychological Researches*, 1969, Vol. 13(2), 74-76.—Reliability coefficients of .79 and .83 were observed for the Kalon Intelligence Test (KIT) using IQ and MA scores. The correlation coefficient of .71 between KIT and WISC points to the high validity of the KIT.—*U. Pareek.*

4249. Eckman, Guy; Rice, Mary, & Smith, Kendon. (U. North Carolina, Greensboro) **A Hullian constant as an index of intelligence: Two empirical investigations.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(1), 47-53.—Following C. L. Hull, it is widely considered that the asymptote of the learning curve represents motivational factors, but that rate of approach to asymptote (i) represents associational factors. The suggestion that i may be a measure of intelligence was tested empirically in 2 studies with 32 8th graders and 30 10-yr-old children, respectively. An initial exploratory study yielded a positive correlation between i and IQ. A more rigorous replication did not.—*Journal abstract.*

4250. Gaudet, Irby J. & Moon, W. Harold. (Auburn U.) **Effects of differential feedback on opinions of and responses to intelligence tests.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 376-380.—On 2 separate occasions, 160 college Ss were administered both an IQ test and a test opinion scale in counterbalanced orders. Ss received differential feedback—information presumably drawn from their earlier IQ test's performance—before the 2nd administration. Feedback significantly affected subsequent retest IQ test score and opinion scale scores. Order of testing was a significant variable in the test-feedback-retest condition. It is concluded that when the testing situation is viewed as a complex interaction of stimuli, S, and situational variables, the variables investigated can systematically and significantly affect the performance of the examinee.—*Journal abstract.*

4251. Giltay, H. **De eerste kinderherinneringen van drie geniale mensen.** [The earliest recollections of three men of genius.] *Gawein*, 1969(Mar), Vol. 17(2-3), 143-149.—Explores the hypothesis that early recollections indicate the direction which men of genius will follow. Recollections of Albert Einstein, Jakob von Uexküll, and Martin Buber are examined.—*English abstract.*

4252. Golland, Jeffrey H., Herrell, James M., & Hahn, Michael. (New York U., Bellevue Medical Center) **Should WAIS subjects explain picture arrangement stories?** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 157-158.—To determine whether requiring 16-65 yr. old WAIS Ss to explain their Picture Arrangement (PA) sequences affects PA scores, 56 Ss were given the WAIS and asked to tell PA stories, and 102 Ss were given the WAIS under standard instructions.

37 pairs of Ss were matched for age, Full Scale IQ, and reason for referral. No significant differences were found between Ss who told PA stories and those who did not. Findings were contrasted with those of J. Herrell and J. Golland, who found a 2-point scaled score increment on PA for WISC Ss who explained their sequences.—*Journal abstract.*

4253. Jacobs, Paul I. & Vandeventer, Mary. (Yeshiva U., Ferkau Graduate School) **Information in wrong responses.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 311-315.—Under some circumstances the wrong responses S makes on a test may contain important information. The notion of facet design provided a systematic method for a priori ordering of the distractors on the Coloured Progressive Matrices test (administered to 362 Ss) as to degree of correctness. A score based on type of distractor chosen was shown to have a moderate degree of test-retest reliability, concurrent and predictive validity, and cross-cultural applicability. Results suggest a reexamination of I. E. Sigel's (see PA, Vol. 39:1791) finding that type of error and total score were unrelated.—*Journal abstract.*

4254. Joesting, Joan & Joesting, Robert. (U. Georgia) **Future problems of gifted girls.** *Gifted Child Quarterly*, 1970(Sum), Vol. 14(2), 82-90.—A review of pertinent literature demonstrates the fact that large numbers of gifted girls limit their educational and professional development. The position is taken that talented girls who do not fulfill their potential are likely to develop emotional problems. Various alternatives are presented for the gifted girl and the society.—*S. Krippner.*

4256. Michel, Lothar. (U. Mannheim, Psychologische Inst., W. Germany) **Empirische Untersuchungen zur Frage der Übereinstimmung und Gültigkeit von Beurteilungen des intellektuellen Niveaus aus der Handschrift.** [Empirical investigations concerning the question of consistency and validity of assessing intellectual levels from handwriting.] *Archiv für die gesamte Psychologie*, 1969(Aug), Vol. 121(1), 31-54.—Reviews empirical investigations regarding the interpreter consistency and validity of assessing intelligence from handwriting and presents new experiments. It was found, that single graphic signs as well as psychodiagnostic statements about intelligence made by nonexperts and by graphologists show very low validity. Now graphologists are obviously primarily concerned with educational attainment. This very aspect of intelligence, however, is traced more economically and with higher validity by other techniques, since evaluation of intelligence on the basis of graphology seems to be of little usefulness. (39 ref.)—*English summary.*

4257. Sattler, Jerome M. & Winget, Barbara M. (San Diego State Coll.) **Intelligence testing procedures as affected by expectancy and IQ.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 446-448.—2 experiments (N = 8 graduate students in each study) were performed to evaluate the effects of referral reports and examinee intellectual levels on testing procedures. Examinees with superior intelligence obtained significantly more credit than examinees with average intelligence for the same ambiguous responses on the Comprehension, Similarities, and Vocabulary subtests of the WAIS. The intellectual level did affect some test observations but referral reports did not significantly

affect test scoring although occasionally affecting the examiners' test observations. "The results indicate that examiners must carefully guard against the halo effect."
—E. J. Kronenberger.

4258. Spreen, Otfried & Tryk, H. Edward. (U. Victoria, British Columbia, Canada) **WISC Information subtest in a Canadian population.** *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 294-298.
—Substituted 2 Canadian items in the Information subtest of the WISC. Data from test administration to 300 7-14 yr. old Canadian children were analyzed. Item analysis indicates that 1 substitution is reasonable but not the other. The Information subtest mean increased consistently with age but was consistently lower than the means of the other subtests. (French summary)—*Journal abstract*.

4259. Walker, Ronald E., Sannito, Thomas C., & Firetto, Anthony C. **The effect of subjectively reported anxiety on intelligence test performance.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 241-243.—Examined the effect of experimentally induced anxiety on the performance of the 1st 5 verbal subtests of the WAIS given to 79 undergraduate students. A response to the questions "How did you feel while you were being tested?" was used as an indicator of anxiety. None of the mean differences between groups (control-experimental; male-female) was significant.—H. Kaczowski.

CREATIVITY

4260. Appleton, Robert F. (Columbia U.) **The telearchic search in the creative process.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 376.

4261. Eisenman, Russell. (Temple U.) **Creativity change in student nurses: A cross-sectional and longitudinal study.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 320-325.—Studied 266 student nurses from 2 schools cross-sectionally (freshmen, juniors, and seniors), while 30 Ss from each school, were studied longitudinally (freshman and senior yr.). 2 creativity measures were employed: originality, as measured by an unusual uses test in which Ss gave uses for a brick, and a true-false, paper-and-pencil measure, the Personal Opinion Survey. Results indicate significant decline in originality with increased class standing. The longitudinal data also supported this finding. (27 ref.)—*Journal abstract*.

4262. Elsom, Billy F. (North Texas State U.) **Creative ability and perceived parent-child relations.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 59.

4263. Green, Elmer E., Green, Alyce M., & Walters, E. Dale. (Menninger Foundation, Topeka, Kan.) **Voluntary control of internal states: Psychological and physiological.** *Journal of Transpersonal Psychology*, 1970, Vol. 9(1), 1-26.—Attempts to indicate that "psychophysiological training for creativity is a reasonable hypothesis." Earlier work on electrophysiological instrumentation and methodology which resulted in the audiogenic feedback training method is summarized. Results with this method for about 60 Ss showed such physiological changes as (a) relaxation of muscle tension to low levels, (b) control of temperature of the hand, and (c) increase in alpha rhythm with eyes open and while talking to the E. Psychological changes included (a) body-image changes, (b) feelings of tranquility, and (c) hypnagogic and dream-like images. Reverie accompa-

nying production of theta waves and low-frequency alpha seems, under certain conditions, to make possible "hypnagogic-like imagery, the sine qua non of creativity for many outstanding people." Other methods for producing hypnagogic-like imagery are discussed. It is concluded that such methods hold much promise for transpersonal psychology by providing training in internal awareness and control. (52 ref.)—P. E. Lichtenstein.

4264. Hahn, Marshall. (U. Minnesota) **Review of research on creativity.** Minneapolis, Minn.: Minnesota Research Coordination Unit in Occupational Education, U. Minnesota, 1968. 25 p.

4265. Kuusinen, Sharon. (U. Michigan) **Evidence for a curvilinear relationship between complexity and originality.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 329-343.—Tested the hypothesis of a curvilinear relationship between preference for complexity and each of 2 components of creativity—originality and fluency—for 4 complexity levels within the upper half of the complexity distribution. The hypothesis was based on an interpretation of extremely high complexity levels as emphasizing rejection of conventionality more than fondness for novelty and tolerance of ambiguity. The results not only supported the main hypothesis of a curvilinear relationship but also suggested that originality and fluency declined beyond the 2nd level of complexity studied. Question is cast on the assumption that increasing complexity is necessarily productive of increasing creativity. Results were interpreted as also being consistent with Berlyne's hypothesis that moderate increases in arousal are most conducive to learning.—*Journal summary*.

4266. Lehrer, Arnold C. (Colorado State Coll.) **The personality correlates of creativity in undergraduates.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 397.

4267. Ohnmacht, Fred W. (State U. New York, Albany) **Personality and cognitive referents of creativity: A second look.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 336-338.—Administered 5 measures of divergent production and the Myers-Briggs Type Indicator to 90 undergraduates. As very few of the correlations were significant, it may be concluded that there is no correspondence across the cognitive and personality referents of creativity examined here.—*Journal abstract*.

4268. Taylor, Irving A. (Smith Richardson Foundation, Greensboro, N.C.) **Creative production in gifted young adults through simultaneous sensory stimulation.** *Gifted Child Quarterly*, 1970(Spring), Vol. 14(1), 46-55.—17 Ss were exposed weekly to simultaneous sensory stimulation including a signal from an oscillator, a phosphorescent Archimedes spiral wheel, incense, a floor vibrator, and music. Drawings were obtained before and after stimulation. The "after" drawings showed significant improvement as measured by scales devised by artists at the University of North Carolina. In addition, there were positive significant correlations between the "psychological openness" ratings of the drawings and creativity test scores.—S. Krippner.

4269. Torda, Clara. (City U. New York, Mt. Sinai Medical School) **Some observations on the creative process.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 107-126.—A study of formation of visual imagery during various conditions yielded observations supporting the assumption that the creative process reflects both special inborn qualities and a postpartum lifelong

adaptational process consisting of cultivation of mental mechanisms that significantly differ from the thinking processes of the average human. Better understanding of these mental mechanisms may promote our skills to help the newborn generation to develop their creative potentials fully. (134 ref.)—*Journal abstract.*

4270. Torrance, E. Paul & Khatena, Joe. (U. Georgia) "What kind of person are you?" A brief screening device for identifying creatively gifted adolescents and adults. *Gifted Child Quarterly*, 1970(Sum), Vol. 14(2), 71-75.—Describes a screening device for identifying creative adolescents and adults. Scores on this instrument were significantly related, in several validity studies, to (a) abilities to produce original images, (b) write original stories, (c) produce provocative questions, (d) have creative orientations, and (e) be motivated in creative directions. In addition, 175 graduate students in a creativity seminar scored significantly higher on this device than a control group of graduate students who had elected other seminars.—S. Krippner.

4271. Treadwell, Yvonne. (U.S. Air Force Directorate of Civilian Personnel, Personnel Research Group, Washington, D.C.) **Humor and creativity.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 55-58.—A pilot study of a Cartoons Test which required the creation of humorous captions showed a pattern of significant intercorrelations with several measures of creativity. Ss were 83 science and engineering undergraduates. Although work remains to be done to improve the scoring procedures and reliability of the Cartoons Test, results suggest that the study of humor is a useful approach to creativity research.—*Journal abstract.*

PERSONALITY MEASUREMENT

4272. Archer, G. S. & Burgess, Ian S. (U. Natal, Durban, South Africa) **A further investigation of sexually symbolic concepts using the semantic differential technique.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 369-372.—50 undergraduates responded to a semantic differential questionnaire designed to test the meaning of sexually symbolic concepts. 2 measures were used: the mean potency score and the mean score on the Masculine-Feminine (M-F) subscale. It was found that a number of discrepancies occurred between (a) mean potency and mean M-F scores, (b) mean potency score and predictions based on psychoanalytic theory, and (c) mean M-F scores and predictions based on psychoanalytic theory. The results are interpreted within a learning theory framework.—*Journal abstract.*

4273. Braun, John R. & Costantini, Arthur. (U. Bridgeport) **Faking and faking detection on the Personality Research Form, AA.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 516-518.—94 undergraduates were administered the Personality Research Form, AA under honest or best impression directions. Although the magnitude of the faking effects was small, mean scores on 12 of the 22 variables were significantly affected by the faking instructions. The desirability scores showed limited usefulness in detecting faking.—E. J. Kronenberger.

4274. Cotler, Sheldon; Quilty, Robert F., & Palmer, Richard J. (Indiana U.) **Measurement of appropriate and unnecessary help-seeking dependent behavior.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 324-327.—Help-seeking dependency was

defined in terms of requesting assistance which was not objectively necessary for attaining a specific goal. 30 undergraduate female Ss answered, in writing, each of a series of 40 factual questions. Ss then had an opportunity to request help from a confederate before providing a final oral answer to E. S's responses were classified in 1 of 4 categories: independent correct, independent incorrect, incorrect answers for which Ss appropriately sought help, or correct answers for which Ss sought help unnecessarily. The procedure yielded a reliable and unambiguous distinction between appropriate and unnecessary help seeking which served as an operational definition of help-seeking dependent behavior. Results indicate that help seeking was not related to the Ss' knowledge of the answers, and that Ss made significant discriminations among all 4 categories of responses on a confidence scale. (20 ref.)—*Journal abstract.*

4275. Craddick, Ray A. & Miller, John R. (George State U.) **Investigation of the symbolic self using the concentric circles method and animal metaphor.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 147-150.—Used an exploratory investigation having 36 undergraduates conceptualize themselves as a series of concentric circles (each circle representing a layer of personality) to investigate the self concept. Measurements of the diameters of the outer and inner self could be done with high reliability. Further, the use of the animal as a metaphor to symbolize further the various layers of the self was explored and appears satisfactory for further research. Some speculations as to the direction of future research with this method and the animal metaphor technique are discussed.—*Journal abstract.*

4276. Craddick, Ray A. & Worthy, Morgan. (Georgia State U.) **Reply to Archer and Burgess on their investigation of symbolic concepts using the semantic differential technique.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 373-374.—Suggests that results of G. S. Archer and I. S. Burgess' (see PA, Vol. 45:Issue 4) study which used the Masculinity-Femininity scale of the potency factor of the semantic differential to investigate symbolic concepts are not basically different from those obtained in M. Worthy and R. A. Craddick's (see PA, Vol. 43:9724) investigation which used only the mean potency scores. It is argued that use of the total score yields "higher reliability, multi-perspective approach, and increased likelihood of measuring elements of the unconscious."—M. West.

4277. Crego, Clyde A. (6709 Bracken Court, Springfield, Va.) **A pattern analytic approach to the measure of modes of expression of psychological differentiation.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 194-198.—Included the dimension of internalization-externalization in an expansion of H. A. Witken's dual-variable model for linear relations to a multivariate model for unrestricted relations in the study of psychological differentiation. Based on pattern analytic theory and methods, the configural model is used in the search for patterns of persons representing theoretical expectancies among dimensions of field dependence-independence, repression-sensitization, and internalization-externalization. Patterns are sought and found which reflect adaptive and maladaptive functioning with regard to the unique interaction among the 3 dimensions across persons. Patterns describing adaptive functioning at all levels of differentiation are also

found. Emergence of patterns which meet theoretical expectancies and nonemergence of patterns which do not, point to the facility of the configural measurement approach when using a mediating variable possessing behavioral attributes.—*Journal abstract.*

4278. Deo, Pratibha & Hundal, B. S. (Punjab U., Chandigarh, India) **Self-concept types by Q-technique.** *Journal of Psychological Researches*, 1969, Vol. 13(1), 1-11.—Factor analysis of a 48-statement Q-sort revealed 3 factors. Based on the loadings of each 5 on each of these factors, self-concept types were formulated as pure (high loading on only 1 factor) and mixed (high loading on more than 1 factor) types. Factor I revealed a self-concept with lack of social adjustment but positively weighted in temperament, intellectual ability, and character. Factor II represented a self-concept of negative temperament and intellectual ability, but better social adjustment and good character. Factor III represented a positive self-concept on all 4 variables. 3 Ss did not show loadings on any of these factors and were classified as "no types."—*U. Pareek.*

4279. Eisenman, Russell & Platt, Jerome J. (Temple U.) **Authoritarianism, creativity, and other correlates of the Famous Sayings test.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 267-271.—Compared the 4 subscales of Bass's Famous Sayings test with brief measures of authoritarianism, creativity, extraversion, response acquiescence, and moral judgments in mitigating circumstances. Intercorrelations among the subscales of Bass's test were similar to those obtained by R. N. Vidulich and M. Bass (see PA, Vol. 35:2215), while correlations with the other personality tests showed several significant relationships consistent with expectations. Hostility correlated significantly with both authoritarianism (.26) and creativity (.40) for 59 undergraduates.—*Journal abstract.*

4280. Gerjuoy, Herbert & Aaronson, Bernard S. (Human Resources Research Organization, Div. 3, Presidio of Monterey, Calif.) **Multidimensional scaling of terms used to describe personality.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 3-8.—Multidimensionally scaled the highest-intensity, lowest-intensity, and lowest-abnormality terms from 6 Buss-Gerjuoy dimensions. Expert judges estimated the correlations among the personality traits referred to by these terms. The mean estimates had a 2-dimensional configuration, abnormality and behavior elicitation-emission. Communications among psychologists should take into account psychologists' assumptions about trait intercorrelations. Psychologists perceive personality descriptions as redundant if the traits specified are believed highly correlated. Individuals with trait combinations not fitting the consensual model should be so characterized.—*Journal abstract.*

4281. Jones, Kenneth J. & Jones, Priscilla P. (Brandeis U., Florence Heller Graduate School for Advanced Studies in Social Welfare) **Contribution of the Rorschach to description of personality structure defined by several objective tests.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 35-45.—Administered the CTMM, the Kuder Preference Record, the Guilford-Zimmerman Temperament Survey and the standard Rorschach to 178 male high school juniors. The 4 batteries of scores were analyzed using Horst's method of canonical correlation over several sets of measures. Data yielded 4 profiles of scores interpreted as those of class leader, introvert, debater, and athlete. The

Rorschach did not overlap with the 3 objective tests; however, its profiles were not inconsistent with the other batteries.(21) ref.—*Journal abstract.*

4282. Khatena, Joe. (Marshall U.) **Note on reliability and validity of Onomatopoeia and Images.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 86.—A 2nd assessment of Onomatopoeia and Images using 185 undergraduates reported interscorer, test-retest, and split-half reliability coefficients of from .79-.99. Validity indices using 4 criterion measures, i.e., Sounds and Images, Product Improvement and Unusual Uses Test, What Kind of a Person Are You? Test, and creative self-ratings, were also reported to range from .31-.56 ($p < .05$).—*Author abstract.*

4283. Macedo, Rosa M. (Pontificia Universidade Católica de São Paulo, Brazil) **"O Teste Z" em adolescentes.** [The Zulliger Test for adolescents.] *Revista de Psicologia Normal e Psicológica*, 1968(Jan), Vol. 14(1-2), 3-47.—Administered the Zulliger (Z) Test slides to 250 14-16 yr. old Brazilian high school students to: (a) establish norms for Brazilian students and compare them with those of the Z Test in Switzerland and the Daninos in France, and (b) verify whether the Z Test sufficiently identifies age differences as to means, percentages, and quality of determinants. Results demonstrate that the Z Test is sufficiently sensitive and a useful instrument for the practice of psychology, for the identification of pathological cases, and as a means to describe Ss' personalities from a structural viewpoint. (French summary) (24 ref.)—*English summary.*

4284. McCarthy, Dorothea; Anthony, Robert J., & Domino, George. (Fordham U.) **A comparison of the CPI, Franck, MMPI, and WAIS Masculinity-Femininity Indexes.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 414-416.—Compared the WAIS Masculinity-Femininity (M-F) index with 3 other measures of masculinity-femininity: the Femininity scale of the CPI, the Masculinity-femininity score of the Franck Drawing Completion Test, and the Mf scale of the MMPI. All 4 measures differentiated significantly between the sexes of 60 undergraduate Ss. The WAIS M-F index did not correlate significantly with any of the other measures for either sex and should not be interpreted as a personality indicator of sexual inversion or homosexuality. It represents solely sex differences in certain aspects of intellectual performance. (16 ref.)—*Journal abstract.*

4285. Neill, John A. & Jackson, Douglas N. (U. Guelph, Ontario, Canada) **An evaluation of item selection strategies in personality scale construction.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 647-661.—Evaluation sensitivity (ES) pertains to consistency in degree of expressed anxiety in situations in which an individual is being appraised. A pool of items was constructed pertaining to ES with respect to parents, peers, teachers, and officials. The final test contained 44 positive and 44 negative items. The ES and the Personality Research Form Desirability scale were administered to 2 randomly selected groups of university students of 122 each. Several item selection strategies were studied. All strategies but random item selection yielded high Kuder-Richardson Formula 20 coefficients; for 4 items the Kuder-Richardson's were approximately .6; for 40 items, .9. Correlations with desirability were highest in random and uncorrected biserial approaches and lowest in the bandwidth strategy.—*N. M. Chansky.*

4286. Neva, Edward & Hicks, Robert A. (Denver Public Schools, Psychological Services, Colo.) **A new look at an old issue: Manifest Anxiety Scale validity.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 406-408.—Investigated the efficacy of MA scale scores as a measure of situational drive level using 48 undergraduates. The MA scale was used as a dependent variable, i.e., it was administered while drive level was systematically manipulated. Drive state was varied at 4 levels by the induced muscular tension technique while heart rate (HR) and GSR activity were recorded. The physiological measures indicate that drive level was effectively varied; however, no meaningful relationship between MA scale scores and HR and GSR activity was observed. The intercorrelation between HR and GSR was low but significant.—*Journal abstract.*

4287. Pande, C. G. (Nagpur U., India) **Sex differences in field-dependence: Confirmation with Indian sample.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 70.—Administered H. A. Witkin's colored Embedded-Figures Test (EFT) to 70 male and 70 female undergraduates to find whether sex difference in field-dependence, observed earlier, also exists for an Indian sample. Women were found to be significantly more field-dependent than men as found in earlier investigations with American and Western European samples. Some differences from Witkin's original results are demonstrated. Ss' consistency throughout the trials of EFT and its reliability as a measure of field-dependence are noted.—*Author abstract.*

4288. Philip, Alistair E. (U. Edinburgh, Scotland) **Reliability and equivalence in the Eight-Parallel Form Anxiety Battery.** *British Journal of Psychology*, 1970(Nov), Vol. 61(4), 517-520.—Administered the Eight-Parallel Form Anxiety Battery to 19 female undergraduates on 2 separate occasions. Differences between Ss and test forms were found, but there were no differences in scores between occasions, nor was there any interaction between test forms and occasions. Test-retest reliabilities of the forms were found to be satisfactory. Equivalence reliabilities between the forms were found to be greater for measurements made on the same occasion than for measurements made on different occasions; also correlations between the forms were higher on the 2nd occasion. It is concluded that more information of a normative nature is required before this promising instrument can be used in nonexperimental work.—*Journal abstract.*

4289. Platt, Jerome J., Eisenman, Russell, & Darbes, Alex. (Hahnemann Medical Coll. & Hosp., Community Mental Health Center, Philadelphia, Pa.) **Self-esteem and internal-external control: A validation study.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 162.—Presents a validation study of R. C. Ziller, J. Hagey, M. D. Smith, and B. H. Long's (see PA, Vol. 43:11315) self-esteem measure. 91 undergraduates were administered the Rotter I-E scale and the Ziller self-esteem measure. Results did not support the construct validity of the self-esteem measure.

4290. Stein, Kenneth B. & Lenrow, Peter. (U. California, Berkeley) **Expressive styles and their measurement.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 656-664.—Presents theoretical formulations concerning the motoric, ideational, and sensory-perceptual expressive dimensions. The dimensions are defined as general orientations toward the world of objects including the self. The development

of the Motoric Ideational Sensory Test (MIST) as an instrumentation for the measurement of the dimensions is described. A sample of 91 male and 96 female undergraduates served as Ss for the MIST development. A 2nd sample of 133 female and 116 male Ss were utilized for a test-retest reliability study, and for observing sex differences. Following the test development, 8 expressive style types were derived representing homogeneous sets of pattern scores across the 3 dimensions. The validity of the expressive styles was then studied in relation to classes of variables pertaining to personality and cognitive factors. (19 ref.)—*Journal abstract.*

4291. Tolor, Alexander. (Fairfield U., Inst. for Human Development) **Interrelationships among scales of a verbal psychological distance measure.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 520-522.—A verbal psychological distance measure was administered to 205 male and 128 female undergraduates to examine the psychological distance clusters that emerge from this technique. Intercorrelations for the 7 concepts are presented and indicate generally low-order correlations, with 14 out of 42 being significant. Females responded with greater independence to the target figures than did males. There were sex differences regarding common distance reactions to the figures. The highest positive correlation for males was for the psychological distance between the 2 parental figures. It is suggested that men tend to develop a much more generalized desire for closeness or aloofness to both parents than do females.—*E. J. Kronenberger.*

Inventories

4292. Armentrout, James A. (St. Louis U., Medical School) **Correspondence of the MMPI and Mini-Mult in a college population.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 493-495.—High correlations were found in almost all instances between Mini-Mult and MMPI scores for the separate scales using a college population of 164 Ss. Using profile pairs for individual Ss showed that the Mini-Mult profile permitted few conclusions as to validity, high points, or general elevation of its associated MMPI profile. In general, it was felt that there was a disappointing lack of correspondence between the MMPI and Mini-Mult and that this research discouraged the use of the Mini-Mult with college students.—*E. J. Kronenberger.*

4293. Bhushan, L. I. (Bhagalpur U.) **A Hindi version of Eysenck Personality Inventory (Form A).** *Psychology Annual*, 1969, Vol. 3, 27-30.—Describes the construction and standardization of Eysenck's Personality Inventory (Form A) translated into Hindi. The test was translated with the help of language experts. Split-half and test-retest reliabilities for the Extraversion, Split-half and test-retest reliabilities, respectively, were .78, .69, .73, and .76. Validity coefficients as calculated by administering both English and Hindi versions to postgraduate students were .89 and .84, respectively, for both scales. Norms are reported in terms of means and standard deviations for different age groups and political party members.—*U. Pareek.*

4294. Braun, John R. & Tinley, John J. (U. Bridgeport) **Faking study of scores on the Self-Perception Inventory.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 118.—Investigated fakability of the Self-Perception Inventory (SPI) using 17 undergraduates with fake good

instructions and 20 with fake bad. Scores on all but 1 of the 11 scales (Rigidity-Dogmatism) were significantly affected in appropriate directions by the opposed faking instructions ($p = .002$). With 4 scales, the distributions of scores for the opposed instructions showed no overlap. Results show the SPI is grossly transparent when applied to undergraduates.—*Author abstract*.

4295. Butcher, James N. (Ed.) (U. Minnesota) **MMPI: Research developments and clinical applications**. New York, N.Y.: McGraw-Hill, 1969. xiv, 402 p. \$9.95.—Various authors including W. G. Dahlstrom, R. D. Fowler, and J. S. Wiggins present their research on the development and clinical application of the MMPI and discuss controversies currently surrounding its use. Discusses use of computers for automatic MMPI interpretation, development of content scales, and the "invasion of privacy" issue.

4296. Gaines, L. S. & Fretz, B. R. (Maryland State Psychiatric Research Center, Baltimore) **Ego strength, social impression value of stimuli, and self-reference language**. *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 428-431.—Examined ego-strength and impression value of stimuli-verbs as 2 conditions hypothesized to influence the generation of self-reference statements. 60 male undergraduates who significantly varied in ego strength did not vary in their production of self-reference statements except when impression value of the stimuli was also considered. Significant differences obtained were diametric to hypothesized relationship. Results are considered in relationship to the repression-sensitization dimension.—*Journal abstract*.

4297. Gravitz, Melvin A. (Montgomery Coll., Takoma Park, Md.) **Validity implications of normal adult MMPI "L" scale endorsement**. *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 497-499.—Examined 6686 male and 4717 female MMPI L scale protocols for percentage of true-false responses. It was found that large numbers endorsed more than 1/2 of the items in the direction scored as deviant. Sex differences were noted. The validity of the scale was questioned.—*E. J. Kronenberger*.

4298. Mikesell, Richard H., Calhoun, Lawrence G., & Lottman, Thomas J. (U. Georgia) **Instructional set and the Coopersmith Self-Esteem Inventory**. *Psychological Reports*, 1970(Feb), Vol. 26(1), 317-318.—Studied effects of the manipulation of instructional set on the Coopersmith Self-Esteem Inventory for 29 high school boys and girls. Total self-esteem scores were significantly greater under the fake good instructional set than under either the control or fake bad set ($p < .01$); there were no significant sex differences or a significant interaction between sex and instructions. The Lie scores were significantly different for all 3 sets of instructions ($p < .01$), but there were no significant sex differences or interactions.—*Journal abstract*.

4299. Stehbins, James A. (U. Iowa, State Services for Crippled Children) **Comparison of MMPI scores of mothers of enuretic and control children**. *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 496.—Mothers of enuretic children scored significantly higher on the Pa scale of the MMPI than a control group of mothers. It was suggested that this finding could be due to chance factors.—*E. J. Kronenberger*.

Projective Techniques

4300. Carvalhaes Bonilla, Lúcia. (Pontificia Uni-

versidade Católica de São Paulo, Brazil) **Contribuição à fundamentação do Teste das Pirâmides Coloridas, de Pfister**. [A contribution to lay the Pfister Color Pyramid Test foundation.] *Revista de Psicologia Normal e Patológica*, 1968(Jan), Vol. 14(1-2), 82-90.

4301. Chu, Cheng-ping. **The remodification of TAT adapted to Chinese primary school children: I. Remodification of the pictures and setting up the objective scoring methods**. *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 59-73.—Discusses the 1st part of a study on remodification of TAT for Chinese primary school children. This involved preparing a set of applicable TAT pictures, and setting up objective administering and scoring methods in order to have a standardized test. The developing of TAT pictures is based on rationales which may provide a broader meaning in understanding personalities. The setting up of objective scoring methods has benefits in studies of larger samples or group comparisons. Most of the contents of scoring methods are developed from other studies and are checked by 12 representative Chinese primary school children's responses. The final scoring sheets are included.—*Journal abstract*.

4302. Chu, Cheng-ping. **The remodification of TAT adapted to Chinese primary school children: II. The application and evaluation of pictures**. *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 74-89.—Presents a 4-part study of the remodification of TAT adapted for Chinese primary school children: (a) the remodification of a new set of pictures, (b) the setting up the objective scoring methods, (c) the application of a new set of pictures in the developmental and comparative studies of children's TAT responses, and (d) the evaluations of each picture. These newly developed pictures and scoring methods will be useful for personality studies of children.—*Journal abstract*.

4303. Cuppens, E. C. **De WARTEGG-Teken-Test, Evaluatie van een omstreden techniek**. [The Drawing-Completion Test: Evaluation of a controversial technique.] *Gawein*, 1969(Jan), Vol. 17(1), 1-70.—Describes the Drawing-Completion Test and analyzes and evaluates the scoring systems developed by E. Wartegg, G. M. Kinget, D. Duhm, and M. Takala. The requirements the scoring-systems must meet when the test is used in a research-project are described. The content of the drawings is shown to offer a sample of the objects and situations that prevail in daily-life experiences of the person and to reflect the emotional loadings which they have in the person's own world of experiences. The writing-direction is identified as a response-set in the scores of the stimulus preference, and thematic concepts confining the process of stimulus perception during the test are described. Some restrictions to the use of the test in its present stage of development are mentioned. (28 ref.)—*English summary*.

4304. Hartman, A. Arthur. (Psychiatric Inst., Chicago, Ill.) **A basic TAT set**. *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 391-396.—The 10 TAT cards judges most valuable for a basic test set were selected by 170 highly experienced psychologists. Judges' choices, separately determined for adults and children, were very consistent and rankings of the 10 most frequently chosen cards were closely parallel in the adult and child series. Utilizing these findings a recommended Basic TAT set of 8 cards is proposed to enhance development of the TAT for clinical research and teaching purposes.—*Journal abstract*.

4305. Silvers, Damon & Wirls, C. J. (U. Maryland) **A determination of the symbolic meanings of the Kahn Test of Symbol Arrangement objects.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 401-408.—Attempted to determine the validity of the postulated common meanings for the Kahn Test of Symbol Arrangement (KTSA) symbols using the semantic differential to determine empirically Ss' reactions to the KTSA symbol objects. These responses were then used to confirm Kahn's postulated popular meanings for the symbols. The connotative meanings for the KTSA symbols were determined by the semantic differential ratings of 48 male and 48 female preadolescents. The findings confirmed Kahn's postulated meanings for some of the symbols, while others were only partially confirmed and still others were not confirmed at all. The semantic differential ratings were statistically significant 260 out of 336 possible times. The interpretive meaning of the results is discussed.—*Journal abstract*.

4306. Solar, Diana; Bruehl, Dieter, & Kovacs, John. (U. California, Los Angeles) **The Draw-a-Person Test: Social conformity or artistic ability?** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 524-525.—Presents and discusses correlations between conformity and the Draw-a-Person Test (.00), between the Sophistication of Body Concept Scale and Conformity (.01), between artistic ability and the Draw-a-Person Test (.74), and between the Sophistication of Body Concept Scale and artistic ability (.76). 40 female undergraduates served as Ss. Results suggest that scores on the figure drawing scales reflected artistic ability rather than conformity. It was felt that in the absence of specific validation it is highly questionable to base interpretations on mechanically scored scales derived from drawings of the human figure.—*E. J. Kronenberger*.

4307. Weisskopf-Joelson, Edith & Wexner, Lois B. (U. Georgia) **Projection as a function of situational and figural similarity.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 397-400.—Hypothesized that male Ss would project more on situations pertaining to the lives of men than on situations pertaining to the lives of women and that female Ss would project more on situations pertaining to the lives of women. It was further hypothesized that male Ss and female Ss would not differ with regard to the amount of projection elicited by male and female pictorial figures. Transcendence indices were used as measures of the amount of projection. Ss were 30 25-30 yr. old male college students and their wives. The 1st hypothesis was confirmed for men only. The 2nd hypothesis was confirmed for men and for women. (17 ref.)—*Journal abstract*.

Rorschach Test

4308. Ames, Louise B. (Gesell Inst. of Child Development, New Haven, Conn.) **Projecting the future of a projective technique.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 359-365.—Suggests that the waning influence of projective techniques does not signal the weakening of the Rorschach. The continuing usefulness of the Rorschach is discussed with regard to its effectiveness: (a) in determining changes which take place in human Ss as they mature, (b) in determining school readiness and

predicting academic success, (c) in measuring intactness of function in old age, (d) in measuring racial and socioeconomic differences, (e) as a supplement to the Lowenfeld Mosaic, (f) in differentiating somatotypes, (g) in determining perceptual problems and level of cognitive function, and (h) in predicting interpersonal behavior. (17 ref.)—*M. West*.

4309. Reisman, John M. (Memphis State U.) **The effect of a direct inquiry on Rorschach scores.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 388-390.—33 Ss were administered the Rorschach and had a traditional, nonleading inquiry. An equal number of Ss took the Rorschach and had a direct inquiry in which they were asked specifically whether or not a certain determinant had been relevant. Results indicate no significant difference in the numbers of determinants produced by the 2 groups. It is suggested that a standardized, direct inquiry would be of considerable value in administering and understanding the Rorschach.—*Journal abstract*.

4310. Sloane, Patricia. **The ink blot test, "psychodiagnostics" and Hermann Rorschach's aesthetic views.** *Journal of Aesthetics & Art Criticism*, 1970(Fal), Vol. 29(1), 106-119.—States that Rorschach's "assumption that color response is primarily a matter of individual psychology is open to question, as is Rorschach's negative view on color, and the negative overtones of some of his color terminology. Questionable, also, is the assumption that visual perception splits easily into a dualism of form versus color." It is pointed out that since the card forms are bisymmetrical they cannot be chance forms. They tend to elicit associations with objects (e.g., animals) which are bisymmetrical. Since Rorschach's death in 1922, art expression has grown more literal again and bright colors have come into fashion. The test, therefore, is not culture or time free for literal interpretations of the blots are now more to be expected. Special attention to the bright colors of the cards does not at present indicate emotionality. (16 ref.)—*P. R. Farnsworth*.

CLINICAL PSYCHOLOGY

4311. ———. **Protokoll der 12. Tannenfelder Tagung in Rahmen der Medizinisch-wissenschaftlichen Gesellschaft für Psychiatrie und Neurologie Leipzig am 29.5.1968 im Fachkrankenhaus für Neurologie und Psychiatrie Tannenfeld.** [Protocol of 12 days at Tannenfeld of the Scientific-Medical Society for Neurology and Psychiatry in Leipzig on May 29, 1968 at the Tannenfeld Specialty Hospital for Neurology and Psychiatry.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(May), Vol. 22(5), 191-192.—Presents brief abstracts of the 6 papers presented. 3 papers were on aspects of myasthenia; the other 3 were on blindness and paranoid syndrome, culpability of juvenile social drinkers in Dresden, and the case of a killing of a child by its schizophrenic mother.—*K. J. Hartman*.

4312. Antebi, R. N. (Eastern District Hosp., Glasgow, Scotland) **State benefits as a cause of unwillingness to work.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 205-206.—When a worker learns of the social benefits offered to the unemployed, or a poor worker with 3 or 4 children inflating the welfare income becomes ill or unemployed, an intractable syndrome beyond the

help of a psychiatrist may ensue. Attitudes of the wife may discourage a return to work, in part because he releases her from part of the load of child care. Symptomatology is similar to that of compensation neurosis with an average age of onset of 42, reports of poor sleep, poor concentration, anxiety, irritability, weakness, and various somatic complaints.—*R. L. Sulzer.*

4313. Appelbaum, Stephen A. (Menninger Foundation, Topeka, Kan.) **Science and persuasion in the psychological test report.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 349-355.—Psychological test reports are different from traditional medical reports. Rather than solely technical or scientific documents, they are political, diplomatic, strategic persuasions functioning in a complex socio-psychological context. Some principles of writing test reports from this viewpoint are included. (24 ref.)—*Journal abstract.*

4314. Belciugăteanu, C. **Arta și dialectica sănătății și morbidității psihice.** [Art and the dialectics of health and psychic morbidity.] *Neurologia, Psihiatria, Neurochirurgia*, 1968(Mar), Vol. 13(2), 109-118.

(Columbia U., Coll. of Physicians & Surgeons) **Videotape techniques in psychiatric training and treatment.** New York, N.Y.: Brunner/Mazel, 1970. xv, 303 p. \$15.—Presents a comprehensive overview by leading experts in the field on all aspects of the use of videotape in psychiatry, including theory and practice, training and treatment, legal and ethical considerations, and technical and artistic guidance.

4316. Caudill, William & Lin, Tsung-Yi. (Eds.) (National Inst. of Mental Health, Bethesda, Md.) **Mental health research in Asia and the Pacific.** Honolulu, Hawaii: East-West Center Press, 1969. xv, 487 p. \$12.50.—Presents papers prepared for the 1966 Conference on Mental Health Research in Asia and the Pacific. Topics by various authors include: (a) issues in the identification and study of mental illness, (b) the effects of social structure and culture on human behavior, and (c) criticism of the preceding discussions and suggestions for training and research.

4317. Ellinwood, Everett H. (Duke U., Medical Center) **Perception of faces: Disorders in organic and psychopathological states.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 622-646.—The face is a unique highly charged percept in humans. Little is known of the normal vicissitudes of perception of faces and less about its disorders. The disorders include prosopagnosia, false recognition, the syndromes of Fregoli and Capgras, perceptual distortions, hallucinations, and hypercathexis of faces. Many of the disorders are found in diseases of both organic and psychological origin. Several "of the disorders that elucidate some of the mechanisms involved in perception of faces" are presented, and "the position that the more primitive aspects of these mechanisms are involved in certain paranoid psychopathological states" is taken. (62 ref.)—*D. Prager.*

4318. Ey, H., Bernard, P., & Brisset, C. **Manuel de psychiatrie.** [Handbook of psychiatry. (3rd ed.)] Paris, France: Masson, 1967. 1211 p.—A manual for the specialist and the general practitioner. Materials are presented on the clinical picture, treatment, and prophylaxis of mental diseases "from the viewpoint of the clinical facts (old and new) and from that of the theoretical bases of psychiatry."—*I. D. London.*

4319. Feuerhahn, G. & Vater, D. (Wilhelm Greisinger Hosp., Berlin, W. Germany) **Über Schlafgewohnheiten, Schlafstörungen und Schlafmittelverwendung in einem Berliner Wohngebiet.** [Sleeping habits, sleep disorders and use of soporifics in a residential section in Berlin.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(May), Vol. 22(5), 182-185.—Analysis of results of 4000 interviews of residents of a newly constructed residential district in Berlin reveals widespread disturbance in sleeping habits, general decrease in length of hours of sleep, and an increased use of soporifics. Members of more intellectual occupations reported more disturbances than those in physical occupations. Women in all socioeconomic levels reported higher rates of sleep disorders.—*K. J. Hartman.*

4320. Fraas, Louis A. & Mathes, Eugene W. (249th General Hosp., APO San Francisco, Calif.) **Aspirations and concerns of hospitalized psychiatric and medical casualties evacuated from the Republic of Vietnam.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 149-156.—Aspirations and concerns of United States Army medical and psychiatric casualties were reviewed and compared to an earlier study by K. G. Garrison (see PA, Vol. 40:12178) involving 9th graders. Psychiatric patients (N = 36) were more concerned about their present life and future personal status, whereas medical patients (N = 85) were more cognizant of future business and financial success. Medical Ss expected to marry earlier, and make more money than psychiatric Ss. The 9th graders were more aware of home and school influences in their lives. Overall, aspirations and concerns seem rather fluid, and mirror present conditions.—*Journal summary.*

4321. Haley, Jay. (Child Guidance Clinic, Philadelphia, Pa.) **The power tactics of Jesus Christ and other essays.** New York, N.Y.: Grossman, 1969. 146 p. \$4.95.

4322. Hocking, Frederick. (Alfred Hosp., Melbourne, Victoria, Australia) **Psychiatric aspects of extreme environmental stress.** *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 542-545.—Discusses the reactions of individuals subjected to severe environmental stress. Childhood rearing patterns and differing constitutional factors can influence reactions to normal stress, however, there is increasing evidence that under severe or prolonged stress, these factors will, at most, only postpone the onset of neurotic responses. Emotional reactions to various forms of severe biological stress, including starvation, sensory deprivation, and natural and man-made disasters (e.g., military combat, concentration camps, atomic bombing, etc.) are reviewed. It is concluded that susceptibility to stress in humans follows a normal curve of distribution rather than a 2-category classification of "normal" and "predisposed" to breakdown. (27 ref.)—*P. McMillan.*

4323. Inglis, James. (Queen's U., Kingston, Ontario, Canada) **Shock, surgery and cerebral asymmetry.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 143-148.—Shock effects on memory and learning ability resemble results of temporal lobectomy, perhaps because the site of the 2 procedures is the same. These parallels imply a pressing need for discovery of other modes of ECT that interfere less with the normal brain activities. (32 ref.)—*R. L. Sulzer.*

4324. Kennedy, James F. (Smith Coll., School for Social Work) **Implications of grief and mourning for mothers of defective infants.** *Dissertation Abstracts*

International, 1970(Jul), Vol. 31(1-A), 472-473.

4325. Klages, W. **Der menschliche Antrieb: Psychologie und Psychopathologie.** [Human motive forces: Psychology and psychopathology.] Stuttgart, W. Germany: Georg Thieme, 1967. 128 p.—Attempts to cover a very wide range of varied psychological and psychopathological problems from the viewpoint of "motivation and its disorders." "Motivation" is understood as including not only "psychic functions and their disorders," but as in partial coincidence with such more general philosophical concepts as "will, psychic activity, psychic energy, spontaneity [Eigenantrieb], etc."—*I. D. London*.

4326. Lin, Pi-fong & Yen, Fang. **A study of psychological after-effect of the contraceptive operation of tubal ligation.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 90-104.—Describes 2 experiments in which 92 female Ss and 59 female Ss, respectively, were given the MMPI. 11 personality scales (Ar, D, Es, Mf-F, N, Mfl, Im, Sp, Ao, Sr, and Sv) and 55 items were included in Exp. I. In Exp. II only 5 personality scales (Hs, Hy4, At-s, Ma3, H1) and only 63 items were included. Results of Exp. I show that most Ss after tubal ligation have more emotional maladjustment than those who have not received tubal ligation. However, the small number of Ss and construction of the inventory decrease the reliability of this result. Results of Exp. II show that there is no significant difference between the 2 means of all groups on all scales at the .05 level.—*Journal summary*.

4327. Mefferd, Roy B., Houck, Robert L., & Sadler, Timothy G. (Veterans Administration Hosp., Houston, Tex.) **Perceptual categorization: Factors influencing the reproduction of spoken sounds delivered at suprathreshold levels without masking.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 71-78.—45 Ss with normal hearing who were patients of 3 clinical categories receiving phenathiozine medication repeated phonetic stimuli received via an earphone under standard audiological testing conditions. Errors in reproduction of common words (compound spondaic words, monosyllabic homonyms and nonhomonyms), common prefixes and suffixes, nonsense syllables, and common words pronounced backward occurred least (2%) with the compound words, and they increased monotonically in the order given above to a frequency of 36% with the backward words. This result was interpreted as being due to the manipulation of the level of perceptual readiness and of the processes of categorization involved in classification of the stimulus in systematic and specific ways. This was accomplished variously by alteration of the expectancies relative to the phonetic, syntactic, or semantic nature of succeeding stimuli, and to differences in the relative availability in memory of matching information caused by differences either in familiarity with the stimulus or in the range of meanings associated with the stimulus. (38 ref.)—*Journal abstract*.

4328. Müller, C., Ciompi, L., & Medvecka, J. (U. Lausanne, Switzerland) **Mortalité, survie et causes de décès dans la paralysie générale.** [Mortality, survival and causes of death in general paralysis.] *Social Psychiatry*, 1970(Jul), Vol. 5(3), 121-128.—Studied 320 cases of persons, born between 1873 and 1897, who suffered from general paralysis. Data show that mortality was substantially higher in these Ss than in the general population. The mean age at the time of 1st admission (and probably, therefore, at 1st onset) was 45. Male Ss

survived an average of 6.3 yr. after admission and women 5.3 yr. This is 7.8 yr. less for men and 9.8 yr. less for women than the life expectancy of the general population. Deaths occurred during a 60-yr period; during the last 2 decades, the death rate was lower. Clinical complications of other kinds tended to lower the death rate because they necessitated longer hospitalization and treatment. In many cases the only illness present at death was general paralysis, although there was also a high incidence of respiratory and circulatory diseases. Cancer was significantly less frequent as a cause of death at the beginning of the period of observation, but became more frequent later. Suicide was slightly less frequent than in the general population, but differences were not statistically significant. (German abstract) (19 ref.)—*English abstract*.

4329. Polak, Paul. (Ft. Logan Mental Health Center, Crisis Intervention Div., Denver, Colo.) **Patterns of discord: Goals of patients, therapists, and community members.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 277-283.—Studied the extent of agreement in treatment goals between mental patients and their therapists. Ss were 11 patients at a United States urban mental health center and 7 patients at a rural hospital in Scotland. Semistructured interviews were administered to Ss and a parallel schedule to staff members. Results suggest: (a) a wide variation in patient and therapist conceptions of the desired content of treatment goals; (b) at time of admission, there is low agreement among therapist, family, and community members with the patient's goals; (c) the staff's values have a biasing effect on their predictions of patient values; and (d) significant interstaff agreement exists.—*P. McMillan*.

4330. Rae-Grant, Quentin & Roberts, C. A. (U. Toronto, Ontario, Canada) **Adult and child psychiatry: One or two nations?** *Canadian Psychiatric Association Journal*, 1970(Jun), Vol. 15(3), 247-252.—Reviews the development and present status of child psychiatry as a subspecialty of general psychiatry. It is noted that the mental health needs of children were late in being given appropriate attention in both Canada and the United States. Child psychiatry is now struggling to identify itself as a subspecialty in its own right, yet sharing common goals. A written discussion by C. A. Roberts emphasizes the need for effective interrelationships with all health groups in order to assure comprehensive services.—*P. McMillan*.

4331. Raknes, Ola. **Wilhelm Reich and orgonomy.** New York, N.Y.: St. Martin's Press, 1970. 130 p. \$5.95.

4332. Riedel, Wolfgang W. (Catholic U. of America) **An investigation of personal constructs through nonverbal tasks.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 173-179.—Attempted to devise essentially nonverbal procedures for the measurement of a person's role constructs as defined by G. H. Kelly. This procedure was adopted to allow the extension of personal construct theory to the social psychological realm. The graphic procedure would have the additional value of opening up approaches to personality measurement with S groups (i.e., young children and handicapped Ss) that cannot adequately respond to verbal materials. 2 studies compared 49 6th graders with 49 12th graders and 50 neuropsychiatric with 50 medical patients on the Personal Construct Inventory, specifically constructed for this purpose and pretested with 177 Ss. 6 hypotheses were tested in each study, with 5 out of 6

finding confirmation in both investigations. Results indicate the hypotheses about the nature of role constructs are tenable and merit further investigation. The feasibility of the graphic approach to measurement is illustrated.—*Journal abstract.*

4333. Rokhlin, L. L. *Ocherki psikhatrii*. [Essays in psychiatry.] Moscow, USSR: RSFSR Ministry of Public Health, 1967. 390 p.—The monograph, published as an unnumbered issue of *Trudy Moskovskogo nauchno-issledovatel'skogo instituta psikhatrii* [Transactions of the Moscow Research Inst. of Psychiatry], provides a historical treatment of "almost all the main problems of contemporary psychiatry" within the context of the social-historical development of society at any given stage. A special chapter is devoted to the bases of the Pavlovian theory of higher nervous activity and its significance for psychiatry.—*J. D. London.*

4334. Schneider, P. B., et al. (U. Lausanne, Switzerland) *Contribution à l'étude de la psychiatrie ambulatoire: II. Comparaisons à l'intérieur de la clientèle d'un service ambulatoire*. [Contribution to the study of outpatient psychiatry: II. Comparisons of clientele of an outpatient service.] *Social Psychiatry*, 1970(Jul), Vol. 5(3), 128-154.—Presents the 2nd part of a study on psychiatric epidemiology carried out in the canton of Vaud in Switzerland. The 1st part studied the ratio between the canton's population and the number of patients attending a local psychiatric outpatient clinic. These patients were studied in the 2nd part on the basis of the same epidemiological criteria (sex, origin, residence, age, civil status, religion), plus occupation. Clinical characteristics of Ss (i.e., diagnosis, manner and reason for attendance, and type of intervention) were studied and related to the above factors. Clinic patients and patients of private psychiatrists were compared. Hypotheses are presented on the basis of results obtained. (German abstract)—*English abstract.*

4335. Seelig, Mildred S. *Vitamin D and cardiovascular, renal, and brain damage in infancy and childhood*. *Annals of the New York Academy of Sciences*, 1969(Sep), Vol. 147(15), 537-582.—Excess intake of vitamin D is implicated in a number of serious diseases of childhood characterized by cardiovascular, renal, and brain damage. A syndrome of supravalvular aortic stenosis, mental retardation, and characteristic facies seems associated with receiving massive doses of vitamin D in infancy and childhood. This syndrome occurs more commonly in white than black infants and seems related to racial susceptibility to vitamin D. (160 ref.)—*B. S. Aaronson.*

4336. Siomopoulos, V. (Illinois State Psychiatric Inst., Chicago) *On form and similarity in mental functioning*. *Psychoanalytic Review*, 1969, Vol. 56(3), 415-424.—"Thinking in terms of formal similarities is a universal principle of mental functioning. . . . Feeling in terms of similarities may also be crucial for mental functioning in normal conditions as well as in psychopathology." Theories and clinical examples are discussed where similarity of cognitive forms is involved in 1 or another way.—*D. Prager.*

4337. Sperber, Michael A. *Sensory deprivation in autoscopic illusion, and Joseph Conrad's "The Secret Sharer."* *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 711-718.—The role of sensory deprivation and sensory monotony in autoscopic illusion and autoscopic hallucination is discussed. Other factors—especially intrapsychic conflict—also seem to be involved. The

relationships of these factors are considered, using J. Conrad's *The Secret Sharer* as a basis of reference.—*Journal summary.*

4343. Baca Baldomero, E., Madoz, V., & Muñoz Rodríguez, P. E. *La formación de enfermeras psiquiátricas: Resultados de una primera experiencia*. [Training of psychiatric nurses: Results of a preliminary experiment.] *Revista de Medicina de la Universidad de Navarra*, 1968(Sep), Vol. 12(3), 227-240.—Discusses the planning and development of an experimental psychiatric training course for nurses, based on the idea of the psychiatric nurse as an active member of the therapeutic team. Emphasis is placed on the formative aspects of teaching by making the students responsible for their own process of learning, and examination systems are reviewed according to this idea. It is concluded that less directive, more personal teaching is not utopic, but it is feasible and highly recommended. An appendix with a list of courses is included.—*English summary.*

4344. Castelnovo-Tedesco, Pietro. (Harbor General Hosp., Torrance, Calif.) *Psychiatric residents' appraisal of psychiatric teaching in medical schools*. *Comprehensive Psychiatry*, 1969(Nov), Vol. 10(6), 475-481.—A questionnaire was distributed to 218 psychiatric residents and fellows from 9 training programs in the Los

Angeles area. Of the final sample of 101, 16% considered psychiatry the poorest taught subject although only 4% considered it the least learned subject, 37% thought the teaching of psychiatry had been either poor or indifferent. About $\frac{1}{3}$ had decided to specialize in psychiatry before medical school, $\frac{1}{3}$ during medical school, and $\frac{1}{3}$ after medical school. 44% had never received instruction in psychotherapy, 31% had never treated a patient with psychotherapy, and 82% were confident that psychotherapy was an effective form of treatment. All felt that psychiatry in medical school was directed mainly at the future nonpsychiatrist. The most prized features of training were contact with dedicated teachers and generous opportunity for clinical experience.—D. Prager.

4345. Dinoff, Michael; Finch, A. J., & Clements, Carl B. (U. Alabama) **Testing clinical judgment during a crisis.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 181-182.—Following the disaster, Hurricane Camille, 250 patients were transferred from 1 neuropsychiatric hospital to another. In making arrangements to accept and accommodate new patients, rapid decisions had to be made to relocate patients within the hospital. The staff transferred patients from a regressed geriatric unit to 1 of 3 units based upon subjective decisions as to the patients' capacity to care for themselves. Follow-up data with the Minimal Social Behavior Scale show that they made accurate decisions.—*Journal abstract.*

4346. Fordham, Michael. **Reflections on training analysis.** *Journal of Analytical Psychology*, 1970(Jan), Vol. 15(1), 59-71.—Discusses the subject of training analysis in light of the training situation. A basic assumption was that 1 analyst conduct the training analysis if the preoedipal conflict patterns are to be worked through. Training analysis provides the trainee with experience which can serve as the basis for his future work. Analysis during formal training is a part of the trainee's efforts to integrate what he learned intellectually with his own personal experience. (19 ref.)—P. Federman.

4347. Hines, Laura. (Temple U., Community Mental Health Center) **A nonprofessional discusses her role in mental health.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1467-1472.—Presents an autobiographical account of 1 woman's training period as a mental health assistant. The account includes her current work with patients, home visiting, work with child and parent groups, and the homemaking service at the community mental health center. It is concluded that a more effective mental health program is needed on the local level because the present program is in need of expansion of services in order to encompass the wide range of community problems.—P. R. Shibelski.

4348. Lynch, Mary & Gardner, Elmer A. (Temple U., Community Mental Health Center) **Some issues raised in the training of paraprofessional personnel as clinic therapists.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1473-1479.—Explores the Temple University Community Mental Health Center's training program, instituted in 1966, for the paraprofessional mental health assistant. The programs curriculum (i.e., language skills, health care, health patterns, black identity, social issues, psychological development, psychiatric interviewing, psychiatric pathology, literature seminar, observation sensitivity, and communication) is described. A definition of "helper" includes the characteristics which are the basis of the mental health assistant. Questions of supervision, the role of the

psychiatrist (supervisor or administrator), the career ladder for the paraprofessional, and the paraprofessional's effect upon the organization are discussed in an attempt to understand the role of the paraprofessional and the place of the program in the community and professional world. (17 ref.)—P. R. Shibelski.

4349. Plutchik, Robert; Klein, Morris M., & Contes, Hope. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Some factors related to the selection of clinical psychology interns.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 449-452.—A 21-item, 9-point Psychology-Intern Rating Scale was developed and 60 candidates were interviewed and rated by 2-4 supervisors. An overall score was computed for each candidate and correlations between pairs of raters were determined. The correlation between overall scores and global ratings was .83. Discriminating items dealt with complaining, sensitivity to others, academic preparation, self-awareness, emotional stability, independence, problem-solving ability, and probable response to criticism. Items dealing with likability, personal appearance, openness, and leadership potential failed to discriminate between the groups.—E. J. Kronenberger.

4350. Raybin, James B. & Detre, Thomas P. (Fitzsimmons Army Hosp., Denver, Colo.) **Sleep disorder and symptomatology among medical and nursing students.** *Comprehensive Psychiatry*, 1969(Nov), Vol. 10(6), 452-462.—Reports on the quality and quantity of sleep disorder among a normal group of 139 medical and nursing students. About 20% of the total population reported a disturbance of sleep. Sleep disorder data were also correlated with a variety of psychiatric symptoms reported by the same group. The wide discrepancy between the medical and nursing students for sleep disorder and other symptoms is discussed. This questionnaire study proved to be only marginally helpful in differentiating a subgroup of nursing school dropouts from the nursing students who stayed in school. A past or current history of psychiatric treatment did not correlate with any of the sleep disorder or other symptom variables. (27 ref.)—*Journal summary.*

4351. Ryan, James H. & Budner, Stanley. (New York State Psychiatric Inst., New York) **The impact of television: An evaluation of the use of videotapes in psychiatric training.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1397-1403.—A study conducted at the New York State Psychiatric Institute evaluated the effectiveness of videotape materials in the training of psychiatric residents. The experimental resident (TV) group (N = 34), and the resident control ("live" teaching) group, were objectively compared as to knowledge, skills, and attitudes. Each group was taught in 10 weekly sessions in psychiatry and neurology. A quiz was administered upon completion of the trial to determine the comparative knowledge scores; an interview was given to determine the skills scores; and, the Senior Psychiatrist Value Scale and Resident Psychiatrist Value Scale was administered to determine attitudinal scores. On the knowledge and skills scores, the TV group scored higher than the control group; but, on the attitude scale, the scores were nearly equal. It is concluded that TV teaching methods seem to be as good as or possibly better than live methods in resident training. (15 ref.)—P. R. Shibelski.

4352. Sampaio, Norival; Bruni, Carlos, & Araujo, Moema. (U. Federal da Bahia, Brazil) **O ensino da psicologia no curso médico: Medicina psicos-**

somática. [Psychological study in medical course: Psychosomatic medicine.] *Revista de Psicologia Normal e Patológica*, 1968(Jan), Vol. 14(1-2), 74-81.—Explains a 4th-yr program in psychosomatic medicine in which students have special training for 45 days, 8 hr/wk, discussing with psychiatrists and psychologists cases of psychosomatic syndromes. The program includes seminars in interpretation of the meaning of psychosomatic syndromes and psychodynamic aspects of personality, how to manage the doctor-patient relationship, and the medical use of psychological tests. Progress and difficulties of the program are discussed, and it is concluded that the importance of the program is in integrating psychiatric knowledge into the activities of the general practitioner.—*English summary.*

4353. **Singer, Paul R. & Muslin, Hyman L.** (U. Illinois, Medical Coll.) **Evaluation and teaching of psychiatric interviewing.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 371-376.—Describes 3 variables interacting in the production of the novice interviewer's learning: (a) a common core of values and techniques shared by experts, (b) the personal style of an expert implicitly communicated to the novice, and (c) the inarticulated personal style of the novice. An appeal is made for research aimed at making these variables explicit in order to define how to best teach students and to learn the optimal pairing that will maximize learning. It is further asserted that making teachers aware that their evaluation of students is a reflection of these 3 variables will enable them to differentiate between their own biases and reactions and what the student's learning has actually been.—*Journal summary.*

4354. **Stenger, Charles A.** (Veterans Administration Central Office, Washington, D.C.) **A realistic appraisal of existing and future job opportunities for psychologists.** *American Psychologist*, 1970(Oct), Vol. 25(10), 959-961.—Explores the question of whether there is now an oversupply of doctoral level psychologists. Recent surveys about the supply of PhD psychologists, job openings in major employment settings, and the current employment status of recent doctoral graduates in all professions are discussed. For the field of psychology, only 1.1% were unemployed in 1969 and those were almost entirely noncitizens or psychologists not seeking employment. New psychologists, however, indicated a choice of only 2-4 positions in contrast to 5-8 offers a few yr. ago. While some reduction has occurred in the job market, virtually all psychologists are still finding positions in the type of work setting they desire. A shortage exists in the health services, where there are between 750 and 1000 vacancies. In addition, the 1970 Manpower Report of the President indicates a 75-100% increase in employer requirements for psychologists by 1980, the highest projected need of all professional groups except computer technologists. It is concluded that rather than an oversupply, a shortage exists, particularly in clinical and counseling psychology.—*Author abstract.*

4356. **Williams, Elliot W.** (Jacksonville State Hosp., Ill.) **From psychiatric aide to psychologist.** *Mental Hygiene*, 1970(Jul), Vol. 54(3), 430-432.—The process, problems, and rewards of changing roles from a career

aide supervisor to a professional clinical psychologist are presented autobiographically.—*A. M. Cawley.*

PSYCHOTHERAPY & ANALYSIS

4357. **Abramovitz, Carole M.** (U. Cape Town, South Africa) **Personalistic psychotherapy and the role of technical eclecticism.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 255-263.—Purports that realization of the uniqueness of the individual has not been given sufficient emphasis in psychotherapy. The plea is made for the personalistic styled psychotherapy developed by A. A. Lazarus within which empirically efficacious techniques derived from all orientations are utilized where individually applicable.—*Journal abstract.*

4358. **Blanck, Gertrude.** **Crossroads in the technique of psychotherapy.** *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 498-510.—Introduction of variations from classical technique, valid and necessary in the treatment of the disturbed patient, imposes responsibility upon the innovator to adhere to scientific discipline including familiarizing oneself with current theory and explaining in the language of the scientific community the reasons for and effect of the proposed new procedure. (28 ref.)—*Journal summary.*

4359. **Bosanquet, Camilla.** (Society of Analytical Psychology, London, England) **Getting in touch.** *Journal of Analytical Psychology*, 1970(Jan), Vol. 15(1), 42-58.—Touching and tactile communication is considered part of the analytic technique described. A brief account of early development and regression was recounted which showed the importance of responding to early nonverbal signals. Touching habits in our society and in the psychotherapeutic situation are reviewed and speculations are raised regarding the use of tactile communications in analysis. (21 ref.)—*Journal summary.*

4360. **Cohn, Ruth C.** **Psychoanalytic or experiential group psychotherapy: A false dichotomy.** *Psychoanalytic Review*, 1969, Vol. 56(3), 333-345.—Hypothesizes that all curative processes are fluid. All therapeutic interventions are effective if they lead to the integration of personally significant aspects of reality previously unavailable to the patient. Psychoanalytic insight leads to release of emotional and physical tension and experiential encounter promotes psychoanalytic insight. Differences relate to the role of the therapist and the emphasis on the present vs. the past. There is a historical trend beginning with Freud's conceptualization of transference and resistance and evolving toward more experiential attitudes in psychodynamically oriented individual and group psychotherapy.—*Journal summary.*

4361. **Collins, G. H.** (Stockport & Buxton Hosp. Group, Bramhall, England) **Intravenous chlorimipramine in the treatment of severe depression.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 211-212.—Results from 16 severely depressed female inpatients indicate that 81% of the patients showed good response to the drug. This compares favorably with the responses of similar groups to ECT. It is suggested that this form of treatment may be offered as an alternative and a preferred-by-patients form of therapy.—*R. L. Sulzer.*

4362. **Crampton, Martha.** (Sir George Williams U., Montreal, Quebec, Canada) **The use of mental imagery in psychosynthesis.** *Journal of Humanistic Psychology*, 1969(Fal), Vol. 9(2), 139-153.—Describes the use of mental imagery as 1 of a variety of methods

helpful in the therapeutic program of psychosynthesis, a form of therapy in which the coworkers involved are more appropriately identified as traveler-guide rather than patient-therapist. These techniques are useful in assessing the problems and potentialities of the patient and in creating a more vivid picture for him of the growth experiences he can expect in therapy. The combination of mental imagery techniques with other approaches (i.e., dream analysis, spontaneous drawings, expressive movement, sensory and body awareness, and role-playing) is discussed. It is concluded that such techniques are not only helpful in psychotherapy, but have broader implications for more people in education and preventive mental health. (24 ref.)—*P. McMillan*.

4363. Dan, Alice J., Burstein, Alvin G., & Naughton, John P. (U. Illinois, Medical Center) **Income and outcome.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 153-156.—B. F. Riess's (see PA, Vol. 41:13753) finding that patients involved in psychotherapy experience a greater increase in income than that expected on the basis of Department of Labor statistics is reexamined in the light of reports that men involved in exercise programs experience significant behavioral changes. The income change of 19 men involved in a physical exercise program with no psychotherapeutic intent was determined and found to be greater than that expected on the basis of Department of Labor statistics. The result is discussed in terms of the methodology of psychotherapy research, and the need for multiple-comparison groups, rather than simple "control" groups, in psychotherapy outcome studies is suggested.—*Journal abstract*.

4364. Fagan, Joen & Shepherd, Irma L. (Eds.) (Georgia State U., Atlanta) **Gestalt therapy now: Theory, techniques, applications.** Palo Alto, Calif.: Science & Behavior Books, 1970. viii, 328 p. \$9.95.—Contains chapters by 22 contributing authors including Frederick Perls, Laura Perls, and James Simkin, reporting on today's refined theory, perfected techniques, and expanded applications of Gestalt therapy.

4365. Garner, H. H. (Chicago Medical School, Ill.) **Brief psychotherapy and the confrontation approach.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 319-325.—Describes a psychotherapeutic method useful for the nonspecialist in psychotherapy, emphasizing the supportive rather than the "uncovering" approach. The technique involves a confrontation problem-solving orientation usable in brief (10-15 min.) sessions. The method uses "an authoritative statement directing the patient to control certain drives, impulses or desires" against which he has previously fought. He is then asked to tell the therapist what he thinks or feels about what he has been told. The statement may vary with the patient's personality, the nature of the current conflict, or the goals of therapy, and is intended to reveal to the patient his current problem, and how it relates to past, present, and expected experiences. The statement also indicates that it is up to the patient to solve the problem with the help of the therapist. It is felt that this confronting technique focuses attention on the patient's beliefs, fixed attitudes, and maladaptive processes.—*P. McMillan*.

4366. Gillis, John S. & Jessor, Richard. (Australian National U., Canberra, Australia) **Effects of brief psychotherapy on belief in internal control: An exploratory study.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 135-137.—Hypothesized

that successful psychotherapy will produce a lessened sense of alienation or "an increased belief in internal control." Psychiatric patients (13 receiving therapy, and 16 not) were administered a 35-item forced-choice inventory on internal-external control to measure the following areas of goal orientation: social recognition, love and affection, dominance, social-political, general life philosophy, occupation, and marriage and family. The therapy group was retested after 9-11 therapy sessions and the no-therapy group after a 10-wk period. Results show (a) scores for the therapy group indicating an increase in belief in internal control from pre- to posttests, and (b) that the therapy group was significantly higher in belief in internal control than the no-therapy group on posttests. It is suggested that "patients selected for therapy may tend to have greater belief in internal control" and thus be perceived by the staff as better therapy risks.—*P. McMillan*.

4367. Klein, George S. **The ego in psychoanalysis: A concept in search of identity.** *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 511-525.—There is little reason for satisfaction with ego psychology as a body of theory within psychoanalysis. There is no theory of nonsexual factors in motivation. Ego psychology has yet to articulate an active principle of development independent of the model of libidinal drive energy. Ego psychology is saddled with a foggy language of cathexis, neutralization, and discharge. E. H. Erikson's conception of mode-zone psychosexuality is preferable to the energetic conception. Psychoanalytic ego psychology offers a half-hearted and half-annotated commitment to explanation in terms of purpose on the one hand and to mechanism on the other. (24 ref.)—*D. Prager*.

4368. Lee, Stephen D. & Temerlin, Maurice K. (U. Oklahoma) **Social class, diagnosis, and prognosis for psychotherapy.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 181-185.—Presented a taped diagnostic interview with a professional actor who had been trained to portray a mentally healthy man to 40 psychiatric residents, assigned to 1 control and 3 experimental groups. Experimental Ss heard the interview after receiving 1 of 3 case histories of the man, constructed to simulate either upper, middle, or lower socioeconomic status. The controls made diagnoses without social history data. Results reveal a striking tendency for diagnosis to be influenced by social class. The experimental group which had heard the lower socioeconomic history "diagnosed the patient as mentally ill with fair prognosis, while controls diagnosed him as normal with an excellent prognosis." In Exp. II 95% of Ss told that the patient had been diagnosed neurotic or psychotic by board certified psychiatrists, diagnosed him as mentally ill. 9 out of 10 controls, given no prior data, diagnosed the patient as normal. Reasons for the influence of social class and prestige on diagnostic ratings are considered. (20 ref.)—*P. McMillan*.

4369. Lewinsohn, Peter M., Weinstein, Malcolm S., & Alper, Ted. (U. Oregon) **A behavioral approach to the group treatment of depressed persons: A methodological contribution.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 525-532.—Describes a quantitative method for the coding of interpersonal behavior using a learning theory framework. 4 males and 5 females participated in a 3-mo self-study group. All actions and reactions by each group member were tallied and entered on an interactional matrix. A quantitative

representation of a number of different aspects of social skill for each patient was obtained. Treatment techniques and the general course of treatment are discussed. Pre- and posttreatment comparisons were made. The method permitted Es to obtain base level information with which to define treatment goals and to measure behavior change and to focus the group on social interactional, here-and-now kinds of problems rather than hidden motives. It was also noted that information about each member's behavior was made available to the group and that the 3-mo time limit appeared to facilitate behavior change.—*E. J. Kronenberger.*

4370. **Mahrer, Alvin R.** (Miami U.) **Some known effects of psychotherapy and a reinterpretation.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 186-191.—Suggests a reexamination of psychotherapy research in which known effects reported in the literature are reinterpreted in 1 of 2 directions: (a) psychotherapy occurs when a person designated as a psychotherapist is working to help a patient, or (b) psychotherapy is a complex interaction between 2 or more persons, some of whom are therapists and some patients. It is felt that the "medico-psychiatric dimension of improvement-deterioration simply is not enough to scale the multidimensional effects of psychotherapy." Rather, it is suggested that "research utilize a broad array of dimensions consonant with behavior modification, experiential and existential approaches." Thus, many persons previously classified as unimproved or worsening "may be reunderstood as changing along dimensions better suited to contemporary approaches to psychotherapy." (44 ref.)—*P. McMillan.*

4371. **McConaghy, N.** (U. New South Wales, School of Psychiatry, Australia) **A controlled trial of imipramine, amphetamine, pad-and-bell conditioning and random awakening in the treatment of nocturnal enuresis.** *Medical Journal of Australia*, 1969(Aug), Vol. 2(5), 237-239.—In a controlled trial of 4 methods of treating nocturnal enuresis in 60 otherwise healthy 4½-15 yr. old children, pad-and-bell conditioning produced the best response, both initially and at follow-up 1 yr. later. Imipramine initially produced a significantly superior response, compared with placebo, but there was a considerable relapse rate with gradual withdrawal. Amphetamine proved of little value.—*Journal abstract.*

4372. **Mintz, Elizabeth E.** **Touch and the psychoanalytic tradition.** *Psychoanalytic Review*, 1969, Vol. 56(3), 365-376. The psychoanalytic taboo on touch is placed in its historical framework, is discussed in terms of its theoretical validity, and is surveyed in the light of some contemporary viewpoints. Finally the various meanings of physical contact between therapist and patient are discussed including an effort to establish some criteria as to when touch may be a valid therapeutic procedure. (16 ref.)—*D. Prager.*

4373. **Moss, C. Scott.** (U. Illinois) **Dreams, images, and fantasy: A semantic differential casebook.** Urbana, Ill.: U. Illinois Press, 1970. xiv, 302 p. \$8.50(cloth), \$3.95(paper).

4374. **Plaut, Alfred.** (Society of Analytical Psychology, London, England) **"What do you actually do?" Problems in communicating about analytical techniques.** *Journal of Analytical Psychology*, 1970(Jan), Vol. 15(1), 13-22.—In answering the question "What do you actually do?" the distinction was made between what is done at one time and not at another, and between what was thought to have been done and what was actually

done. The creation of the right emotional climate in the analytic situation must go on so that subjective interpersonal experiences may be expressed more objectively.—*P. Federman.*

4375. **Schapiro, Henri J.** (Yale U.) **Psychotherapy termination as a group experience with hospitalized psychiatric patients.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 155-160.—Describes a group method "to facilitate termination and reduce discharge problems" with patients who tend toward chronic hospitalization. Ss were 6 psychiatric patients (2 outpatients) in intensive therapy for 3-12 mo., who were very attached to their therapist. It was decided to (a) unite the patients and terminate therapy in a group setting, thereby replacing Ss' dependency on the therapist with the group; (b) ask for the help of the outpatients in reorienting the others to outside environments; and (c) ask for the help of Ss' families in reorientation. Results indicate that group participation did not reduce the patients' dependency on the therapist; outpatient help was only moderate; and family help, although resisted at 1st, was considerable in reorientation and ease of discharge.—*P. McMillan.*

4376. **Spiel, W.** **Die Therapie in der Kinder- und Jugendpsychiatrie.** [Therapy in child and adolescent psychiatry.] Stuttgart, W. Germany: Georg Thieme, 1967. 157 p.—A monograph, presenting the results of a study.—*I. D. London.*

4377. **Strean, Herbert S.** **Psychotherapy with children of psychotherapists.** *Psychoanalytic Review*, 1969, Vol. 56(3), 377-386.—Reviews 12 cases in which the parent-therapists were responsible, devoted, and loving, but were overpermissive and indulgent; they could not cope effectively with their children's aggression, blocked assertive expressions, and growth process. It is concluded that the availability of a therapist can help certain children of therapists master the difficult developmental hurdles of autonomy and assertiveness.—*D. Prager.*

4378. **Uëls, G.** **Krakh psikhooanaliza.** [The failure of psychoanalysis.] Moscow, USSR: Progress, 1968. 288 p.—Presents an account of the theoretical evolution of psychoanalysis, and the history of its spread and transformation in America.—*I. D. London.*

4379. **Von der Heydt, Vera.** (Society of Analytical Psychology, London, England) **The treatment of Catholic patients.** *Journal of Analytical Psychology*, 1970(Jan), Vol. 15(1), 72-80.—Treatment of Catholic patients was characterized by 2 aspects: elements of paranoia with regard to analysis and non-Catholic analysts, and a faith underlying superstitious beliefs. These tendencies should be understood and uncovered by the analyst and patient for the analysis to be effective and for treatment to proceed.—*Journal summary.*

4380. **Wentworth-Rohr, I.** **Symptoms, insight, and behavior techniques in psychoanalytic psychotherapy.** *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 47-59.—Behavior therapy as adjunctive to psychotherapy is useful in reducing postchildhood symptomatology provided the anxiety is also dissipated. Some clarification of symptom substitution is also achieved. The method did not result in symptom substitution; it reduced substitutional symptoms to more fundamental, complex personality disturbances and thereby enhanced and accelerated insight. (24 ref.)—*D. Prager.*

Therapeutic Process

4381. **Baum, O. Eugene.** (Woman's Medical Coll. of

Pennsylvania) **Countertransference.** *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 621-637.—Reviews the psychoanalytic literature on countertransference, and suggests that the restricted classical definition of countertransference is most useful in psychoanalysis. (25 ref.)—D. Prager.

4382. Butterfield, Gary. (Kansas State Coll., Ft. Hays) **Interjudge reliability for formal aspects of interviewee communication.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 311-316.—The reliability among 2 Master's level clinical psychologists and 2 Master's level psychiatric social workers in judgment of frequency and location of 8 types of speech disruptions, periodic judgments of speech rate, and location of change in speech rate was determined from interviewees' responses in 4 taped interviews. With the exception of the "ah" type of disruption, reliability estimates were quite low. The utility of clinical observation of these nonverbal behaviors was questioned when reported by clinicians not specifically and extensively trained for observation of these signs. A suggestion was made regarding the direction for development of training procedures.—*Journal abstract.*

4383. Dublin, James E. (U. Kentucky) **Reactions of A and B therapist "types" to verbal non-immediacy in neurotic and schizoid communications.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 392.

4384. Howard, Kenneth I., Orlinsky, David E., & Hill, James A. (Northwestern U.) **Patients' satisfactions in psychotherapy as a function of patient-therapist pairing.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 130-134. Describes a study involving 118 female patients (median age 26) and 18 male and 9 female staff therapists (median age 36) who reported on satisfactions gained from therapy in 5-66 sessions each on 4 variables: catharsis, mastery-insight, encouragement, or nothing. Results suggest that patients have rewarding experiences if the therapist (a) has a life situation which forms a complement to theirs, (b) maintains a personal detachment from the patient's problems, and (c) respects the patient's life status. It is also noted that therapists will be more effective with certain types of patients than with others (e.g., bachelor therapists did well with Ss who were independent women or young family women, but poorly with single girls). Results suggest a "promising start toward a more empirical rationale" for assigning patients to therapists.—P. McMillan.

4385. Janulis, Peter T. (Cornell U., Medical School) **The need for intervention: A variable in psychotherapy research.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 284-287.—Hypothesizes that "the degree to which a patient's valid needs for intervention are met by the therapist... has a positive correlation with therapeutic results," i.e., the rapidity with which the patient develops a positive working relationship and significant knowledge of himself. Although a patient's request for advice often represents a neurotic need to have the therapist take responsibility for a decision, it may also indicate a valid need for meaningful interpretations. Observation of the therapeutic process suggests that "the legitimate need for intervention is visible and measurable." The following components must be differentiated: (a) the patient's efforts to understand himself must not be confused with resistances and defenses; (b) justified requests for help must be met and not confused with neurotic demands; (c)

"legitimate need for an empathetic component in the therapist's response must be fulfilled and not frustrated"; and (d) the patient's neurotic needs, reaction, and fears must be accurately interpreted. Illustrations from 4 patient cases are presented. (16 ref.)—P. McMillan.

4386. Lambert, Kenneth. (Society of Analytical Psychology, London, England) **Some notes on the process of reconstruction.** *Journal of Analytical Psychology*, 1970(Jan), Vol. 15(1), 23-41.—The reconstruction process was found to be required when a patient's response to the present was unadaptive and disproportionate in affect; reconstruction is effective when it can demonstrate the interaction between the patient's early unconscious impulses and fantasies and the behavioral attitudes of the early personal environment; the analyst's reconstructive efforts promote therapy as he is able to demonstrate the nature and origins of the patients' maladaptive past and to open the possibility of new reactions to present situations in accordance with the patient's true self, neglect of reconstruction in transference analysis may leave the patient with states of guilt, confusion, and loss of bearings. (22 ref.)—*Journal summary.*

4387. Limentani, A. (5 Upper Wimpole St., London, England) **Una reevaluación del acting out en relación con la elaboración.** [A reevaluation of acting out in relation to elaboration.] *Revista de Psicoanálisis*, 1969(Oct), Vol. 26(4), 841-860.—Discusses the possibility that acting out, especially when it occurs in the course of repeated elaboration, accomplishes special functions for the patient and therapist which may be used to promote the analytic process. A critical revision of the literature on acting out is presented, examining the role of resistance and the relation between acting out and antisocial conduct. Acting out as a therapeutic guide is considered to be relative to the level of insight attained by the patient, as well as to the state of transference and countertransference. (26 ref.)—P. Hertzberg.

4388. Marcus, Ned N. **A psychotherapeutic corroboration of the meaning of the smiling response.** *Psychoanalytic Review*, 1969, Vol. 56(3), 387-401. By smiling appropriately the therapist is not only satisfying an instinctual wish on the part of the patient but also reasonably communicating himself and thereby strengthening the patient's ego. Patients suffering from very primitive pregenital fixations require face-to-face positioning of therapist and patient.

4389. Mitchell, Kevin M., Mitchell, Rosamond M., & Berenson, Bernard G. (U. Arkansas, Rehabilitation Research & Training Center) **Therapist focus on clients' significant others in psychotherapy.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 533-536.—Data were collected from 1st-interview psychotherapy tape recordings of 56 therapists. 2 independent therapist-raters classified 13 therapists as high facilitative and 43 therapists as low facilitative. Therapist focus on clients' significant others was also identified. The therapists differed significantly on the frequency of focus on clients' significant others both as a function of discipline and facilitative conditions. At least 50% of the therapists' focused responses did not include a specific personal referent.—E. J. Kronenberger.

4390. Moos, Rudolf H. & Macintosh, Shirley. (Stanford U., Medical School) **Multivariate study of the patient-therapist system: A replication and extension.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 298-307. Replicates and extends the work of R. H. Moos and S. R. Clemes (see PA, Vol.

41:7395) and F. van der Veen (see PA, Vol. 39:8090). Each of 6 patients saw each of 4 therapists twice. The variables—total activity, feeling words, action words, reinforcements—each was scored separately for patient and therapist for each interview. Patient problem expression and therapist accurate empathy were rated for each interview. Consistent differences between patients accounted for substantially more variance than consistent differences between therapists on all variables. Patient \times Therapist \times Session interactions generally accounted for large proportions of the total variance. Results indicate that the therapist behaviors studied were not the result of a trait, of a given tendency to be empathic, or of a consistently applied therapeutic technique, but rather were very substantially situationally or patient determined. (23 ref.)—*Journal abstract*.

4391. Rolla, Edgardo H. **La Interpretación y la construcción de modelos mentales.** [The interpretation and construction of mental models.] *Revista de Psicoanálisis*, 1969(Oct), Vol. 26(4), 753-764.—Discusses ideas on transference and the nature and function of interpretations. The psyche is examined in respect to mental models which are considered to be the bases of unconscious fantasy. A method called evocative interpretation is suggested to enable a patient to reconstruct unconscious fantasies with functional dissociation which alleviates guilt that could produce negation. Evocative interpretation is defined as a model for the resolution of condensations of the primary process, emphasizing the symbolic role of memory and the analyst's role of synthesis in the therapy.—P. Hertzberg.

4392. Seidman, Edward. (U. Kentucky) **Patient-therapist compatibility in a quasi-therapeutic situation.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 401.

4393. Sterba, Richard. (861 Whittier Blvd., Grosse Point, Mich.) **El destino del Yo en la terapia analítica.** [The role of the ego in analytic therapy.] *Revista de Psicoanálisis*, 1969(Oct), Vol. 26(4), 953-963.—Proposes that the ego accomplishes 3 functions in analysis. It (a) is the executory medium of the id and, therefore, crucial in transference; (b) must satisfy the demands of the superego; and (c) regulates the discharge of energy originating in the id in accordance with previous experience. The role of the ego in analysis is regarded as promoting therapeutic dissociation which broadens a patient's insight and enables him to express in words what he previously expressed in behavior.—P. Hertzberg.

4394. Truax, Charles B. (U. Calgary, Alberta, Canada) **Length of therapist response, accurate empathy and patient improvement.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 539-541.—Investigated "whether the average number of therapist words per unit of time is related to (a) his degree of accurate empathy and (b) to patient improvement during therapy." Each therapist's roster contained 3 attractive and 2 unattractive role-induction patients, and 2 attractive and 2 unattractive non-role-induction patients. Measurements for accurate empathy, patient outcome, and length of therapist statement were obtained. There was a moderate positive relationship between the average proportion of therapist talk and his level of accurate empathy and the 2 overall measures of patient improvement. It was noted that the higher the proportion of therapist talk, the more empathic the talk and the better the patient outcome.—E. J. Kronenberger.

4395. Truax, Charles B. (U. Calgary, Alberta, Canada) **Therapist's evaluative statements and patient outcome in psychotherapy.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 536-538.—Therapists were given a number of patients rated as good or poor therapy prospects. Measurements were made of the therapist's evaluation statements and patient outcome. Patients in therapy with psychiatrists making fewer evaluative statements tended to show greater improvement than patients in psychotherapy with therapists making relatively more frequent evaluative statements. The data suggested that high evaluative statements by therapists impeded patient progress and lowered the effectiveness of psychotherapy.—E. J. Kronenberger.

4396. Wogan, Michael. (U. Connecticut, Div. of Health Service) **Effect of therapist-patient personality variables on therapeutic outcome.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 356-361.—Attempted to assess the effect of therapist and patient personality variables on the outcome of therapy. 55 women and 27 male psychiatric inpatients served as Ss. The MMPI was used to derive personality measures. Therapist and patient ratings of the therapy relationship served as the dependent variables. Therapy outcomes were found to be positively related to therapist's level of anxiety and negatively related to therapist's level of repressiveness. Patients' levels of anxiety and repressiveness were both positively related to outcomes. In 2 instances, increasing similarity between patient and therapist was found to be negatively related to outcome. (15 ref.)—*Journal abstract*.

Group Therapy

4397. Abrams, Laurence. (Baylor U., Medical School) **Action group training techniques.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 151-154.—Suggests that student therapist's initial experience in group psychotherapy be with psychodrama groups in which experienced staff members are present. More conventional groups and individual therapy will be less anxiety-provoking.—A. Krichev.

4398. Amaro, Jorge W. & Soeiro, Alfredo C. (U. São Paulo, Brazil) **Psychodrama at a psychiatric clinic.** *Group Psychotherapy*, 1969, Vol. 22(3-4), 157-163.—Reviews the history of psychodrama in South America and in São Paulo, and discusses the experiences of psychiatrists and psychologists who undertook psychodrama training in that city.—A. Krichev.

4399. Bartoletti, Mario D. (Child & Family Psychiatric Clinic, Toronto, Ontario, Canada) **Conjoint family therapy with clinic team in a shopping plaza.** *Group Psychotherapy*, 1969, Vol. 22(3-4), 203-211.—Describes the week-by-week program of 1 clinic's structured attempts to provide a maximum amount of service within an orientation of brief conjoint therapy with the whole family as well as full assessment of the child. The basic philosophic premise is that "effective therapy consists of meaningful shared experiences for both the family members and the clinic team members."—A. Krichev.

4400. Bustos, Dalmiro M. (Inst. de Psicoterapia, La Plata, Argentina) **Moreno Academy, world center of psychodrama at Beacon, N.Y., as seen by an Argentinian.** *Group Psychotherapy*, 1969, Vol. 22(3-4), 155-156.—Presents a brief description of the Academy and 1 professional's experiences there.—A. Krichev.

4401. Di Loreto, Adolph O. (Michigan State U.) **A comparison of the relative effectiveness of systematic desensitization, rational-emotive and client-centered group psychotherapy in the reduction of interpersonal anxiety in introverts and extroverts.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5230-5231.
4402. Fantel, E. (Brentwood Hosp., Los Angeles, Calif.) **Psychodrama in Army and Veterans Administration Hospitals: Summary.** *Group Psychotherapy*, 1969, Vol. 22(3-4), 189-190.—Presents a brief summary of the author's experiences in beginning programs in psychodrama in the Army during and after World War II.—A. Krichev.
4403. Haskell, Martin R. (Long Beach State Coll.) **Techniques of group psychotherapy.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 100-105.—Demonstrates that a typology based on interpersonal maturity level is effective in separating delinquent boys into meaningful categories. It is suggested that typologies based on various sociogrammatic techniques would be more meaningful than the currently used mental illness categories.—A. Krichev.
4404. Haven, George A. & Wood, B. S. (Veterans Administration Hosp., Waco, Tex.) **The effectiveness of eclectic group psychotherapy in reducing recidivism in hospitalized patients.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 153-154.—Hypothesized that recidivism for 34 20-58 yr. old hospitalized veterans (experimental group) exposed to group psychotherapy twice/wk would be significantly lower than for 34 controls not given psychotherapy. After discharge from the hospital, all Ss were followed for 1 yr. to determine whether they were readmitted with the same diagnosis, to any hospital in the area. Results from 3 tests given 12 mo. later did not reveal significant differences between the 2 groups in either patients discharged and readmitted, or those discharged and not readmitted compared to those never discharged. A 4th test, however, did show that of 21 experimental group members who carried a diagnosis of anxiety reaction, 17 were discharged and not readmitted as compared to the control group where only 4 of 12 Ss with a similar diagnosis were discharged and not readmitted.—P. McMillan.
4405. Höck, K. **Gruppenpsychotherapie in Klinik und Praxis.** [Group therapy in the clinic and in practice.] Jena, E. Germany: Gustav Fischer, 1967. 224 p.—Reproduces papers read at the International Symposium on Group Therapy, held in Berlin in 1966.—I. D. London.
4406. Johnsgard, Keith W. & Schumacher, Ray M. (San Jose State Coll., Counseling Center) **The experience of intimacy in group psychotherapy with male homosexuals.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 173-176.—Reports results of extended group psychotherapy (3 yr.) with male homosexuals in a college population, who were actively homosexual and voluntarily seeking treatment. The goal of the group did not involve changing Ss' sexual orientation from homosexual to heterosexual. Therapy initially showed Ss to have difficulty in close emotional relationships, but as time progressed, group members were able to direct more positive and negative feelings toward each other. It is suggested that in such cases "growth occurs in a therapeutic environment where more than 1 therapist is involved and where emphasis is placed on increased therapist and client transparency in immediate emotional confrontation." It was found that success in treatment required long-term therapy and, if possible, continuity of treatment. It is noted that a long break in treatment, as in summer vacation, could be destructive to the group.—P. McMillan.
4407. Karp, Marcia. (Moreno Inst., Beacon, N.Y.) **Directorial catharsis: Fact or fancy.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 137-139.—In psychodrama, a spotlight could be focused on the progressive liberation of the director from catalyst to a fusing and cohesing person. The need for liberation should not be denied by the director.—A. Krichev.
4408. Moreno, J. L. (Moreno Inst., Beacon, N.Y.) **Address of the Honorary President of the Fourth International Congress of Group Psychotherapy.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 95-99.—Presents brief recollections of the author's early experiences, centering around the development of the sociogram and its meanings.—A. Krichev.
4409. Moreno, Zerka T. (Moreno Inst., Beacon, N.Y.) **Practical aspects of psychodrama.** *Group Psychotherapy*, 1969, Vol. 22(3-4), 213-219.—Presents 5 rules by which the director of a psychodrama session can better enhance the interaction which results. Each rule is accompanied by a case example.—A. Krichev.
4410. Moreno, Zerka T. (Moreno Inst., Beacon, N.Y.) **Psychodrama on closed and open circuit television.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 106-109.—Presents a case study which illustrates the use of psychodrama on TV as a training device and a therapeutic aid.—A. Krichev.
4411. Robbins, Ronald H. (Astor Home for Children, Rhinebeck, N.Y.) **The re-acting barrier in psychodrama settings.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 140-143.—Describes, with case examples, the use of human barriers which react to the changes in portrayal during a role-playing session. Each person in the barrier represents a block in the actor's life; the actor must work out a solution to the block before the barrier allows the actor to break out of the trap.—A. Krichev.
4412. Robinson, Margot & Jacobs, Alfred. (Associated Psychological Consultants, Los Angeles, Calif.) **Focused video-tape feedback and behavior change in group psychotherapy.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 169-172.—Studied the comparative effectiveness of videotape feedback and therapist-led discussions among Ss participating in group therapy. 40 20-49 yr. old hospitalized patients comprised 6 groups of 6 or 7 Ss each, meeting 6 times in 2 wk. for 1-hr videotaped therapy sessions with 2 therapists. Experimental Ss received videotape feedback; controls received an equivalent length therapist-led discussion group only. Results indicate that experimental Ss showed more adaptive change as rated by external judges. However, subjective estimates of adaptive change were almost identical between the 2 groups.—P. McMillan.
4413. Rojas-Bermudez, Jaime G. (Asociacion Argentina de Psicodrama y Psicoterapia de Grupo, Buenos Aires) **The "intermediary object."** *Group Psychotherapy*, 1969, Vol. 22(3-4), 149-154.—Presents a clarification of the meaning of the term in light of its historical application to an experiment in which puppets were used to aid in the psychodramatic treatment of chronic psychotics. 6 case histories are included to illustrate the properties necessary to an object for it to be suitable for this purpose.—A. Krichev.

4414. Sturm, Israel E. (Veterans Administration Hosp., Northport, N.Y.) **Note on psychodrama in a "helping relationship."** *Group Psychotherapy*, 1969, Vol. 22(3-4), 191-193.—Psychodrama is considered as a method array viewed as potentially enhancing to any helpful relationship. The components of such a relationship are described as expression, feedback and information, instruction, and practice. The relationship between psychodrama and sensitivity training are briefly discussed.—A. Krichev.

4415. Verinis, J. Scott. (Mt. Sinai Hosp., Chicago, Ill.) **The ex-patient as a lay therapist: Attitudes of group members toward him.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 161-163.—Describes results of a questionnaire given to 15 patients attending group therapy sessions at a state research hospital to ascertain their attitudes toward other members of the group who were staff therapists, lay therapists (i.e., expatients), and other out- and inpatients. Lay therapists were rated almost as highly as staff therapists on questions concerning helpfulness to Ss or others. Reasons for the favorable ratings are discussed. It is concluded that the lay therapist can provide inspiration, closeness, and a model of appropriate behavior more effectively than the professional therapist who can supply insight and advice.—P. McMillan.

4416. Vernallis, Francis F., Shipper, John C., Butler, Donald C., & Tomlinson, T. M. (Olive View Hosp., Calif.) **Saturation group psychotherapy in a weekend clinic: An outcome study.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 144-152.—Hypothesized that significant differences would occur in favor of patients in saturation group therapy (SGT) when compared with controls on specified measures including: (a) MMPI-Depression scale, (b) Rotter's Incomplete Sentences Blank, (c) Report of Social Adjustment, and (d) Symptom Rating scale, Factor E (motivation). Ss were 46 18-59 yr. old, male psychiatric patients. Results reveal firm psychometric evidence of the effectiveness of the treatment. Evidence supports the interpretation "that SGT resulted in the saturation of the comparison outcome measures in a positive and unequivocal manner. 3 of the 4 prediction measures were significant at posttreatment and all 4 at follow-up. . . . A large number of unpredicted measures were also statistically significant." Reservations are expressed concerning measurement. The research potential of SGT is stressed. (15 ref.)—P. McMillan.

4417. Weiner, Hannah B. (New York Medical Coll.) **J. L. Moreno: Mr. group psychotherapy.** *Group Psychotherapy*, 1968, Vol. 21(2-3), 144-150.—Discusses the mystique and abilities of Moreno who is acknowledged as a dedicated individual who has pioneered in many group psychotherapy techniques, including psychodrama, sociometry, and role-playing.—A. Krichev.

Behavior & Conditioning Therapy

4418. Edelman, Robert I. (Virginia Polytechnic Inst.) **Effects of progressive relaxation on autonomic processes.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 421-425.—2 studies were performed to examine the assumption that the therapeutic technique of desensitization is a behavioral phenomenon of anxiety highly correlated with autonomic processes. In Exp. I, 40 male undergraduates were exposed to various progressive relaxation stimuli, and measurements of autonomic

activity occurred at predetermined breaks. Results did not support the contention that progressive relaxation altered autonomic processes. In Exp. II, high- and low-anxious Ss (40 male undergraduates) were used. Progressive relaxation did not exert differential effects on the 2 groups and it was noted that the results cast doubt on contentions that progressive relaxation exerts any unique effect upon autonomic function. (18 ref.)—E. J. Kronenberger.

4419. Kamil, Leonard J. (New York U.) **Psychodynamic changes through systematic desensitization.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 199-205.—Attempted to integrate psychoanalytic theory and the data from behavior therapy, specifically systematic desensitization. It was found that snake phobics could be significantly discriminated from a group of normals on a measure of castration anxiety. Following systematic desensitization of the fear of harmless snakes, (a) 10 treated snake phobics were significantly lower on manifest anxiety than 10 non-treated snake phobics, but not as low as 10 normals; (b) treated snake phobics were significantly lower than non-treated snake phobics on a TAT measure of castration anxiety, but not as low as normals; and (c) treated snake phobics were not significantly lower than non-treated snake phobics on a Rorschach measure of castration anxiety, and both were significantly higher than normals. (20 ref.)—*Journal abstract*.

4420. Lauth, Henry. (Queen Elizabeth Hosp., Birmingham, England) **Video-tape recording as an aid to behaviour therapy.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 207-208.—Describes the case of a 40-yr-old man with severe phobic and obsessive-compulsive symptoms of many years duration. He was successfully treated with systematic desensitization, first in imagination and later in real-life situations. In this instance, closed-circuit TV proved to be a useful and essential adjunct to successful treatment.—*Journal summary*.

4421. Leckerman, Laurence & Lynch, Denis J. (Eastern State School & Hosp., Trevese, Pa.) **The effects of model reinforcement on emotionally disturbed adolescent boys.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 545-547.—32 adolescent boys were divided into a punishment group, a positive reinforcement or reward group, and a control group. All Ss observed a model who performed a predetermined and rehearsed sequence of behavior. Os rated the Ss behavior. In general the study did not show gross behavior model effects. The behavior of the model was seen as influencing the behavior of the Ss in the positive reinforcement group. There was a disinhibitory effect on response latency which suggested the importance of more subtle modeling effects than had been previously considered.—E. J. Kronenberger.

4422. McFall, Richard M. & Marston, Albert R. (U. Wisconsin) **An experimental investigation of behavior rehearsal in assertive training.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 295-303.—Developed a standardized, semiautomated, behavior rehearsal treatment procedure, and compared 2 variations of this procedure, 1 with performance feedback and 1 without, with 2 control procedures, a placebo therapy, and a no-treatment condition, in training 42 undergraduates to be more assertive. Behavioral, self-report, and psychophysiological laboratory measures, as an unobtrusive in vivo assertive test, revealed that the 2 behavior

rehearsal procedures resulted in significantly greater improvements in assertive performance than did the control conditions. There was a nonsignificant tendency for behavior rehearsal coupled with performance feedback to show the strongest treatment effects. (19 ref.)—*Journal abstract*.

4423. Milby, Jesse B. (U. Alabama, Medical Center, Birmingham) **Modification of extreme social isolation by contingent social reinforcement.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 149-152.—2 socially isolated male patients, a 37 yr. old and a 38 yr. old, were placed on a program where social reinforcement from staff members was made dependent on social interaction with other patients or staff members. This procedure was imposed in a setting where only limited control was possible. The level of social interaction and a concomitant alternate behavior in each S was increased when the contingency for social reinforcement was imposed. Another example of the efficacy of social reinforcement where there is little control over other reinforcers is provided. Implications for use of similar procedures to increase generalization in the community are discussed.—*Journal abstract*.

4424. Parrino, John J. (Louisiana State U.) **The effect of pre-therapy information on learning in psychotherapy.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 400.

4425. Sabatasso, Anthony P. & Jacobson, Leonard I. (U. Miami) **Use of behavioral therapy in the reinstatement of verbal behavior in a mute psychotic with chronic brain syndrome: A case study.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 322-324.—Employed a behavioral therapy program in order to reinstate verbal behavior in a 58-yr-old psychotic with chronic brain syndrome who had been mute for 5 yr. The program proceeded from the control of simple, non-verbal behaviors to the control of simple, verbal behaviors. The methods employed were those of reinforcement, behavior shaping, and modeling. Completion of the program resulted in the partial reinstatement of verbal behavior. Within 10 hr. of therapy, S verbalized 307 words, 56 different words, and several simple sentences. The verbal behavior reinstated in the therapeutic situation generalized to behavior on the ward. The S began to respond verbally, but not always appropriately, to individuals on the ward who spoke to him. The reinstated verbal behavior had not extinguished 1 yr. later. Results suggest the possibility of developing comprehensive language programs for use with mute psychotics of varying diagnostic categories.—*Journal abstract*.

Special & Adjunctive Therapy

4426. (Rollman Psychiatric Inst., Cincinnati, O.) **Indoklon: Convulsive therapy: Experimental-clinical studies.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 358-360.—Presents pharmacological and clinical information on indoklon (flurothyl), a fluorinated ether, used as an alternative convulsive therapy method for ECT. A table is included summarizing different clinical studies of animals and humans reported since 1958. Results of these studies suggest favorable outcomes in 384 patients and poor results in 20. Advantages of indoklon over ECT include less apprehension by patients, reduced post-therapy confusion, and removal of the bad connotation associated with ECT. Indoklon is administered by

inhalation; iv administration has not yet been accepted.—P. McMillan.

4427. Beuret, Lawrence & Swanson, David W. (Loyola U., Stritch School of Medicine, Hines, Ill.) **Endocrine effects of electroconvulsive therapy: A review.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 650-661.—ECS stimulates the pituitary as shown by an increase in anterior and posterior lobe function. Other endocrine changes with ECS are not significant. "It is possible that the ECS alters the set point affecting all the hypothalamic functions, of which the pituitary hormone response is the only 1 that can be measured objectively at this time." (56 ref.)—D. Prager.

4428. Denny, James M. & Fagen, Ann C. (U. Hawaii) **Group art therapy with university students: A comparative case analysis.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 164-168.—Uses a detailed analysis of the art productions and interpersonal behavior of 2 members of a 5-person art therapy group to illustrate the use of group art therapy instituted at a university counseling and testing center. Tasks presented to Ss included approaches, i.e.: (a) exploratory and rapport-building (automatic or free-drawing techniques), (b) exploration of inner feelings, (c) interpersonal relations and awareness of external world (projective-type drawing tasks), (d) expressions concerning the group, and (e) supplementary approaches (painting to music, constructing collages, etc.). Illustrations of 8 paintings and clay figures produced by the 2 Ss are included and discussed.—P. McMillan.

4429. Gross, William F., Curtin, Mary E., & Moore, Kenneth B. (Veterans Administration Hosp., Lexington, Ky.) **Appraisal of a milieu therapy environment by treatment team and patients.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 541-545.—The Barrett-Lennard Relationship Inventory, modified for use with staff and patients, was administered to a staff group of 13 and a patient group of 31. The therapeutic climate was judged as favorable by both groups but more favorable by the staff than by patients. Dimensional descriptions were presented. The underlying dimensionality of the 4 therapy variables differed both quantitatively and qualitatively for staff and patients. Unconditional regard appeared to make a separate contribution.—E. J. Kronenberger.

4430. Kossoris, Penny. (El Camino Hosp., Mountain View, Calif.) **Family therapy: An adjunct to hemodialysis and transplantation.** *American Journal of Nursing*, 1970(Aug), Vol. 70(8), 1730-1733.—The treatment of choice for the renal patient is working with the patient within his family setting. What affects 1 member of a family affects all, especially when 1 family member's life depends on a hemodialysis machine or a kidney transplant. Concepts of family care are used to help families cope with the stresses and strains of altered financial, social, and psychological circumstances. These concepts are reviewed and interpreted with illustrations from families with renal patients.—B. A. Burkard.

4431. López-Ibor Aliño, Francisco. **Terapéutica de "reactivación."** [Reactivation therapy.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Apr), Vol. 28(2), 117-125.—Describes the aims and methods of a therapeutic technique which seeks to rehabilitate through social integration and constructive activity, approximating the atmosphere of everyday living before hospitalization. Patients were encouraged to pursue their previous vocations and interests, maintaining as much

contact as their illness allowed. Activities included music, art, crafts, sports, games, lectures, concerts, and a library. In the reactivation process, Ss were observed to have an initiation period, followed by rapid activation in some occupation suited to each S's individual needs. The reactivation of (a) a 50-yr-old man with schizophrenia and chronic alcoholism, and of (b) a 53-yr-old man with endogenous depression is described to illustrate 2 different, but successful, techniques.—P. Hertzberg.

4432. Marks, Isaac; Gelder, Michael, & Bancroft, John. (Inst. of Psychiatry, London, England) **Sexual deviants two years after electric aversion.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 173-185.—24 patients comprised of 12 transvestites and fetishists, 7 transsexuals, and 5 sadomasochists given 2-3 wk. of electric aversion showed improvement except for the transsexuals. Improvement was not related to the amount of treatment with early evidence of improvement shown by those achieving the greatest change in incidence of deviant acts and fantasies or in deviant concepts. Untreated deviants showed less change during the 14-mo follow-up. These findings indicate that despite its unpleasant nature aversion therapy may be of value in the treatment of sexual deviations other than transsexual feelings. (19 ref.)—R. L. Sulzer.

4433. Zifferblatt, Steven M. (U. Nebraska) **Prerequisites to the implementation of a behaviorally-based program in occupational therapy.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 430.

Drug Therapy

4434. Adamson, John D. (U. Manitoba, Winnipeg, Canada) **"Mandrax" as an hypnotic for psychiatric in-patients: A comparative trial with chloral hydrate.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 209-210.—In a double-blind crossover study, sleep induction by mandrax was evaluated with 63 patients, mainly psychotics. Mandrax proved to be effective and may be particularly recommended for older patients because of reduced incidence of minor side effects.—R. L. Sulzer.

4435. Baro, Franz; Brugmans, Jo; Dom, Rene, & Van Lommel, Renaat. (U. Louvain, Belgium) **Maintenance therapy of chronic psychotic patients with a weekly oral dose of R 16 341: A controlled double-blind study.** *Journal of Clinical Pharmacology & the Journal of New Drugs*, 1970(Sep), Vol. 10(5), 330-341.—R 16 341 is a diphenylbutylpiperidine derivative related to pimozide and fluspirilene. Tests were conducted with 38 hospitalized male chronic psychotic patients. The drug proved effective as a neuroleptic agent with no reduction in extrapyramidal symptoms over previous drugs. The advantage of R 16 341 (penfluridol) over other drugs lies in its long-lasting effects (weekly oral administration). Blood analysis showed no toxicity.—E. M. Uprichard.

4436. Bloch, H. Spencer. (Children's Hosp. Medical Center, Boston, Mass.) **Brief sleep treatment with chlorpromazine.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 346-355.—Treatment of 114 Ss with 24-48 hr. of sleep induced by chlorpromazine was an effective therapeutic-diagnostic-management tool for severely behaviorally disturbed and uncontrolled patients in an open, crisis-oriented milieu ward in Vietnam where no other facilities for managing such patients existed. A description of the technique and discussion of its results are presented. (29 ref.)—D. Prager.

4437. Coons, W. H. & Annis, Helen. (York U., Toronto, Ontario, Canada) **Worthington and perceptual defensiveness.** *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 333-335.—Responds to A. G. Worthington's (see PA, Vol. 45:Issue 3) criticism of an earlier study by W. H. Coons and H. Annis (see PA, Vol. 44:12759) concerning tranquilizers and perceptual defensiveness. Methodological and statistical procedures at issue are clarified and explained. It is concluded that results obtained in the original study are still applicable, although it is acknowledged that issues raised by Worthington about distinguishing between perceptual and response processes are important ones.—P. McMillan.

4438. Curry, Stephen H. (National Inst. of Health, Bethesda, Md.) **The determination and possible significance of plasma levels of chlorpromazine in psychiatric patients.** *Agressologie*, 1968, Vol. 9(1), 115-121.—Determined plasma levels of chlorpromazine and some of its relatively nonpolar metabolites in patients undergoing chlorpromazine treatment by means of gas chromatography with an electron capture detector. Wide variation was observed (a) in the levels at various times after drug administration, (b) in various patients on similar doses, and (c) $1/2$ -lives of elimination. Ss with levels of chlorpromazine around 100-200 ng/ml responded better with the drug than Ss on lower levels. It is suggested that the optimum dosage regimen should be based on the intake of the amount of chlorpromazine necessary to maintain a therapeutic level of the drug in plasma.—M. Daniels.

4439. Davies, Brian. (U. Melbourne, Victoria, Australia) **Recent studies of severe depressive illnesses: II.** *Medical Journal of Australia*, 1969(Mar), Vol. 1(11), 557-565.—Reviews clinical observations on various drugs for their effects on severe depression, with emphasis on amphetamine, lithium, reserpine, iproniazid, and imipramine. Pharmacological clues to the biological basis of mood disorders are described. Studies are presented of the metabolism of brain monoamines, noradrenaline and serotonin, and of body fluids and enzyme systems. The catecholamine and monoamine hypotheses concerning depression are compared in light of recent findings. It is felt that the monoamine hypothesis that "antidepressant treatments produce improvement by altering monoamine metabolism in certain parts of the brain" better defines depression than the catecholamine hypothesis. It is suggested that since these metabolic studies have involved only severely ill patients, their relevance to mild depressive illnesses is not yet clear. (122 ref.)—P. McMillan.

4440. De Smedt, Raoul; Rodrigus, Etienne; Debandt, Robert, & Brugmans, Jo. (Mental Hospital of the Brothers of Charity, Antwerp, Belgium) **Dexbenzetimide in neuroleptic induced Parkinsonism: A double-blind crossover study with a 16-week follow-up.** *Journal of Clinical Pharmacology & the Journal of New Drugs*, 1970(May), Vol. 10(3), 207-211.—Assessed the therapeutical efficacy, dosage, and safety of dexbenzetimide (D) using 17 male psychiatric patients, 31-64 yr. old, with a mean age of 45. All Ss were on chronic maintenance therapy with 1 or more neuroleptics. Blood analyses were conducted before and after a 16-wk open trial period. The treatment period ranged from 10-35 days with D and from 6-30 days with placebo. It was found that D in doses of .75-1.5 mg/day is "an active and safe antiparkinsonian agent and that a

single dose is effective for at least 24 hr." It seemed to be similar to known antiparkinsonian agents in controlling neuroleptic-induced extrapyramidal side effects. D was further characterized by a beneficial effect on mood.—P. Hertzberg.

4441. Faillace, Louis A., Voulekis, Alkinoos, & Szara, Stephen. (Johns Hopkins U., Medical School) **Hallucinogenic drugs in the treatment of alcoholism: A 2-year follow-up.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 51-56.—12 chronic alcoholic patients who were treated with hallucinogenic drugs were evaluated 2 yr. after drug treatment. 3 were relatively stable, 8 were hospitalized or drinking at the time of follow-up, and 1 was lost to follow-up. Of the 3 improved, only 2 could be considered to have benefited from the drug. From these data, the use of hallucinogenic drugs in the treatment of alcoholism appears to be of limited value. (17 ref.)—*Journal summary.*

4442. Fine, E. W., Lewis, D., Villa-Landa, L., & Blakemore, C. B. (West Philadelphia Community Mental Health Consortium, Pa.) **The effect of cyclandelate on mental function in patients with arteriosclerotic brain disease.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 157-161.—Describes a double-blind crossover trial in which the effect of cyclandelate was assessed on 40 patients severely handicapped with arteriosclerotic brain disease. Important mental functions improved, suggesting that enhancing cerebral circulation produces a positive clinical response on these patients.—R. L. Sulzer.

4443. Goddard, P. & Lokare, V. G. (St. James' Hosp., Portsmouth, England) **Diazepam in the management of epilepsy.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 213-214.—16 hospitalized epileptics (age range = 25-82 yr.) were improved in control of fits and some aspects of personality functioning.—R. L. Sulzer.

4444. Goldstein, Burton J. & Weiner, Donald M. (U. Miami, Medical School) **Comparative evaluation of benzocetamine and diazepam in treatment of anxiety.** *Journal of Clinical Pharmacology & the Journal of New Drugs*, 1970(May), Vol. 10(3), 194-198.—Presents a follow-up study in which 32 male and 28 female adults with target symptoms of anxiety and depression received a daily dose of either 30-80 mg. of benzocetamine (Ba-30803) or 6-20 mg. of diazepam in a double-blind fashion. Ss were volunteers and 51 completed 28 days of treatment. Of these, 25 received benzocetamine and 26 diazepam. Judgments of each S's degree of improvement were made at the end of the treatment period by a psychiatrist and by each S. Scores were assigned to each symptom and rated before and after treatment. "Good to excellent results were considered to have been achieved in 23 of 28 Ss receiving benzocetamine and in 21 of 27 receiving diazepam." There was no significant difference in improvement between the 2 treatment groups. A total of 15 and 14 side effects related to the sedative effects of each drug were reported for benzocetamine and diazepam, respectively.—P. Hertzberg.

4445. Grant, Frederick W. (Marcy State Hosp., N.Y.) **Dynamic aspect of chlorpromazine metabolism.** *Agressologie*, 1968, Vol. 9(1), 123-126.—Chromatographic and colorimetric analyses of the nonpolar fraction of urinary chlorpromazine metabolites show reproducible changes in the relative proportion of methylated metabolites brought about by normal and contrived anxiety-stress situations. These include patient response to visitors, clinical test procedures, ECS

therapy, intramuscular administration, ancillary medication. Correlation with symptom exacerbation and remission is noted. The effect of dosage changes suggests a means of determining the optimum therapeutic dosage for repression or exaggeration of mood changes.—M. Daniels.

4446. Heninger, George R. & Mueller, Peter S. (Connecticut Mental Health Center, New Haven) **Carbohydrate metabolism in mania: Before and after lithium carbonate treatment.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 310-319.—Studied the iv glucose tolerance test (GTT) and insulin tolerance test (ITT), with concomitant assessment of serum insulin and growth hormone (HGH), in 13 manic patients before and after at least 2 wk. of lithium carbonate treatment. Results indicate that when compared to the lithium-carbonate-treatment phase that (a) in the GTT, the rate of glucose utilization tended to be higher and insulin values significantly lower in the manic phase; (b) in the ITT there was a more rapid and prolonged hypoglycemia following insulin in the manic phase; and (c) both tests indicate a relatively increased sensitivity to insulin in mania. Reduction of insulin sensitivity when on lithium carbonate treatment was most evident in Ss with the greatest clinical change in manic symptoms. Increased insulin sensitivity was significantly correlated to ratings of manic symptoms before lithium carbonate treatment, and improvement in manic symptoms correlated significantly with the development of relative insulin resistance during lithium carbonate treatment. Changes in insulin sensitivity could not be related to duration of lithium carbonate treatment, to serum lithium levels, or to changes in HGH. It is concluded that the relatively increased insulin sensitivity observed in mania is a correlate of the clinical state and is not directly affected by lithium carbonate treatment per se. The insulin sensitivity of mania is compared to the insulin resistance of depression, and some of the clinical and metabolic aspects of mania and depression that might relate to insulin sensitivity are discussed. (49 ref.)—*Journal summary.*

4447. Howard, J. Campbell. (St. Barnabas Hosp., New York, N.Y.) **Psychotropic agents in the coronary patient: What and when.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 335-338.—Presents indications for certain psychoactive drugs in various stages of coronary artery disease. Tables are presented showing suggested dosages, types of disorder, and drug names for sedatives, major and minor tranquilizers, and antidepressants. The need for a good patient-physician relationship is stressed because of the many emotional concomitants of heart disease.—P. McMillan.

4448. Johnson, G., Friedhoff, A. J., Alpert, M., & Marchitello, J. (Schering Corp., Bloomfield, N.J.) **Effects of N-acetyl dimethoxyphenethylamine (NADMPEA) in man.** *Psychopharmacologia*, 1970, Vol. 17(5), 434-438.—Evaluated the effects of N-acetyl dimethoxyphenethylamine in 2 patients with schizophrenic reaction and 2 nonschizophrenic drug abusers in a modified rising dose tolerance test. Doses ranged from 1.3-16.4 mg/kg without any hallucinogenic effect. A pharmacological effect and drug-induced tremor was seen at higher doses.—*Journal abstract.*

4449. Kales, Anthony; Allen, Clyde; Scharf, Martin B., & Kales, Joyce D. (U. California, Medical School, Los Angeles) **Hypnotic drugs and their effectiveness: All-night EEG studies of insomniac subjects.** *Ar-*

chives of General Psychiatry; 1970(Sep), Vol. 23(3), 226-232.—Evaluated 3 drugs, chloral hydrate (1000 mg.), flurazepam (30 mg.), and glutethimide (500 mg.), in the sleep laboratory with 8 healthy insomniac Ss to determine their effectiveness in inducing and maintaining sleep. A schedule of 22 consecutive nights was used in each separate drug evaluation: 4 placebo nights, followed by 2 wk. of drug administration, followed by 4 placebo nights for evaluating withdrawal changes. Flurazepam (30 mg.) was effective both in inducing and maintaining sleep over the entire 2-wk drug administration period. Chloral hydrate (1000 mg.) and glutethimide (500 mg.) significantly decreased sleep latency on the 1st set of 3 laboratory drug nights, but this effectiveness appeared to diminish rapidly. Chloral hydrate and flurazepam produced only minimal changes in REM sleep. Glutethimide produced a marked REM suppression which persisted throughout the 2 wk. of drug administration. Following withdrawal, there was a marked REM rebound. Flurazepam administration resulted in a gradual progressive decrease in Stage-4 sleep which was maintained through the withdrawal nights. It is concluded that the sleep laboratory allows an accurate determination of a drug's effectiveness in inducing maintaining sleep, the duration of its effectiveness, and the type of sleep induced. This contrasts with traditional studies evaluating drug effectiveness where precise measurements of sleep or waking cannot be made.—*Journal summary*.

4450. Kellner, Robert. (U. New Mexico, Medical School) **A controlled trial of benzocetamine (Ba-30803) in neurotic anxiety.** *Journal of Clinical Pharmacology & the Journal of New Drugs*, 1970(Sep), Vol. 10(5), 342-348.—Benzocetamine (Ba-30803) is chemically 1-methylaminomethyl-dibenzo-[b,e]bicyclo[2.2.2]octadiene hydrochloride. Action appears to be between chlorpromazine and imipramine. 70 neurotic outpatients suffering from anxiety were used in a parallel double-blind design. No significant differences were observed on rating scales between drug and placebo. Marked individual differences were noted between patients in response to the same dose of the drug (some were excessively sedated and some were not affected by the dose). The major side effect was drowsiness.—*E. M. Upchurch*.

4451. López-Ibor Aliño, J. J. & de Córdoba, E. Fernández. (U. Madrid, Medical School, Spain) **Notas terapéuticas: Ensayo preliminar sobre la metisergida en el tratamiento de las fases maniacas.** [Therapeutic notes: Preliminary essay on methysergide in the treatment of manic phases.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Jul), Vol. 28(3), 165-170.—Describes a study which tests W. G. Dewhurst's hypothesis that methysergide significantly blocks group A (stimulating) cerebral amine receptors in mania. 6 manic adult patients were administered methysergide in various doses, up to 16 mg/day. Effects in 4 Ss were extraordinary improvement in the lessening of psychomotor disorders, verbosity, ideofugitive thoughts, and excited states. However, in 2 Ss where hypertymia was accompanied by anxiety or dystymia, methysergide did not appear to be effective. Improvement was also noted in 2 Ss where diacepoxides were used in conjunction with methysergide. The desired clinical effects were reached in 1-2 wk. Dewhurst's hypothesis was only partially confirmed, with speculation that the disequilibrium of cerebral amines is not as

unequivocal as postulated or that methysergide does not uniformly block the group A receptors. (English summary)—*P. Hertzberg*.

4452. Medina Gil, C. & Díaz González, A. (Oviedo Psychiatric Hosp., San Sebastian, Spain) **Estudio clínico del TPN-12 en treinta y seis enfermos afectos de cuadros psicóticos agudos.** [Clinical study of TPN-12 in thirty-six severe psychotics.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Jul), Vol. 28(3), 171-183.—Describes the methodology and results obtained from the administration of a neuroleptic, triphosphopyridine nucleotide-12 (TPN-12) (imagotan) to 36 severe psychotics. With a few exceptions, oral doses between 300-450 mg/day were used. Best results were noted in paranoid schizophrenics and manic depressives in the manic phase, and global results were considered to be very satisfactory. Results were also validated through analyses on the Brief Psychiatric Rating Scale. Many extrapyramidal and secondary effects were observed. These diminished or disappeared with a lowered dosage of TPN-12 or were controlled with a benzatropine derivative (ponalid).—*P. Hertzberg*.

4453. Petursson, Esra S. & Preble, Edward. (Manhattan State Hosp., New York, N.Y.) **The use of cyclazocine in the treatment of heroin addicts.** *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 549-551.—Describes the treatment of 62 21-40 yr. old male heroin addicts with cyclazocine, a nonaddictive benzomorphan derivative analgesic. Clinical and psychological examinations obtained on all Ss indicated that about 75% had personality disorders. Results after 33 mo. of the cyclazocine program show that 36 Ss completed the hospital program and went to aftercare status. Of these, 11 eloped from aftercare, and 14 were still on cyclazocine maintenance at the end of the study period. Evaluation of the 14 aftercare Ss showed adaptation ratings as follows: 7 good, 6 fair, and 1 poor. It is felt that the low toxicity and nonaddictive properties of cyclazocine make it relatively safe for treatment of narcotic addiction and effective with those addicts who have a strong motivation for recovery.—*P. McMillan*.

4454. Rock, Nicholas L. **Long-term psychotherapy utilizing trifluoperazine in a psychotic preschool child: A case study.** *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 546-549.—Presents a case report of a 4-yr-old psychotic girl with whom trifluoperazine was used for over 1 yr. This treatment reduced psychotic behavior and produced no observable physical damage. The only adverse reaction was related to exceeding maximum therapeutic dose. Psychotherapy without the drug was slow and unrewarding for both therapist and family, but during therapy with trifluoperazine, S showed a rapid progression in acceptable behavior to the point where she was able to tolerate separation from the family and enter residential treatment. This case, and several others now treated with major tranquilizers, in particular trifluoperazine, indicate that the early use of such medication appears safe and beneficial enough to warrant its routine use.—*Journal summary*.

4455. Rogova, T. A. (Inst. of Pediatrics, Obstetrics, & Gynecology, L'vov, USSR) **Izmeneniya nekotorykh pokazatelei azotistogo obmena u novorozhdennykh detei s vnutricherepnoi rodovoi travmoj.** [Changes in some indices of nitrogen metabolism in neonates with intracranial birth injury.] *Pediatriya*, 1970, Vol. 49(3), 30-32.—Examined 51 full-term infants with intracranial circulatory disorders and 15 healthy infants as controls.

Nitrogen metabolism was adversely affected in those with intracranial birth injury. Glutaminic acid exerted a positive therapeutic effect.—*I. D. London.*

4456. Rossi, Romolo, et al. (U. Genes, Italy) **Aspects sociologiques de la thérapeutique neuroleptique ambulatoire en Italie.** [Sociological aspects of ambulatory neuroleptic therapy in Italy.] *Hygiène Mentale*, 1969(May), Vol. 58(2), 33-50.—Specifically studies sociological aspects of the introduction of neuroleptics into psychiatric treatment. Use of neuroleptics was studied in a university outpatient clinic. Patients are primarily upper class, but this reflects the population base. The main difficulties related to insufficient dosage and inadequate follow-up. It was felt that these defects were linked to the lack of trained parapsychiatric personnel and an adequate clinical structure to carry out the drug treatment program. (17 ref.)—*W. W. Meissner.*

4457. Simeon, Jovan; Fink, Max; Itil, Turan M., & Ponce, Danilo. (New York Medical Coll.) **D-cycloserine therapy of psychosis by symptom provocation.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 80-88.—This drug was given to 10 severely ill mental patients in dosages from 1-2 gm/day for 18 days to 16 wk. While the therapeutic benefits of cycloserine treatment alone were poor, subsequent treatment with active psychotropic drugs resulted in marked improvement, with 6 patients discharged and 3 working in the hospital 6 mo. after the study. This sequence of treatments (activation followed by psychotropic drug treatment) is called symptom-provocation therapy. D-cycloserine is an effective agent for symptom provocation with the unique advantage that an effective range can be defined by simple blood level estimations. (23 ref.)—*D. Prager.*

4458. Simeon, Jovan; Fuchs, Maria; Nikolovski, Oliver, & Bucci, Luigi. **Ketipramine in the therapy of depression in outpatients.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 342-346.—Describes a double-blind study comparing the clinical efficacy of ketipramine with imipramine as part of an evaluation of new treatments for patients unimproved by standard procedures. Ss were 51 21-62 yr. old depressed outpatients of a mental health clinic. Depression rating scales, resting EEGs, and clinical laboratory tests were obtained at regular intervals on each S. Results indicate that in equivalent doses, ketipramine was as effective as imipramine as an antidepressant, although Ss taking ketipramine experienced slightly lesser degrees of secondary effects. No laboratory abnormalities were noted with either drug. The study was handicapped by an early response to placebo, failure of Ss to take medication regularly, and a high drop-out rate.—*P. McMillan.*

4459. Tapia, Fernando. (U. Missouri, School of Medicine) **Haldol in the treatment of children with tics and stutterers—and an incidental finding.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 647-649.—2 of 12 stutterers improved with Haldol. 5 of 6 ticquers, ages 9-17, showed a 50-90% reduction of tics. 2 female ticquers who had obsessive-compulsive symptoms in addition to the tics had these symptoms disappear while the tics were continuing to be treated. The speculation is offered that Haldol seems to be particularly effective against whatever mechanism sets up the obsessive-compulsive, ruminative concerns which in turn bring on or aggravate tics, Tourette's disease, and perhaps some forms of stuttering. Haldol showed no untoward side effects when used in children under 12 yr. of age.—*D. Prager.*

4460. Ucko, Felix A. **Psychotropics in anxiety and depression: Combination or single agent?** *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 539-541.—Describes a double-blind controlled comparison of a combination of amitriptyline-fluphenazine vs. amitriptyline for the treatment of 87 anxious and depressed hospitalized patients. Data indicate that the combination drug was more effective than amitriptyline alone. Responses of Ss were more often rated excellent or good on the combination therapy (85%) than on the single drug treatment (65%). In addition, significantly fewer Ss receiving the amitriptyline-fluphenazine combination registered side effects (10 vs. 21).—*Journal summary.*

4461. van Renyngbe de Voxxle, G. **L'Anafranil (G 34586) dans l'obsession.** [Anafranil (G 34586) in obsession.] *Acta Neurologica et Psychiatrica Belgica*, 1968(Oct), Vol. 68(10), 787-792.—Administered anafranil (chlorimipramine) by iv perfusion in a single daily dose to 15 adult male and female Ss with obsessive-compulsive neuroses previously resistant to drug treatment. Rapid beneficial action of anafranil was noted by the 1st wk. in 4 Ss, and during the 2nd wk. in 6. The drug was generally well tolerated, but among minor side effects drowsiness early in treatment led to interruption of treatment in 2 Ss. This paradoxical effect occurred frequently in the series and was often the prelude to rapid improvement. The antidepressive and anxiolytic properties of anafranil are confirmed, and it appears to be the most efficient of the current antidepressive agents against obsession. (English, German, & Flemish summaries)—*T. N. Webster.*

4462. Worthington, Alan G. (Trent U., Peterborough, Ontario, Canada) **A note on "tranquillizers and perceptual defensiveness."** *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 330-332.—Critiques and evaluates a study by W. H. Coons and H. Annis (see PA, Vol. 44:12759) indicating that tranquilizers (specifically chlorpromazine) "appear not to reduce the defensive tendencies of patients in the manner previously suggested by other authors." It is suggested that because of methodological problems, which led to "a confounding of perceptual and response effects," data from this study do not necessarily lead to the conclusions reached. It is also noted that the method of analysis used is not entirely appropriate for testing the main hypothesis concerning the interaction of drug conditions and testing sessions.—*P. McMillan.*

HOSPITAL CARE & INSTITUTIONALIZATION

4463. Carp, E. A. (16 Leidsestraatweg, Oegstgeest, Netherlands) **Sartre und die Grundlagen der modernen Soziotherapie.** [Sartre and the basis of modern sociotherapy.] *Psychotherapy & Psychosomatics*, 1969, Vol. 17(2), 119-125.—Discusses the principles of modern sociotherapy, as developed especially by French psychotherapists, after Herman Simon had taken the 1st steps towards creating a social setting for mental patients appropriate to hospital life. Demonstrates how ideas as expressed in his *Critique de la raison dialectique* are in keeping with these principles.—*English summary.*

4464. Chinsky, Jack M., & Rappaport, Julian. (U. Connecticut) **Attitude change in college students and chronic patients: A dual perspective.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 388-394.—Assessed both initial attitudes and attitude

change among 30 college students and 320 chronic patients participating in a hospital companionship program. Student attitudes toward a number of mental health concepts were initially similar to 2 student control groups ($N = 30$ each). Patient expectations of college students likewise were similar to patient controls. At the conclusion of the program, students manifested significantly more favorable attitudes toward patients and less favorable attitudes toward the mental hospital; patients saw the students as more nurturant than they had initially expected. A social hierarchy hypothesis is advanced to partially account for the reported success of similar companionship programs. (22 ref.)—*Journal abstract*.

4465. Davis, Daniel; Rubin, Sidney, & Sonne, Thomas R. (Veterans Administration Hosp., Canandaigua, N.Y.) **Evaluation of a hospital activity program for released psychiatric patients.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 675-684.—A group ($N = 479$) of long-term psychiatric patients who were released to foster homes with participation in a hospital-based daily activity program was compared to a matched group released without such a program. At the end of 1 yr., the average number of days in the community was 35% higher for the activity group. After the 2nd yr. there was no significant difference in length of time-out of the hospital between the activity group and the comparison group. However the activity group had a longer in-hospital stay prior to release, fewer viable marriages, and a poorer work record than did the comparison group. This program is perceived as 1 which has contributed to making community placement more acceptable to both patients and community.—*Journal summary*.

4466. Duran, Fernando A. & Errion, Gerald D. (Northeast Kingdom Mental Health Service, Newport, Vt.) **Perpetuation of chronicity in mental illness.** *American Journal of Nursing*, 1970(Aug), Vol. 70(8), 1707-1709.—The manner in which patients in mental hospitals are classified, treated, and cared for tends to induce and perpetuate chronicity, e.g., artificial living conditions, mass handling, psychologizing indoctrination, and depersonalizing attitudes. An experiment in California schools was cited in which children selected at random were identified as "late bloomers." The children's school performance improved and this was presumed to be a result of the changed attitudes and expectations of the teachers. It was proposed that the same approach might yield results among the chronic population of a mental hospital. The nursing profession must assume the initiative and must create the milieu of a patient-centered environment rather than one based on the convenience of the staff. It is the nurses responsibility because they provide the necessary continuum of relationships and therefore must assume the largest share of responsibility.—B. A. Burkard.

4467. Fischer, Edward H. (Connecticut Valley Hosp., Middletown) **College students as companions to long-term mental hospital patients: Some considerations.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 308-310.—51 student volunteers for a companionship program each visited a mental hospital patient 1 hr/wk, for an average of 18 wk. Ss' ratings of certain aspects of patients' appearance and behavior correlated with psychiatric aides' ratings of patients' contact. But only the behavior ratings (rather than appearance ratings) correlated significantly with Ss' liking for the relationship. Patients' sex, education, years

of hospitalization, and age were the best predictors of Ss' interest in future companionship. Some implications are that the Ss' apparent discouragement in relating to chronic patients might be lessened if experienced students were assigned to long-term patients and if the period of companionship were shortened.—*Journal abstract*.

4468. Foreyt, John P. & Felton, Gary S. (Student Development Center, Los Angeles, Calif.) **Change in behavior of hospitalized psychiatric patients in a milieu therapy setting.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 139-141.—Describes milieu therapy as operating from the principle "that behavior will improve as a function of an environment which is structured to meet emotional needs by providing human relationships, by minimizing psychological conflict and deprivations, and by strengthening impaired ego functions." To evaluate change in behavior as a result of such therapy, 67 17-86 yr. old psychiatric patients were tested for their ward behavior, using 18 subscales of the Behavioral Inventory for Chronic Schizophrenics. Raters were 6 therapists and 6 attending staff coworkers. Results indicate that (a) all Ss improved except those categorized as "senile dementia" and "adjustment reaction to adult life," (b) psychotic Ss showed greater absolute improvement in score than nonpsychotic Ss, and (c) "improvement was directly proportional to length of stay." Various factors possibly influencing results are explored.—P. McMillan.

4469. Herrera, Julio J., Espinosa, Nolberto, & Cortopassi, Licenciada O. (U. Mendoza, Medical School, Argentina) **La comunidad terapéutica en psiquiatría.** [The therapeutic community in psychiatry.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Apr), Vol. 28(2), 100-115.—Discusses (a) the adaptation problems of an individual as either a condition or result of mental illness, (b) the concept of community and the benefit of social psychiatry in hospitals, (c) the phenomenology of the therapeutic community, (d) reasons for the emergence of a therapeutic community in a psychiatric hospital, and (e) the psychological rehabilitation of alcoholics in a therapeutic community. The therapeutic community is regarded as an intent to reconstruct the everyday world from which the patient was separated by illness. The therapeutic value is considered to be in the open communication with doctors and other patients and in the communal spirit of concern that emerges.—P. Hertzberg.

4470. Janes, Robert G. & Welsz, Alfred E. (Stanford U., Medical School) **Psychiatric liaison with a cancer research center.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 336-345.—Psychological stresses on patients and staff observed over a 6-mo period in a 15-bed facility are described from the viewpoint of the liaison psychiatrist. The resident is in conflict with the nursing and paramedical staff, and the patient is too preoccupied to understand the detailed explanations of the research team. 5 suggestions to reduce stresses are presented. It is concluded that the liaison psychiatrist is most valuable if he can model his interviewing expertise with patients for members of the ward staff.—D. Prager.

4471. Kahana, Eva & Coe, Rodney M. (Washington U., Medical Care Research Center) **Self and staff conceptions of institutionalized aged.** *Gerontologist*, 1969(Win), Vol. 9(4, Pt. 1), 264-267.—Compared self-conceptions and professional ($N = 8$) and nonprofessional ($N = 8$) staff views of 39 59-92 yr. old

ambulatory residents. Results show consistent differences between self-evaluations and staff views which tended to be depersonalized, positive, and oriented to present interpersonal behavior. Professional staff described residents in the framework of their particular professional perspectives, while nonprofessionals viewed them in affective terms and based on their manageability. Residents presented fairly well differentiated self-conceptions. Old-time residents presented views more similar to those of staff than newer residents, suggesting that staff expectations and attitudes may contribute to the depersonalizing process on institutionalization even when staff evaluations of residents are generally positive.—*M. Maney.*

4472. **Lapue, Paul S.** (U. Massachusetts) **Behavior modification and stimulus generalization.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 396.

4473. **Mezey, Alex G. & Evans, Eileen.** (North Middlesex Hosp., London, England) **Psychiatric admissions from North London related to demographic and ecological characteristics.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 187-193.—Marked differences were found in hospital admissions from 3 boroughs. Higher mental disorder admission rates were found where there was a declining population and more elderly, more single and previously married persons, low socioeconomic groups, more population mobility, more people born outside the United Kingdom, more 1-person households, and poor housing conditions.

4474. **Neel, Ann F.** **Reflections on "Psychological distance as a function of length of hospitalization."** *Psychological Reports*, 1970(Feb), Vol. 26(1), 46.—Examines A. Tolor and M. S. Donnon's (see PA, Vol. 44:18890) conclusion that long hospitalization increases psychiatric patients' desire for social involvement. Given a sample of patients which contaminates differences in length of hospitalization with differences in social class, physical setting, and diagnosis, and taps differential sensitivity to E effects, this potentially important conclusion is not justified.—*Author abstract.*

4475. **O'Morrow, Gerald S.** (Columbia U.) **A study of recreation service to psychiatric patients in relation to pre-discharge planning and aftercare.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 244.

4476. **Rosenberg, Stanley D.** (Dartmouth Coll., Medical School) **The disculturation hypothesis and the chronic patient syndrome.** *Social Psychiatry*, 1970(Jul), Vol. 5(3), 155-165.—From a population of psychiatric crisis patients seen at the emergency room of a city hospital, some are sent to the emergency treatment service (ETS) of a state mental health center. This service is a small, short-term treatment facility designed to avoid many of the negative features of the traditional hospital environment. The small size of the unit leads to a situation where some patients, considered by the reviewing resident to be appropriate ETS candidates, cannot be accommodated. A high percentage of these cases are sent to a traditional type of public mental hospital. By taking measures on 15 ETS and 11 state patients at admission and discharge, the impact of the hospital environment on certain aspects of patient personality and self-image was determined. Major findings indicate that the traditional hospital environment engenders and encourages dependency but that there is a complex interrelation between institutional demands and personality predispositions. Individuals who become long-term mental patients seem to be

characterized by a high degree of dependency and a negative definition of self. The hospital environment is thus congruent with certain of their personality demands. Conversely, autonomous individuals seem not to be easily molded by the hospital demands and are able to vacate the patient role very quickly. (French & German abstracts) (16 ref.)—*Journal abstract.*

4477. **Wijffels, N. & Janzing, C.** **Psychologie van de ziekenhuispatiënt en de Amsterdamse Biografische Vragenlijst.** [Effects of hospitalization on personality using the Amsterdam Biographical Questionnaire.] *Gawein*, 1969(Mar), Vol. 17(2-3), 109-121.—Administered the Amsterdam Biographical Questionnaire to 50 patients in order to test the hypothesis that regression would cause an increase in neuroticism scores. The hypothesis was not supported. However, an increase in extraversion scores was found. Results indicate that a hospital stay changed the Ss' personalities to more extraverted behavior, especially of 35-44 yr. olds.—*English abstract.*

4478. **Wretmark, Gerdt.** (Psychiatrische Klinik Regionalkrankenhaus, Linköping, Sweden) **Der Organisationsplan der psychiatrischen Klinik in Linköping, Schweden: Das psychiatrische Krankenhaus als gruppentherapeutische Situation.** [The organizational plan of the psychiatric clinic in Linköping, Sweden: The psychiatric hospital as a therapeutic group situation.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1969(Nov), Vol. 19(6), 229-240.—The Psychiatric Clinic in Linköping (Sweden), which forms part of a regional public hospital, has been restructured along social-psychiatric lines. This clinic is equipped with numerous ambulatory services of various types and has developed into a community health center. The organizational plan of the clinic which has been completely structured around the idea that the patient and service personnel form a community which in turn forms part of human society is described.—*English summary.*

PSYCHOANALYTIC INTERPRETATION

4479. **Appelbaum, Ann.** **Transactions of the Topeka Psychoanalytic Society.** *Bulletin of the Menninger Clinic*, 1970(Jul), Vol. 34(4), 257-260.—Discusses a paper presented to the Society in 1969 by Ernst Ticho, training analyst, on the subject of "Clinical Thoughts about the Current Concept of the Superego." The paper outlines "the development of the superego from heteronomy (dependence on external directives) to relative autonomy, and describes technical measures facilitating development of authentic superego in psychoanalytic treatment."—*J. Z. Elias.*

4480. **Bradley, N.** **The knees as fantasied genitals.** *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 65-94.—The unconscious associations of the knees and the male and female genitals or parts of them are demonstrated in both men and women by clinical evidence from 7 patients and by cultural material widely distributed geographically and historically. Some developmental reasons for the associations are suggested. Cultural evidence stimulates clinical awareness and reduces scotomata prevalent in the culture to which the analyst belongs. (48 ref.)—*Journal summary.*

4481. **Bychowski, G.** **Activity and reality.** *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 29-46.—Human activity is either goal directed or it is pursued for its own sake. When pursued for its own sake, activity is an aspect

of the person's experience of a sense of expansion and being. The basis of activity per se: its origins, the drive tendencies associated with it, and its outcome are discussed.—*D. Prager.*

4482. Chanover, E. Pierre. Marcel Proust: A medical and psychoanalytical bibliography. *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 638-641.

4483. Domhoff, G. W. Two Luthers: The traditional and the heretical in Freudian psychology. *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 15-17.—Erik Erikson and Norman Brown have recently published portraits of Luther. These 2 studies are examined to demonstrate a deep split in current Freudian thinking which aligns the neo-Freudians and ego psychoanalysts as traditional scholars against the scattered few from many disciplines who are the heretics. (13 ref.)—*D. Prager.*

4484. Domhoff, G. William. (Cowell Coll., Santa Cruz, Calif.) But why did they sit on the king's right in the first place? *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 586-596.—Discusses the possible beginnings of the left-right, bad-good dichotomy in the dualism of primitive thought. Left symbolizes the wish-fear conflicts of the taboo. The ambivalence of left is seen by its symbolizing both unbridled sexuality and also castration, weakness, impotence, and homosexuality. This dichotomous thinking "may have fastened on the slight genetic tendency for right bilaterality and . . . [invested] it with the good-bad, active-passive, potent-castrated polarities . . ." The nobles sat on the king's right because they identified with the King-Father and his rightest values. The capitalists and dissident intellectuals were on the left, espousing mother-derived values. (20 ref.)—*M. West.*

4485. Gardner, R. A. The use of guilt as a defense against anxiety. *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 124-136.—Discusses the role of guilt as a method of achieving control over the uncontrollable. The use of this type of guilt reaction is demonstrated in a discussion of the origin of religious beliefs, the involuntal depressive reaction, and in certain types of schizophrenic reactions. This concept lends greater understanding to the inappropriate guilt reaction of parents of children with severe physical illness, to scapegoatism, prejudice, and other neurotic and psychotic phenomena. This type of guilt is only 1 of many, but it has not received the attention it deserves in psychoanalytic literature.—*D. Prager.*

4486. Geha, R. Dostoevsky and "The Gambler": A contribution to the psychogenesis of gambling: I. *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 95-123.—Attempts to decipher the infantile complexes reflected in the novel, *The Gambler*, with a view to contributing to the psychogenesis of gambling.—*D. Prager.*

4487. Guarnier, E. Some thoughts on the symbolism of bullfights. *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 18-28.—In 2 bullfighter cases it was found that the artistic creation in bullfighting was a relief of the intolerable tensions from the fear of death or the aggression toward a feared object with which the artist must be reconciled. Contact with the brave bulls develops the bullfighter. Bullfighting may be the result of a negative Oedipus complex in the Spanish-speaking countries. There is an attempt to overcome this conflict through the omnipotent control over the fear of death and over the father who abandons his home very early in his son's life. (15 ref.)—*D. Prager.*

4488. Hoffs, Joshua A. Comments on psychoan-

alytic biography with special reference to Freud's interest in Woodrow Wilson. *Psychoanalytic Review*, 1969, Vol. 56(3), 402-414.—Describes the book *Thomas Woodrow Wilson, A Psychological Study* by Sigmund Freud and William C. Bullitt. Freud is seen as having written little besides the introduction. Discusses the "objections to a psychoanalytic study of historical personalities" and offers "a justification for such an approach." (25 ref.)—*M. West.*

4489. Holzhey, Helmut. (1 Heggerstr., Schwerzenbach, Switzerland) *Psychoanalyse und Gesellschaft: Der Beitrag Herbert Marcuses*. [Psychoanalysis and society: The contribution of Herbert Marcuse.] *Psyche, Stuttgart*, 1970(Mar), Vol. 24(3), 188-207.—Although Marcuse considers Freud's psychoanalytic theory no longer directly applicable to the "1-dimensional man" of the present-day society, this does not invalidate the "historical truth" of psychoanalysis which, as method, holds out the possibility of a society without "surplus repression." Essentially regeneration of society is looked for from the ahistorical drives, against the historically constituted social and political repressive institutions and cultural patterns.—*E. W. Eng.*

4490. Hurvich, Marvin. (333 W. 57th St., New York, N.Y.) On the concept of reality testing. *International Journal of Psycho-Analysis*, 1970(Aug), Vol. 51(3), 299-312.—Reality testing includes attention, perception, memory, secondary process thinking, delay of discharge, judgment and reflective awareness. Freud distinguished between ideas and perceptions. Later writers have included acquiring knowledge of realities through learning and drawing logical conclusions from perceptions and memories. Freud assumed a loss of external reality awareness in psychosis; recent writers use the transience and reversibility of reality testing to delineate psychosis from borderline states. Studying attention will probably lead to increased knowledge of reality testing. (93 ref.)—*Journal summary.*

4491. Joseph, Robert J. John Ruskin: Radical and psychotic genius. *Psychoanalytic Review*, 1969, Vol. 56(3), 425-441.—Ruskin was overtly psychotic for the last 10 yr. of his life and at intervals during the preceding decades. His history and psychodynamics are reviewed to support the position that Ruskin was schizophrenic rather than manic depressive. His life and work can be understood best in terms of a severe sadomasochistic character, the defenses of which gradually broke down. Most of these defenses were evident in Ruskin's writing. Introjection, incorporation, and projection were prominent, as well as reaction formation and denial. Ruskin's commentaries on art and society have relevance for the psychology of artistic creativity and for social psychiatry. (28 ref.)—*D. Prager.*

4492. Lincke, Harold. (11 Spiegelgasse, Zurich, Switzerland) *Das Überich: Eine gefährliche Krankheit?* [The superego: A dangerous illness?] *Psyche, Stuttgart*, 1970(May), Vol. 24(5), 375-401.—The formation of the Western superego represents a shift from primacy of the extended-family community to that of the small family and idealized parental figures, involving heightened ambivalence. Self-justification now assumes the form of attempts to dominate nature by changing the surround. But subsequent rapid changes of the surround now overtax the adaptive capacities of an ego controlled by a rigid superego. With this arises the current temptation to resort to new forms of regression as a defense against the superego. An example of this may be seen in contemporary art as a protest against the

intellectualization characterizing modern life. (English summary) (25 ref.)—*E. W. Eng.*

4493. Little, R. B. **Behind the dream screen.** *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 137-142. —Presents material to demonstrate another function of the dream screen: to inhibit the production of anxiety by blocking out painful stimuli. In this case, behind the dream screen lurked the frightening Oedipal father whose presence was hidden from the dreamer.—*Journal summary.*

4494. Meerloo, Joost A. **Eichmannism: Cold violence and robotized pugnacity.** *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 609-614. —The impersonal device of automatic action is often resorted to as a defense against inner guilt and hostility. Defensive, automatic overdoing becomes a compulsion to cover up early interpersonal conflicts. When automation as a means becomes the great aim in life, the destructive and conscienceless robot is born. Eichmannism is a disease of the mechanized soul of mankind.—*D. Prager.*

4495. Mintz, Thomas. **The meaning of the rose in "Beauty and the Beast."** *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 615-620. —The rose lends itself to representing both the Beast's masculinity and Beauty's femininity. The dominant latent meaning of the rose in the tale represents the beginnings of female sexuality in the woman. (16 ref.)—*D. Prager.*

4497. Perry, John W. (U. California, San Francisco) **Emotions and object relations.** *Journal of Analytical Psychology*, 1970(Jan), Vol. 15(1), 1-12. —The occurrence of any emotion consists of the interplay between 2 complexes. Emotional life is structured in bipolar systems or pairs of complexes. The S experiences the affect that belongs to the complex with which the ego aligns itself and assigns the other pole to the object. During the emotion the energetic value of the ego is lessened and that of the complex heightened; in this situation there is an interrelation between the affect-ego and the affect-object. In such a moment the self-image is altered as is the image of the object. Through the interplay of these complexes consciousness and the rounding out of the personality takes place. (22 ref.)—*P. Federman.*

4498. Reid, Stephen A. (San Fernando Valley State Coll.) **"I am misanthropos": A psychoanalytic reading of Shakespeare's "Timon of Athens."** *Psychoanalytic Review*, 1969, Vol. 56(3), 442-452. —"The starkness of Shakespeare's presentation of Timon's uncontrollable hatred dominates the play. And this is perhaps I reason Shakespeare lost interest in it before he could bring it to a final form."—*D. Prager.*

4499. Robinson, Ira E. & Clune, Francis J. **Sexual symbolism and archeology.** *Psychoanalytic Review*, 1969, Vol. 56(3), 468-480. —The vital characteristics of man and his inability to construct a universe totally different from the 1 in which he lives makes it necessary that he conceptualize and symbolize unknowns and knowns in an anthropomorphic fashion. The analysis of the Aztec and Toltec Ball Game is presented in terms of this theory. (23 ref.)—*D. Prager.*

4500. Rogers, Robert. (State U. New York, Buffalo) **A psychoanalytic study of the double in literature.** Detroit, Mich.: Wayne State U. Press, 1970. ix, 192 p. \$7.95.

4501. Rosenblatt, Allan D. & Thickstun, James T. (3010 1st Ave., San Diego, Calif.) **A study of the concept of psychic energy.** *International Journal of Psycho-Analysis*, 1970(Aug), Vol. 51(3), 265-278. —Freud's training in physics led him to apply the psychic energy concept (force and counterforce) to psychological phenomena. A mind-body dualism is implied. This energy is quantifiable and has an aim. Its source is in the instinctual drives. Energy is discharged through the pleasure, constancy, and Nirvana principles. A theory should explain all relevant data, have internal consistency, and have few proliferating subpropositions. The psychic energy concept theory fails in all 3 categories. The theory should be abandoned and a behavioral alternative which articulates with neurophysiological data be substituted. The author does not feel responsible to substitute another theory. If and when this theory is abandoned, psychoanalytic theory will be free to develop a satisfactory new alternative. (39 ref.)—*J. S. Chyatte.*

4502. Sandler, J., Holder, A., & Dare, C. (Inst. of Psychiatry, London, England) **Basic psychoanalytic concepts: V. Resistance.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 215-221. —The concept of resistance has been extended to include all the obstacles to the aims and procedures of treatment which arise from within the patient. In this sense the term is applicable not only to psychoanalysis but to problems encountered in ordinary medical practice, including forgotten appointments, misunderstood instructions, rationalizations for breaking-off treatment, etc. Methods of treatment should be chosen to by-pass sources of resistance or should include allowance for adequate handling of resistances that arise. (37 ref.)—*R. L. Sulzer.*

4503. Schafer, Roy. (Yale U.) **The psychoanalytic vision of reality.** *International Journal of Psycho-Analysis*, 1970(Aug), Vol. 51(3), 279-297. —I aim of psychoanalysis is the patient's reliable reality testing, both internal and external. I version of reality in psychoanalytic theory is a comic one, e.g., no obstacle or evil is too great to be overcome—"positive thinking" approach. The romantic vision of reality sees life as a series of quests with the seeker a movie cowboy hero type. The tragic vision entails the recognition of the dangers and defeats hovering in every situation. The ironic vision seeks out the contradictions, ambiguities, and paradoxes and overlaps the tragic vision somewhat. Clinical analysis sharpens the sense of reality and intensifies the tragic and ironic aspects. This is part of Freudian analysis and must be recognized as such. (57 ref.)—*J. S. Chyatte.*

4504. Seidenberg, Robert. (State U. New York, Upstate Medical Center, Syracuse) **Catcher gone awry.** *International Journal of Psycho-Analysis*, 1970(Aug), Vol. 51(3), 331-339. —Everyone is a missionary and a therapist seeking to help others. Rescuers are selfish using their victims as a means to self-glorification. Using this premise the author interprets Arthur Miller's "After the Fall." Weakness attracts especially if a characteristic of a female. The "catcher" is an active rescuer while his opposite is the indifferent person who hesitates to intrude in the lives of others. Marriage to either a militant rescuer or an indifferent individual can lead to disastrous results.—*J. S. Chyatte.*

4505. Socarides, Charles W. (210 E. 78th St., New York, N.Y.) **A psychoanalytic study of the desire for sexual transformation ("transsexualism"): The plaster-of-paris man.** *International Journal of Psycho-Analysis*, 1970(Aug), Vol. 51(3), 341-349. —Transsex-

ualism is a psychiatric syndrome characterized by an intense wish to be of the opposite sex through surgery or endocrine therapy, a belief one is basically of the opposite sex, and an imitation of behavior associated with the opposite sex. There is usually a search for transformation which may lead to self-mutilation. The case of Victor (Valerie) is described in detail. (48 ref.)—J. S. Chyatte.

4506. Sonnemann, Ulrich. (1 Am Jagdweg, Munich, W. Germany) **Hegel und Freud.** [Hegel and Freud.] *Psyche, Stuttgart*, 1970(Mar), Vol. 24(3), 208-218.—In his "phenomenology of the mind" Hegel pointed out the absurdities in which psychological thought eventuates, insofar as it bypasses the real involvements of individual and society by employing a naive concept of nature from the very outset. Such a fundamentally subjective world view, based as it is on a metaphysics of solipsism, is nurtured by experiences of estrangement and helplessness on the part of individuals within social institutions. A revision of Freudian concepts which would inform fresh social practices directed against the reductive objectivation of human beings is called for. (English summary)—E. W. Eng.

4507. Stierlin, Helm. (National Inst. of Mental Health, Adult Psychiatry Branch, Bethesda, Md.) **The functions of "inner objects."** *International Journal of Psycho-Analysis*, 1970(Aug), Vol. 51(3), 321-329.—Inner object functions are comparable but not identical to ego functions. Inner objects of psychoanalysis serve as inner referents, guideposts for interpersonal relationships, and contribute to the relative autonomy of the person. The inner objects are analogous to an inner gyroscope. Freud, Fairbairn, and M. Klein theories are compared. (30 ref.)—J. S. Chyatte.

4508. Stolorow, Robert D. **Anxiety and defense from three perspectives.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 685-710.—Threats to the individual's basis of selfhood may arise from a dreaded intrapsychic impulse, from a disharmonious interpersonal process, or from the ontological structure of existence itself. No 1 of the 3 levels is more basic than the others. A pluralistic orientation which treats each level of the anxiety-defense process in its own terms is favored. The ubiquitous processes of anxiety and defense permeate all levels of human existence—intrapsychic, interpersonal, and ontological. In a given cultural situation 1 or another of the 3 levels of anxiety may predominate. Psychotherapy should aim at clarification and working through of intrapsychic conflicts, developing interpersonal security, and fortifying the individual in his attempt to derive meaning from the human condition. (40 ref.)—D. Prager.

4509. Tarbox, Raymond. **A note on M. D. Faber's essay "Suicide and the 'Ajax' of Sophocles."** *Psychoanalytic Review*, 1969, Vol. 56(3), 453-460.—Discusses Faber's paper in terms of the elated suicidal process. Sophocles' Ajax is then compared with Ibsen's *Master Builder* in the light of an elated (aggressive) or ecstatic (libidinal) flight of denial resulting in the hero's death during the final manic phase of the suicidal process.—D. Prager.

4510. Waldman, R. D. **The sin-neurotic complex: Perspectives in religion and psychiatry.** *Psychoanalytic Review*, 1970(Jul), Vol. 57(1), 143-152.—Isolation, powerlessness, and loss of meaning lead to a resurgence of individualism and self-sufficiency characterized as sin. In this condition man becomes more vulnerable to the existential anxieties of guilt, death, and meaninglessness.

Specific neurotic strategies are described to resolve this crisis. Such strategies are ill-fated, just as neurotic strategies themselves are revealed as concealed forms of pretense and self-sufficiency that merely accentuate the original crisis. These similarities between the 2 forms of behavior are referred to as the sin-neurotic complex. (17 ref.)—D. Prager.

4511. Weinschel, E. M. (2380 Sutter St., San Francisco, Calif.) **Some psychoanalytic considerations on moods.** *International Journal of Psycho-Analysis*, 1970(Aug), Vol. 51(3), 212-320.—Moods are difficult to describe in words. Moods are not only affect but psychological structures in which behavioral and cognitive components exist. Moods are ego states and represent a revival of a previous state the S has experienced. Moods are pervasive. A mood represents a distortion of reality and a compromise with reality testing. Moods are difficult to classify at present. Moods provide a channel to discharge small quantities of cathectes and prevent haphazard affect discharge. (51 ref.)—J. S. Chyatte.

4512. Wexler, Frank. **The antiachiever: Dynamics and treatment of a special clinical problem.** *Psychoanalytic Review*, 1969, Vol. 56(3), 461-466.—The antiachiever is midway between the underachiever (with passive resistance to authority and learning) and the total, pervasive rebellion of the acting-out delinquent. The antiachiever openly rejects demands for academic success and has experienced no love or reward for work but an excess of criticism. Implications for treatment are discussed in terms of modifying the antiachiever's view of authority as demanding and unifying.—D. Prager.

4513. Withim, Philip. (Bucknell U.) **The psychodynamics of literature.** *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 556-585.—Engagement with a literary work involves the reader in achieving catharsis through the interaction of repetition compulsion, introjection, and isolation of affect. The gross structure of a literary work is analogous to id, ego, and superego. The tone and texture of a literary work as well as its patterned associations of sound, sense, and image help to carry the ego resources through a patterned sequence, chiefly through dream-work mechanisms of condensation and displacement. All these psychodynamic elements act together to manipulate, largely by way of the ego resources, the quality and relationship of the reader's id, ego, and superego. (33 ref.)—D. Prager.

PSYCHODIAGNOSIS

4514. Alderton, Harvey R. (Thistlethorn Regional Centre, Rexdale, Ontario, Canada) **The Children's Pathology Index as a predictor of follow-up adjustment.** *Canadian Psychiatric Association Journal*, 1970(Jun), Vol. 15(3), 289-294.—Investigated the predictive value of the discharge score in the Children's Pathology Index (CPI) of 16 boys who had been treated in a hospital for behavior disorders at least 6 mo. previous to the follow-up study. 4 factors have been derived from the CPI: I, disturbed behavior toward adults; II, neurotic constriction; III, destructive behavior; and IV, disturbed self-perception. Ss were divided into groups of those whose discharge Factor I scores were 157 or more, and those with lower scores (the 157 cut-off value having been previously found to separate "satisfactory" from "poor" follow-up adjustment). Results indicate that Group I Ss showed fewer antisocial

difficulties following discharge. Factor III was shown to predict antisocial difficulties but less effectively than Factor I. It is concluded that Factor I scores are sufficient to predict which Ss will have continuing antisocial disorders.—P. McMillan.

4515. Amiel, R. & Lebigre, F. **Un nouveau test rapide pour l'appréciation de la santé mentale: Son utilisation pour les dépistages précoces: Son intérêt dans les bilans de santé.** [A new rapid test for evaluating mental health: Its use for early screenings: Its value in health surveys.] *Annales Médico-Psychologiques*, 1970(Apr), Vol. 1(4), 565-580.—Discusses a French version of T. Langner's 22-item Screening Score of Psychiatric Symptoms Indicating Impairment. Total Health Test (THT) was renamed and prevalidated on approximately 500 Belgian and French Ss, including normal Ss and mental patients, of different age groups, and of varied social and cultural backgrounds. While the THT did not reveal all Ss with mental or psychosomatic disorders, it was of definite value in detecting as many as 70% of those requiring early treatment in order to prevent a possibly irreversible pathological outcome. This figure contrasted with 20% detected by physicians untrained in psychiatry during a single consultation.—T. N. Webster.

4516. Arnds, H. G. (Medizinische Universitätsklinik Freiburg, W. Germany) **Zum Verhältnis von psychoanalytischer und testpsychologischer Diagnostik.** [Psychoanalytic and psychological test diagnostics.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1969(Nov), Vol. 19(6), 249-255.—Starting from the differences in the stationary-psychotherapeutic adjustment between analytical attitude and daily reality behavior 14 various psychodiagnostic method groups are compared with regard to what they encompass in terms of their interpretation and their reference to the therapeutic process. Based on the current expansion of depth-psychological anamnesis, projective procedures and performance tests, a diagnostic model is described which displays clear analogies with the therapeutic model which has been proven so useful for stationary psychotherapy: here analytical attitude in addition to daily reality behavior is necessary for treatment. Accordingly, depth psychological anamnesis in addition to psychodiagnostic tests is indispensable. (30 ref.)—English summary.

4517. Ban, Thomas A., Lehmann, Heinz E., & Saxena, Bishan M. (Douglas Hosp., Montreal, Quebec, Canada) **A conditioning test battery for the study of psychopathological mechanisms and psychopharmacological effects.** *Canadian Psychiatric Association Journal*, 1970(Jun), Vol. 15(3), 301-308.—Reports results of an 8-yr study of test procedures developed to distinguish between normal and pathological states of the organism. The test battery consisted of 7 conditioning techniques used in 11 procedures, each requiring 30 min. to complete and tapping 12 experimental variables. Ss were 30-29-65 yr. old hospitalized chronic schizophrenics and 30-18-35 yr. old normal controls. Results show significant differences between normal and schizophrenic populations. Schizophrenic Ss showed impairment in their ability to extinguish an autonomic orienting reflex, and impaired "integrational" functions, i.e., generalization, differentiation, and delay (all inhibitory). On word-association response, the autonomic component consistently preceded the verbal response in the schizophrenic group. (French summary)—P. McMillan.

4518. Bednar, Richard L. & Weinberg, Steve L. (U.

Arkansas, Rehabilitation Research & Training Center) **Clinical judgments of client pathology and subsequent client improvement.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 443-446.—"Analysis of variance procedures were employed to determine the relationship between the accuracy of clinical judgments and subsequent client improvement among neurotic and psychotic patients." Therapist subjective judgments of client adjustment were measured by the Current Adjustment Rating Scale. The MMPI served as the criterion variable for therapist's judgments on 20 neurotic or psychotic Ss. Client improvement was obtained through an analysis of pre- and posttherapy MMPI scores. For neurotic Ss the more the therapist's judgment deviated from objective measures of client pathology the more client improvement was reported. For psychotic Ss, therapists moderately accurate in their judgments of client pathology were most successful in facilitating client improvement.—E. J. Kronenberger.

4519. Benfari, Robert C. & Leighton, Alexander H. (Harvard School of Public Health, Boston, Mass.) **PROBE: A computer instrument for field surveys of psychiatric disorder.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 352-358.—Developed a computer version of the Stirling County psychiatric evaluation procedure, consisting of sequential ratings, i.e., detailed symptom patterns and ratings of psychiatric status ("caseness"). Evaluations are concerned with field survey questionnaires and are used for research in psychiatric epidemiology. 290 respondents, evaluated by a group of trained psychiatrists, were used for the developmental steps of questionnaire item relationships to detailed symptoms, detailed symptom relationships to "caseness," and cross-validation of the relationships to an independent sample. The Likert item scale difference was used to assign weights to questionnaire items as they pertained to relevant detailed symptom patterns. Cross-validation results make it evident that the agreement between PROBE and the psychiatric joint evaluations is equal to or greater than base-line agreements. Implications for psychiatric epidemiology and evaluation are explored.—Journal summary.

4520. Bernot, J., Laurent, P., & Philonenko, A. **Élaboration et expérimentation d'un questionnaire psychiatrique de dépistage des affections mentales: Le psychorater.** [Elaboration and experimentation with a psychiatric questionnaire for screening mental disorders: The Psychorater.] *Bulletin Centre d'Etudes et Recherches Psychotechniques*, 1969(Jan), Vol. 18(1), 43-63.—Describes a psychiatric questionnaire (the Psychorater) which is undergoing development for use in screening mass populations for mental disorders. The questionnaire is comprised of 250 multiple choice questions. Part I concerns the individual's psychosocial relations with diverse institutions (i.e., family, social, professional, etc.). This part is based on the premise that social integration is a good criterion of "normality." Part II is composed of questions which screen for clinical aspects of specific mental illnesses and pathological personality manifestations.—B. A. Stanton.

4521. Bloom, Bernard L., Lang, Edward M., & Goldberg, Herbert. (U. Colorado) **Factors associated with accuracy of prediction of posthospitalization adjustment.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 243-249.—Judges predicted whether patients at the time of discharge from a public psychiatric hospital would be able to remain out for 1 yr., and indicated the reasons for their prediction. Ss included 92

discharged patients and judges included 79 nurses, aides, social workers, psychiatrists, psychologists, occupational therapists, and physical therapists. It was hypothesized that there would be a relationship between accuracy of prediction and characteristics of the judges and judgments. Results indicate that no single group of judges was clearly able to predict posthospitalization adjustment better than they could have had they simply predicted a successful outcome for every case regardless of the reasons used. Accuracy of prediction was found to be higher, however, in cases of high interjudge agreement than when agreement among judges was moderate.—*Journal abstract.*

4522. Blum, Donna M. (Carleton U., Ottawa, Ontario, Canada) **MMPI characteristics of males in a private hospital population.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 234.—Reports the distribution of MMPI T scores in 3 diagnostic groups—psychoses; psychoneurotic disorders; and disorders of character, behavior, and intelligence—within a randomly selected group of 90 male patients in a private psychiatric hospital. Results indicate that the MMPI only minimally differentiates these diagnostic groups.—*Author abstract.*

4523. Bondy, Milos. (U. Alberta, Edmonton, Canada) **Two cases of psychiatric symptoms following exposure to the Rorschach.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 432-434.—Describes a peculiar reaction of 2 psychiatric patients to the Rorschach test and tries to relate this phenomenon to some other Rorschach phenomena.—*Journal abstract.*

4524. Branzel, P. (Inst. of Medicine & Pharmacy, Iasi, Romania) **L'actualité nosologique dans la psychiatrie contemporaine.** [The present nosological interest in contemporary psychiatry.] *Annales Médico-Psychologiques*, 1970(Apr), Vol. 1(4), 505-520.—Outlines criteria for a dynamic bio-psycho-social classification in psychiatry, using the system of analysis and synthesis applied concomitantly to biopsychologic etiological causes in their syndromatic projections, including phenomenologic intensity and duration, as well as the objective and subjective logical significance of the ideofactive behavior of the person in his social interrelations. The following categories of mental disorders and diseases are defined: (a) psychogenies through conversion; (b) neuroses (nonintentional psychogenies, inborn or acquired); (c) psychopathies (as chronic disharmony of personality); (d) oligophrenies; (e) psychoses (a heterogenous group of illnesses and syndromes with variable etiology and development, characterized by an obvious disturbance of discernment regarding social interrelations—endogenous psychoses, including hyperthymic, hypothyrmic, and delirious systematized psychoses; exogenous psychoses determined by various traumatic, infectious, toxic, or deficiency causes; and endo-exogenous psychoses; and (f) dementia processes of psychic involutions.—*T. N. Webster.*

4525. Burns, Robert C. & Kaufman, S. Harvard. (Children's Orthopedic Hosp., & Medical Center, Seattle, Wash.) **Kinetic family drawings (K-F-D): An introduction to understanding children through kinetic drawings.** New York, N.Y.: Brunner/Mazel, 1970. 160 p. \$8.95.

4526. Carvalhaes Bonilha, Lúcia. (Pontificia Universidade Católica de São Paulo, Brazil) **Confronto entre dados do Psicodiagnóstico de Rorschach e do Teste das Pirâmides Coloridas.** [Comparisons be-

tween psychodiagnostic Rorschach results and the Color Pyramid Test.] *Revista de Psicologia Normal e Patológica*, 1968(Jan), Vol. 14(1-2), 48-66.—Correlated variables of the Rorschach and of Pfister's Color Pyramid Test (CPT) and studied interpretations drawn from data of 10 protocols of each test to realize an approach to the problem of coordination of interpretation of different projective techniques and to better understand the CPT's value. Interpretations of the tests were compared on: (a) intensity, efficacy, and type of general control of personality; (b) psychic integration; (c) intensity and quality of the action; (d) mode of action; and (e) several affective-emotional characteristics. 32 male and 36 female 20-30 yr. olds served as Ss. Results confirmed the hypotheses that there is a positive correlation between: (a) $FC < (CF + C)$ on the Rorschach and an excessive choice of purple on the CPT, and (b) the total number of Rorschach color responses and the CPT amplitude index. Agreement of configurative interpretation was satisfactory and an analysis of the most convergent or divergent aspects provided suggestions about the characteristics of the tests. (French summary) (20 ref.)—*English summary.*

4527. de Alarcón, R. **El diagnóstico precoz de las depresiones de la vejez.** [Earlier diagnosis of depressions of the aged.] *Revista de Medicina de la Universidad de Navarra*, 1968(Sep), Vol. 12(3), 193-207.—Investigated the diagnostic utility of hypochondriacal symptoms (HS) in 73 male and 79 female depressive Ss over 60 yr. old who were treated at a geriatric psychiatric hospital. 63.81% of Ss had HS at some stage of depression. HS were manifested alone or accompanied by other depressive symptoms from the beginning of illness in 72 Ss, while in 45 Ss, they appeared 2 wk-9 mo before classic depressive symptoms. All Ss with these HS had visited a doctor more than once and 28 Ss had been examined in 1 or more general hospitals, however, none of these had been examined psychiatrically to discover possible depression, and the correct diagnosis was reached only after the S had attempted suicide or had a crisis of agitation. Approximately 25% of Ss with HS attempted suicide, while only 3.28% of those without HS did. The importance of early diagnosis of depressive symptoms is discussed, and a simple system for psychiatric exploration intended to aid general practitioners in excluding the possibility of depression is suggested. (20 ref.)—*M. Maney.*

4528. Ernhart, Claire B. (U. Missouri, St. Louis) **The correlation of Peabody Picture Vocabulary and Wechsler Adult Intelligence Scale scores for adult psychiatric patients.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 470-471.—Correlations of the Peabody Picture Vocabulary Test (PPVT) and the WAIS Full Scale IQ, Vocabulary IQ, and Performance IQ were .86, .88, and .75, respectively, in a sample of 118 adult psychiatric patients. Means and standard deviations are also presented. A conversion equation is given to convert PPVT IQ standard deviations to WAIS standard deviations.—*E. J. Kronenberger.*

4529. Fiorentino, Diane; Sheppard, Charles, & Merlis, Sidney. (Central Islip State Hosp., N.Y.) **Emotions Profile Index (EPI) pattern for paranoid personality types: Cross-validation and extension.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 303-308.—Examined the possibility of defining an emotion profile consistent with personality type in a cross-validated study. The procedure contrasted 20 newly admitted acute paranoid

schizophrenic patients with 23 narcotic users, defined as paranoid personality types on the basis of their responses to self-report inventories. When the resulting Emotions Profile Index scores were compared for these 2 groups, they showed high similarity. This suggests the possibility of identifying emotion profile types which are consistent with underlying personality types.—*Journal abstract.*

4530. Gathercole, C. E., Bromley, E., & Ashcroft, J. B. (Rainhill Hosp., Liverpool, England) **The reliability of repertory grids.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 513-516.—53 Ss were given repertory grids consisting of 8 elements and 8 constructs to study the reliability of some commonly used forms of repertory grids. Reliability was assessed in 2 different ways. Results indicate that conclusions based on single grids are likely to be quite unreliable. 2 reasons for this unreliability are presented. "It is concluded that generalizations about patients based on single grids using the ranking method should be made with extreme caution, particularly if elicited constructs are used."—E. J. Kronenberger.

4531. Gauthier, Yvon, et al. **Le diagnostic et les fonctions du moi des enfants encoprétiqes.** [The diagnosis and functions of the ego in encopretic children.] *Canadian Psychiatric Association Journal*, 1970(Jun), Vol. 15(3), 265-277.—Studied the diagnosis, ego functions, and degree of affective deficiency in 35 encopretic children. Ss were divided into 2 main categories: neurotics and those suffering from ego disorders. The neurological and intellectual equipment of the latter group was below that of the neurotics, and they showed a marked tendency to an exaggerated or deficient motor control. Family troubles also contributed to the condition, which appeared to be due to developmental arrest, evident also in other areas. Neurotic Ss revealed depressive elements related to separation or threatened separation. Traumatic aspects were often more symbolic than real and repressed aggressivity appeared as an important feature. Ego-disturbed Ss presented significantly higher indications of affective deficiency, especially due to family environment. This study does not show why such Ss have chosen to become encopretic. It only indicates the type of family environment where the symptom develops, and identifies certain precipitating conditions. It also appears that the majority of parents will tolerate such a condition for a long time without seeking advice. This confirms the importance of family environment in the development of the symptom.—*English summary.*

4532. Gayton, William F. (Amherst H. Wilder Foundation, St. Paul, Minn.) **Validity of the Harris Quality Scale with a child guidance population.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 17-18.—Examined the relationship between the Harris Quality Scale and the Stanford-Binet Intelligence Test. When 50 male 5-14 yr. old patients in a guidance clinic were administered these tests as part of a regular psychological evaluation, the Quality Scale significantly underestimated the Binet IQs.—*Journal abstract.*

4533. Gayton, William F., Wilson, Winston T., & Bernstein, Stephen. (U. Minnesota, Health Sciences Center) **An evaluation of an abbreviated form of the WISC.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 466-468.—120 WISC scores were rescored according to Yudin's scoring system which utilizes selected items on 9-11 subtests while administering the complete Digit Span and Coding subtests. Correlations between

the original and the short-form results are presented. Subtest correlations ranged from .65 for Picture Completion to .89 for Block Design (Digit Span and Coding both yielding 1). Correlations for Verbal, Performance, and Full Scale IQ were .93, .90, and .89, respectively. There was a considerable drop in correlations when Verbal-Performance discrepancies were used. Further analysis of the Yudin short form is suggested.—E. J. Kronenberger.

4534. Gibby, Robert G. & Lee, William M. (Veterans Administration Hosp., Richmond, Va.) **The relationship of rate of change of heart rate to MMPI variables.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 491-493.—15 male patients with a high rate of change of heart rate (labile) were compared on the MMPI with 15 Ss with a low rate of change of heart rate (stable). Stable Ss achieved higher mean scores on the Hs, D, Hy, and R scales. Significant relationships between heart rate lability and the K and Taylor MA scales were not found. Findings suggest that cardiac stability may be associated with degree to which internalized defenses are utilized.—E. J. Kronenberger.

4535. Griswold, Paul M. & Dana, Richard H. (Kent State U.) **Feedback and experience effects on psychological reports and predictions of behavior.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 439-442.—This study, using groups that differed in training and conditions of feedback, involved comparisons made for accuracy and idiosyncrasy of data usage and for accuracy of predicting subsequent life events. Feedback, honest criticism, and support training conditions were utilized. Experienced Ss displayed less consensus on data usage, and employed more idiosyncratic adjectives and more idiosyncratic concepts. Some feedback implications are presented. It is suggested that clinical reports should adhere to behavioral data and minimize jargon. (20 ref.)—E. J. Kronenberger.

4536. Gurland, Barry J., et al. (New York State Dept. of Mental Hygiene, Biometrics Research, New York) **Cross-national study of diagnosis of mental disorders: Hospital diagnoses and hospital patients in New York and London.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 18-25.—Examined samples of patients from New York and London public mental hospitals to investigate the sources of the reported cross-national difference in the ratio of schizophrenia to affective disorder among hospital admissions. The primary source of this difference was that the hospital staffs in New York tend to diagnose all kinds of patients (excluding alcoholics, drug addicts, and patients with organic disorders) as schizophrenic, whereas in London some kinds of patients are diagnosed mainly as schizophrenic and others mainly as affective disorder.—*Journal summary.*

4537. Hall, Leon P. & La Driere, M. La Verne. (Oakland Schools, Pontiac, Mich.) **Evaluation of WISC similarities responses according to cognitive style and error analysis: A comparative study.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 175-180.—Matched 80 emotionally disturbed and 80 neurologically impaired boys in a public school setting for WISC Full Scale IQ and CA. An analysis was made of the Similarities subtest responses utilizing both the error-analysis method of J. T. Spence and the cognitive style procedure of I. E. Sigel for purposes of comparison. The Wilcoxon matched-pairs signed-ranks technique was used in analyzing the data. Results show that: (a) the error analysis approach

provided the greater potential for differential diagnosis between the 2 groups; (b) use of the cognitive style scores permitted improved definition of the dynamic implications of the error-analysis categories, inadequate abstracting and narrative-descriptive responses; and (c) diagnostic power was not increased when all responses as opposed to errors alone were considered.—*Journal abstract.*

4538. Heninger, George R., et al. (Yale U., Medical School) **A Short Clinical Rating scale for use by nursing personnel: II. Reliability, validity, and application.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 241-248.—Assessed the use of the 13-item Short Clinical Rating scale (SCRS) by 14 registered nurses, 3 licensed practical nurses, and 11 psychiatric aides on a short-term treatment and research ward for reliability and validity during a 6-mo period. The percent agreement and intraclass correlation coefficients for paired ratings reached an acceptable level. Although the same staff rated the Ward Behavior Rating scale (WBRS) more reliably than the SCRS, WBRS factors were less valid than SCRS items as assessed by correlations with a psychiatrist's ratings with the Brief Psychiatric Rating scale. The SCRS demonstrated specific objective biochemical validity since only anxiety ratings correlated significantly to serum free fatty acid concentrations. Applications of the scale are discussed. It is concluded that nursing ratings on the SCRS are reliable, valid, and useful. (18 ref.)—*Journal summary.*

4539. Irving, G., Robinson, R. A., & McAdam, W. (Crichton Royal, Dumfries, Scotland) **The validity of some cognitive tests in the diagnosis of dementia.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 149-156.—"Describes an attempt to assess the validity of a number of cognitive tests in distinguishing between brain-damaged and non brain-damaged psychiatric patients over the age of 65 yr." Validity of previously reported measures is supported in comparison of diagnosis and EEG classification with test scores. Progressive Matrices, face-hand test, "names" learning test, and orientation test discriminated functional and organic patients well enough to warrant clinical application.—R. L. Sulzer.

4540. Kear-Colwell, J. J. (Crichton Royal, Dumfries, Scotland) **The B factor scale of the 16 PF as a measure of intelligence in psychiatric patients.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 477-479.—The Standard Progressive Matrices, the Mill Hill Vocabulary Scale, and the 16 PF were administered to 210 psychiatric patients. The B factor scale of the 16 PF was found to be a reasonably valid measure of general intelligence in the female sample but for the male sample it seemed to be a measure of both verbal ability and general intelligence.—E. J. Kronenberger.

4541. Lacks, Patricia B., Colbert, John, Harrow, Martin, & Levine, Jacob. (Malcolm Bliss Mental Health Center, St. Louis, Mo.) **Further evidence concerning the diagnostic accuracy of the Halstead organic test battery.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 480-481.—The Halstead Battery of Neuropsychological Tests and the Bender-Gestalt were administered to 19 organic, 27 schizophrenic, and 18 general medical patients. The results substantiated previous research in that the Halstead battery had little value as a general measure to separate organic from nonorganic patients. Findings indicate that there was a very frequent misclassification of schizophrenics. The Bender-Gestalt

was more effective in classifying nonorganic patients than was the Halstead.—E. J. Kronenberger.

4542. Lacks, Patricia B. & Keefe, Kathryn. (Malcolm Bliss Mental Health Center, St. Louis, Mo.) **Relationships among education, the MMPI, and WAIS measures of psychopathology.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 468-470.—Investigated the relationship between 4 WAIS indices of interest variability (discrepancy between Verbal and Performance IQs, Verbal subtest scatter, Performance subtest scatter, and scatter within all 11 WAIS subtests), 2 measures of psychopathology in the MMPI (raw F and the number of clinical scales falling above T score of 69), and education in psychiatric patients. Inconsistent relationships are noted, a replication resulted in negative findings, and it is suggested that further pursuit of the WAIS-MMPI relationship might be fruitless.—E. J. Kronenberger.

4543. Liendo, Ernesto C. **Un modelo de ficha clínica psicoanalítica basado en la concepción del mundo interno como un sistema de signos.** [A model of a psychoanalytic clinical card index based on the conception of the inner world as a system of signs.] *Revista de Psicoanálisis*, 1969(Oct), Vol. 26(4), 865-919.—Proposes a therapeutic plan based on the construction of an index of psychoanalytic systematization of the personality which would permit more efficient and economical therapy and establish units of clinical understanding of the patient. After introducing the concept of structure, a semiological interpretation of Klein and Freud is discussed to clarify the concept of a binary inner world and of the organization of the defense system as a series of fixed codes. Suggestions are made for a concrete card index system, with the example of a binary table with 2 lists representing manifestations of opposite and complementary roles, e.g., the repressor and the repressed. These represented the 2 basic positions or identifications of the patient's inner world. A structural analysis of a 1st interview verifies the use of the model. It is shown that systematization orients a strategy of reintroduction. (French & English summaries) (43 ref.)—P. Hertzberg.

4544. Melrose, J. Peter; Stroebel, Charles F., & Glueck, Bernard C. (Inst. of Living, Hartford, Conn.) **Diagnosis of psychopathology using stepwise multiple discriminant analysis: I. Comprehensive Psychiatry**, 1970(Jan), Vol. 11(1), 43-50.—Current and Past Pathology Scales (CAPPS) data on 413 psychiatric patients were analyzed by stepwise discriminant analysis to obtain numeric models for 14 diagnostic categories, as described in the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders*. These models were then used to classify 255 new cases from the same source, and the results were compared with diagnoses made by clinicians and by DIAGNO II (a logical decision tree type of computer analysis). Using the kappa statistic as a basis for comparison, discriminant analysis first choice diagnoses agreed with clinical diagnoses about half as well as DIAGNO II and slightly better than DIAGNO II when 2nd and 3rd choice discriminant analysis diagnoses were allowed. The potential usefulness of the discriminant analysis in clinical practice is discussed.—*Journal summary.*

4545. Osborne, David. (Mayo Clinic, Rochester, Minn.) **A moderator variable approach to MMPI validity.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 486-490.—MMPI profiles were divided, on the

basis of the judgments of clinical psychologists, into a group that yielded relatively accurate predictions (hits) and a group that yielded relatively inaccurate predictions (misses) by comparing the MMPI interpretation to the admission note. A cross-validation sample was also utilized along with an item analysis. There was a good agreement between the judges in the accuracy of their MMPI interpretations. 38 MMPI items discriminated between the hits and the misses of the developmental sample at the .05 level and was called the moderator scale. An analysis of this scale indicated that it identified a source of error in the MMPI not identified by Scales L, F, and K and that this scale might be used as a new validity scale for the MMPI. A cutoff score of 21 was used but a local population cutoff score was suggested.—E. J. Kronenberger.

4546. Paulson, Morris J. & Lin, Tien-teh. (U. California, Center for the Health Sciences, Los Angeles) **Predicting WAIS IQ from Shipley-Hartford scores.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 453-461.—219 psychiatric patients completed the full Shipley-Hartford and the WAIS. IQ data were analyzed, correlation matrices derived, and regression equations calculated. Extensive data are presented including a table of estimated WAIS Full Scale IQ from Shipley-Hartford total raw score by age levels. Tabular data, comparing the results of other studies, are presented. The importance of considering age and education as important variables in measuring intelligence was noted. Sex was not a significant variable in this study. It was noted that valid estimates of WAIS IQ can be obtained from the Shipley-Hartford total raw score. (17 ref.)—E. J. Kronenberger.

4547. Platman, S. R. & Weinstein, Bette. (State U. New York, Downstate Medical Center, Brooklyn) **The diagnosis game.** *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 561-566.—Investigated the efficiency of a computer program DIAGNO, in diagnosing 156 manic-depressive patients in a research metabolic unit. Standard psychological variables, including the MMPI, and structured diagnostic interviews were used as measures. Data indicate that the computer program was able to categorize patient populations into nonsick, neurotic, and psychotic groupings. Limitations included difficulties in identifying a longitudinal disorder (e.g., manic-depressive psychosis). It is noted that of the 33 Ss in the manic phase, who "classically use denial and lying as a defense," 12 were diagnosed by the computer as not sick. A diagnosis of manic-depressive, manic phase, would require that S show both agitation and elation. It is concluded that DIAGNO is completely reliable from the point of view that "when given the raw data describing an S, a computer program will always arrive at the same diagnosis." Problems occur, however, concerning retest reliability, preconceived theoretical concepts, reliability between raters, and within the standardized interview.—P. McMillan.

4548. Plutchik, R., Platman, S. R., Tilles, R., & Fieve, R. R. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Construction and evaluation of a test for measuring mania and depression.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 499-503.—A list of 200 brief descriptive phrases, believed to be characteristic of things that manic or depressed patients say or do, was developed. These items were judged by 5 staff members and those items showing complete agreement were selected for the 1st version of a mania-depression scale.

The scale was administered to patients, and an item analysis found 16 items which discriminated the manic from the normal state and 46 items which discriminated the depressed from the normal. Reliability was noted as high.—E. J. Kronenberger.

4549. Rosenzweig, Stanley P. & Harford, Thomas. (Veterans Administration Outpatient Clinic, Boston, Mass.) **Correlates of the Psychotic Reaction Profile in an outpatient psychiatric sample.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 244-247.—Examined the correlates of the Psychotic Reaction Profile with a number of other psychological measures. Ratings on the Profile were obtained on 73 male psychiatric patients participating in a day treatment program in an outpatient clinic. Additional measures were obtained for this population on the WAIS, Holtzman Inkblot Test, Stroop Color-Word Test, and the Vineland Social Maturity scale. Findings indicate that Ss who rated high on thinking disorganization evidenced intellectual deficits, perceptual impairment, and a lower level of maturity. Ss who rated high on paranoid belligerence showed less perceptual distractibility and evidenced a higher level of social maturity. The 2 scales also differed with respect to the criterion of discharge disposition.—*Journal abstract*.

4550. Siskind, George. (Larue D. Carter Memorial Hosp., Indianapolis, Ind.) **Selected Designs: Note on further research.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 317-318.—Describes additional research with the Selected Designs, a screening device for detection of cerebral dysfunction, and reports results for 52 psychiatric inpatient adolescents and for nonpatient adults over 61 yr. of age. It is suggested that the test be used with caution on these 2 S populations.—*Journal abstract*.

4551. Sletten, Ivan W., Ernhart, Claire B., & Ulett, George A. (U. Missouri, Medical School) **The Missouri Automated Mental Status Examination: Development, use, and reliability.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 315-327.—Describes the development and use of the automated Missouri Mental Status (MMS) examination, and reports a study concerned with the reliability of its items and scales and the reliability of the psychiatric diagnosis made at the time of completion of the examination. MMS scale scores will be used in combination with data from other instruments to generate automated statistically developed statements regarding the probability of various important outcomes, e.g., response to treatment, return to social usefulness, or the possibility of suicide or assaultive behavior. (29 ref.)—D. Prager.

4552. Sopchak, Andrew L. (Onondaga County Child Guidance Center, Syracuse, N.Y.) **Anxiety Indicators on the Draw-a-Person Test for clinic and nonclinic boys and their parents.** *Journal of Psychology*, 1970(Nov), Vol. 76(2), 251-260.—After matching 20 control families with 20 families coming to the Child Guidance Center, they were given the Draw-a-Person Test. The tests were scored for 20 anxiety indices according to Handler's technique. The hypotheses that children and parents in the clinic group would show significantly more anxiety than the control group were supported. A significant relationship between the child and parental anxiety level was also found.—*Author abstract*.

4553. Thorne, Frederick C. (4 Conant Square, Brandon, Vt.) **Diagnostic classification and nomenclature for existential state reactions.** *Journal of*

Clinical Psychology, 1970(Oct), Vol. 26(4), 403-420.—Presents a new diagnostic classification and nomenclature for existential disorders, and the rationale, theory, nature, etc., of the problem. The source of the data came from the collection and evaluation of existential problems and disorders, from introspection with subjective reporting of existential concerns, and by questioning the person. "Expanding Frankl's concept of the existential (noogenic) neuroses," 12 existential states are differentiated: actualization states, conflict reactions, cultural double-bind reactions, and frustration, fatigue, inversion, demoralization, vacuum, satiation, alienation, disintegration, and self-transcendence states.—E. J. Kronenberger.

4554. **Weitbrecht, H. J.** *Psychiatrische Fehldiagnosen in der Allgemeinpraxis: Fibel der Differentialdiagnostik*. [Psychiatric misdiagnoses in general practice: Fundamentals of differential diagnosis.] Stuttgart, W. Germany: Georg Thieme, 1966. 251 p.—Eschewing theoretical exposition, attention is focused on the preclusion of mistakes in clinical practice resulting from overemphasis on theory in medical training. For this reason, a complete exposition of differential diagnosis in psychiatry is avoided, restricting discussion to a number of syndromes which tend to be more frequently encountered in ambulatory practice.—I. D. London.

BEHAVIOR DISORDER

4555. **D'Ambrosio, Richard.** (Long Island U.) *No language but a cry*. Garden City, N.Y.: Doubleday, 1970. 252 p. \$6.95.

4556. **Gary, A. L. & Hammond, R.** (Northwest Mississippi Regional Mental Health Center, Oxford) *Self-disclosures of alcoholics and drug addicts*. *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 142-143.—Describes a test of reciprocity, hypothesizing that "in the exchange of answers to personal questions, people tend to give answers of the same intimacy value as they get." Ss were 36 24-59 yr. old alcoholic and drug-addicted hospitalized patients. 10 sets of questions, scaled in intimacy from 1-7, from the M. W. Worthy, A. L. Gary, and G. Kahn study of self-disclosure, were used. Results indicate (a) strong support for the principle of reciprocity; and (b) Ss were highly in favor of the technique, as being less threatening than group therapy. The use of this method in promoting openness among patients is discussed.—P. McMillan.

4557. **Gil, David G.** (Brandeis U.) *Violence against children: Physical child abuse in the United States*. Cambridge, Mass.: Harvard U. Press, 1970. x, 204 p. \$6.50.

4558. **Hauser, Charles E.** (Washington U., Medical School) *Clinical correlates of sociopathy in childhood*. *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 558-560.—Presents a psychoanalytic, social, and developmental model to conceptualize sociopathy. Sociopathy is described as the development of a characterological style including (a) need-gratifying relationships, (b) basic mistrust or viewing the world as in opposition to one's needs, (c) inadequate separation-individuation, (d) lack of mutuality in interpersonal relationships due to both ego and superego defects, and (e) lack of internalization of societal structure. A case is presented to illustrate deficient primary narcissism, exaggerated infantile omnipotence, fixation at an oral or

need-gratifying level of relationships, and poor impulse control. A family history of deficient mothering capacities is also assembled from the data. It is suggested that the fringes of society, especially the disorganized lower class family, engenders sociopathic behavior and supplies the facade of compliance to mask it. An understanding of the development of this disorder will aid clinical diagnosis during childhood as effectively as in early adulthood.—*Journal summary*.

Drug Addiction

4559. (Geneva, Switzerland) **WHO expert committee on drug dependence**. *World Health Organization, Technical Report Series*, 1969, No. 407, 3-28.—Reviews the definition, evaluation, and criteria for control of drug dependence and abuse; the work of international bodies concerned with drug dependence; and "the abuse and control of drugs not under international control." The effects and incidence of abuse of cannabis, coca leaves, and cocaine, methadone maintenance, and specific opiate antagonists in therapy are examined. Standardization of clinical records is emphasized in the evaluation of treatment programs. The coordination of efforts to improve, coordinate, and evaluate educational materials and activities, and to provide retrieval systems for data on all aspects of drug abuse and related dependence" is discussed.—G. Steele.

4560. **Fracchia, John; Sheppard, Charles; Merlis, Michael, & Merlis, Sidney.** (Central Islip State Hosp., N.Y.) *Atypical reasoning errors in sociopathic, paranoid, and schizotypic personality types*. *Journal of Psychology*, 1970(Sep), Vol. 76(1), 91-95.—Raven Progressive Matrices (RPM) errors for 90 narcotic addicts divided into 4 MMPI profile types, primary sociopathic (49"), secondary sociopathic (42"), paranoid (428"), and schizophrenic (987") were scored for "atypicality" as defined by an item analysis. The finding that significantly more atypical errors were made by Ss showing psychotic-like profiles than by Ss manifesting sociopathic-like patterns was interpreted as indicating RPM performance indices are capable of reflecting the degree of organization of reasoning processes.—*Author abstract*.

4561. **Perkins, Marvin E. & Bloch, Harriet I.** (Beth Israel Medical Center, Morris J. Bernstein Inst., New York, N.Y.) *Survey of a methadone maintenance treatment program*. *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1389-1396.—Developed a comprehensive body of data on heroin addicts who apply to the methadone maintenance program and on patients admitted to Morris J. Bernstein Institute (MJB I). 4 interrelated studies were accomplished over a 3-yr period with 521 patients. The 1st study showed that the typical MJB I S was male, white, 32 yr. old, and Catholic. Also "Achieved Status" was low, "criminal-legal involvement" was high, "substance use" was extensive, and "health" was good. Throughout the program, the average S was maintained on 91-100 mg. of methadone/day. The 2nd study showed that discharge seemed to be linked with poor social and health functioning. The highest percentages of discharges were among the unemployed, criminally involved multiple substance users, and physically and mentally ill. The 3rd study showed that a significantly higher proportion continued drug use among those in the program 1 yr. or less. The 4th study was concerned with the differences among Ss admitted

to MJB1 and those who were not (i.e., more whites than nonwhites were admitted, admitted Ss were more often employed, etc.).—P. R. Shibelski.

4562. Reinert, R. E. (Veterans Administration Hosp., Topeka, Kan.) **General observations on drug habituation.** *Bulletin of the Menninger Clinic*, 1970(Jul), Vol. 34(4), 195-204.—Attempted to develop the thesis that the regular, i.e., addictive or habitual, use of many pharmacologically unrelated substances is basically the same phenomenon, i.e., the induction of an artificial desire or need which on examination turns out to be the withdrawal discomfort, the removal of which is the source of satisfaction. Despite great differences relating to the prevalence of a given substance or its pharmacology or its legality, the purpose for use of the substance by man has certain common denominators.—*Journal summary*.

Alcoholism

4563. Blume, Sheila B. (Central Islip State Hosp., N.Y.) **Driving histories of alcoholics in a treatment unit.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 734-743.—Examined the driving histories and attitudes toward driving and drinking in 46 male and 46 female nonpsychotic alcoholics who were voluntary patients in a state hospital rehabilitation program. 87% of the males and 61% of the females were or had been drivers. 63% of the drivers admitted they had been responsible for 1 or more accidents while driving under the influence of alcohol. All expressed disapproval of driving after drinking. A driver rehabilitation program for alcoholics would be more effective if combined with referral for full-scale treatment for the alcoholism. The driver rehabilitation program alone would not materially influence the course of the drinking.—D. Prager.

4564. Cahn, Sidney. **The treatment of alcoholics: An evaluative study.** New York, N.Y.: Oxford U. Press, 1970. viii, 246 p. \$7.50.

4565. Gillespie, Cecelia. (Colorado Nurses Assn., Denver) **Nurses help combat alcoholism.** *American Journal of Nursing*, 1969(Sep), Vol. 69(9), 1938-1941.—Describes involvement on the part of nurses in alcoholism programs. It is suggested that in addition to research and care of alcoholics, nurses can be used to a great extent in planning detoxification centers in motivating attitude changes of the public, in parole programs, and in inservice education programs.—B. A. Stanton.

4566. Groden, Gerald. (Purdue U.) **The performance of alcoholics on the Hidden Figures and the Trail Making tests.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 394.

4567. Hoffmann, Helmut. (Minnesota State Hosp., Willmar) **Depression and defensiveness in self-descriptive moods of alcoholics.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 23-26.—Administered M-MPI Depression (D) scales, Social Desirability (SD) scales from Edwards and from Marlowe-Crowne (MC-SD), and a set of mood scales to 61 alcoholic patients. An elevation for D and MC-SD was found. Somatic depression did not correlate significantly with depression of the phenomenological transparent mood scales, but with mood scales indicating inertia. SD correlates considerably with all mood factors, but MC-SD only with some of them. Alcoholics were characterized as being depressive and defensive in terms of giving a high approval-seeking self-image but not deviant by following

socially desirable self-descriptions.—*Journal abstract*.

4568. Jimeno Valdés, A. & Lequerica, Julio. **Accidente psicótico en la reacción disulfiram-alcohol.** [Psychotic illness in the disulfiram-alcoholic reaction.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Jul), Vol. 28(3), 192-200.—Discusses literature on the reactions of alcoholics to disulfiram (antabuse) and relates it to the case of a 35-yr-old alcoholic male. Treatment followed the Stählin and Solms method, except that the S was administered a maintenance dose of 375 gm. of disulfiram/day. S was observed to have no significant somatic reaction to the drug. However, a hallucinatory-paranoid psychosis appeared after the S imbibed alcohol in conjunction with the drug treatment. These symptoms disappeared with chlorpromazine treatment. The final diagnosis of toxic psychosis with schizophrenic symptomatology was discussed in relation to the pathogenesis of mental illness. (English summary)—P. Hertzberg.

4569. Kish, George B. (Veterans Administration Hosp., Ft. Meade, S.D.) **Alcoholics' GATB and Shipley profiles and their interrelationships.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 482-484.—The General Aptitude Test Battery (GATB) and the Shipley-Hartford were administered to 71 male inpatient alcoholics. Correlations between the Shipley-Hartford and GATB scales are presented. The Shipley-Hartford did not show a predictive value in relation to the performance or perceptual parts of the GATB. General intelligence was most accurately predicted by the Shipley-Hartford total score. Clerical perception was closely related to 3 aspects of the Shipley-Hartford but not to the Verbal part of the test. The Shipley-Hartford was noted as being a fairly useful, quick estimate of the General, Verbal, and Neutral scales of the GATB.—E. J. Kronenberger.

4570. McNichol, Ronald W. (Arkansas Rehabilitation Service, Benton) **The treatment of delirium tremens and related states.** Springfield, Ill.: Charles C Thomas, 1970. xi, 145 p. \$8.

4571. Saint, E. G. (U. Queensland, Brisbane, Australia) **Alcohol and society.** *Medical Journal of Australia*, 1969(Jul), Vol. 2(2), 69-76.—Discusses the problem of alcoholism—"a public health problem of the greatest magnitude"—in a sociological context. Principle issues presented include: (a) the dearth of information on the clinical, metabolic, and sociological aspects of alcoholism; (b) the ambivalence of the law derivative of the apathetic view of society towards alcoholism; and (c) the educational and administrative preparation of young people to meet modern social and behavioral problems.—A. Berg.

4572. Santo-Domingo Carrasco, Joaquín. **Recientes avances en alcoholismo y toxicomanías.** [Recent advances in alcoholism and toxicomanías.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Apr), Vol. 28(2), 134-144.—Examines recent research, literature, and treatment programs from clinical and therapeutic viewpoints. Problems in the terminology and classification of alcoholic and toxicomanic disorders are considered, as are aspects of prevention. Suggestions are made for standardizing alcoholic cures and for integrating the patient's family and church in the cure. Epidemiological questions are considered from practical and theoretical viewpoints. (32 ref.)—P. Hertzberg.

4573. Wilkinson, Patricia; Horvath, Thomas B., Santamaria, Joseph N., & Rankin, James G. (U.

Melbourne, St. Vincent's Hosp., Victoria, Australia) **Bromism in association with alcoholism: A report of five cases.** *Medical Journal of Australia*, 1969(Jun), Vol. 1(26), 1352-1355.—Alcoholics are particularly prone to bromureide habituation and intoxication. Unless suspected, bromism may be misdiagnosed, for its clinical features are variable and can mimic other neuropsychiatric disorders, including alcoholism. 5 alcoholic patients are described who developed chronic bromide intoxication after ingesting proprietary bromureide preparations which were available without prescription. Clinical analysis of the Ss' serum bromide levels varied from 193-290 mg/100 ml (24.1-36.3 mEq/l). All Ss manifested marked neuropsychiatric disturbances which, in the 4 patients who were treated, disappeared as the serum bromide level fell. 1 S also had a visual defect possibly attributable to bromide intoxication, but the defect did not improve with treatment. The need for awareness of this condition in alcoholics, and the magnitude of the hazard of bromism are stressed. (21 ref.)—*Journal summary.*

4574. **Wilkinson, Patricia; Santamaria, Joseph N., Rankin, James G., & Martin, Doris.** (U. Melbourne, Victoria, Australia) **Epidemiology of alcoholism: Social data and drinking patterns of a sample of Australian alcoholics.** *Medical Journal of Australia*, 1969(May), Vol. 1(20), 1020-1025.—Reviewed the case histories of 220 alcoholic patients, with attention focused on factors which might influence the development of physical complications of alcoholism. Ss were from all socioeconomic groups, and the majority working and living with their families before coming to the clinic. There were 4 times as many men as women. Characteristically, both male and female alcoholics were habitual excessive beer drinkers. The men consumed an average of 220 gm. of ethanol/day, and the women 155 gm. of alcohol/day. Most of the men started to drink regularly in their late teens, began to drink excessively in the middle or late 20s, and came to the clinic in their early 40s. The women started to drink later and drank excessively for a shorter period before seeking help. Results support the contention that alcoholism is a considerable public health problem in Australia, affecting all levels of the community. (18 ref.)—*Journal summary.*

4575. **Wilkinson, Rupert.** (U. Sussex, England) **The prevention of drinking problems: Alcohol control and cultural influences.** New York, N.Y.: Oxford U. Press, 1970. xv, 301 p. \$10.

Suicide

4576. **Braucht, G. Nicholas & Wilson, Lowell T.** (U. Colorado) **Predictive utility of the Revised Suicide Potential Scale.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 426.—Data were drawn from 63 fatal suicides, 324 nonfatal suicide attempters, and 95 nonsuicidal controls. The Revised Suicide Potential Scale (RSPS) correctly predicted 68.4% of the nonsuicidal group and misclassified 31.6% as suicidal. It is felt that the use of the RSPS is considerably useful where higher suicidal base rates are common, e.g., hospitals, crisis clinics, and suicide prevention services. —*M. West.*

4577. **Hill, Mary N.** (Smith Coll., School for Social Work) **Suicidal behavior in adolescents and its relationship to the lack of parental empathy. Dis-**

sertation Abstracts International, 1970(Jul), Vol. 31(1-A), 472.

4578. **Jourard, Sidney M.** **Suicide: An invitation to die.** *American Journal of Nursing*, 1970(Feb), Vol. 70(2), 269, 273-275.—Proposes that "a person destroys himself in response to an invitation originating from others that he stop living." Man begins to die when his life loses meaning, value, and hope. The ways in which persons in society contribute to the suicide of other persons are discussed.—*B. A. Stanton.*

4579. **Lester, David.** (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Factors affecting choice of method of suicide.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 437.—Examined the fantasy aggression of individuals choosing different methods of suicide. No significant differences on TAT themes were found between persons using active or passive methods of suicide.—*E. J. Kronenberger.*

4580. **Lester, David.** (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Social disorganization and completed suicide.** *Social Psychiatry*, 1970(Jul), Vol. 5(3), 175-176.—Found in Edinburgh, Scotland that the incidence of suicide is very common in areas of the city where there is a high degree of social disorganization, i.e., overcrowding and juvenile delinquency. A study in the city of Buffalo in the United States failed to replicate this finding. It appears possible, therefore, that the suicides (at least as determined by ecological studies) may differ considerably in Edinburgh and in Buffalo. Implications of this study are important since preventative measures for suicide would have to differ for the 2 countries if this were true. Overcoming social disorganization would be expected, e.g., to have an ameliorative effect on suicidal behavior in Edinburgh but not in Buffalo.—*Journal abstract.*

4581. **McCulloch, J. W. & Philip, Allstair E.** (U. Bradford, School of Applied Social Studies, England) **The social prognosis of persons who attempt suicide.** *Social Psychiatry*, 1970(Jul), Vol. 5(3), 177-182.—Discusses the social prognosis of persons admitted to hospital following a suicidal attempt. Relationships between demographic, clinical, and precipitating factors and social change, in the cases of 511 patients, were assessed by a psychiatric social worker 4 mo. after S's release from hospital. Younger Ss, those with extant marriages, fair work records, or living at home had social improvement more often than others. The prognoses for Ss who cut, strangled, or attempted to suffocate themselves were poor, and for those employing salicylates the prognoses were good. Where psychiatric disturbance was present at the time of the attempt, the social prognosis depended on alleviation of the illness. Ss with no psychiatric illness and those with character disorders alone, had more social problems and a poor social prognosis. Immediate precipitants of the suicide attempt were not related to social change; however, longstanding precipitants were felt to be possibly predictive of future behavior. Changes in the behavior of persons important to Ss were related to social change. The most important relationship was between improvement in Ss' behavior and social state. Results are discussed with relation to information available on similar patients from the same parent population. (French & German abstracts) (15 ref.)—*Journal abstract.*

4582. **Noyes, Russell.** (U. Iowa) **Shall we prevent suicide?** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 361-370.—Examines the role of the psychiatrist in the

effectiveness of suicide prevention programs with regard to such questions as: (a) why the psychiatrist became involved, (b) how he can justify his role in suicide prevention, (c) how effective can he be, and (d) what effect the interpretation of suicide as a sign of mental illness has had on the conceptualization of this act. It is concluded that even a massive prevention program cannot approach the impact of political and social forces beyond human control, and that in asserting these objectives, psychiatry "risks erosion of professionalism" and "renders itself increasingly ineffective in prevention efforts through its alliance with society." It is further suggested that the "theoretical impasse" between a psychiatrist's duty to his patient and to society demands, in actual practice, that the psychiatrist's actions in discharging his responsibility "be guided by an awareness of this conflict and the impingement of ethical values on his profession." (26 ref.)—*M. Maney.*

4583. Paul, Louis. (11665 W. Olympic Blvd., Los Angeles, Calif.) **The suicidal self.** *Psychotherapy: Theory, Research & Practice*, 1970(Fal), Vol. 7(3), 177-180.—Postulates the concept of suicidal self as a "subself" of a person which can on occasion "emerge as the dominant agency and preempt the person." Therapeutically oriented interviews with about 50 suicidal Ss (with actual attempts or contemplation of suicide) were reported. A Gestalt therapy approach was used which sought to make the S aware of and remove the suicidal self. It is suggested that the suicidal self is a type of "cruel inner critic" which is "hostilely monitoring and directing the person to fail." An example is given of how this inner critic may be confronted and dealt with effectively.—*P. McMillan.*

4584. Wilkins, James. (U. Toronto, Centre of Criminology, Ontario, Canada) **Suicide prevention centers: Comparisons of clients in several cities.**, 1969(Nov), Vol. 10(6), 443-451.—Presents data from the Chicago Call for Help Clinic and compares it with data from other centers, e.g., Melbourne, London, Miami, Los Angeles, Boston, etc. Centers in the larger cities receive more than enough calls to keep their staffs occupied. The oldest and best known centers receive about 1 call each hr. At least 60% of the calls are directly related to suicide with the remainder given to other or potentially pre-suicidal problems. About 2/3 of the callers are female and about 1/2 of the callers are in their 20s or 30s. Repeat or chronic callers are 4% of the total in Los Angeles and considerably less elsewhere. There is remarkable similarity in the experiences of centers in different cities. "They thrive and perform a valuable community service in a wide variety of situations. Additional comparative research would be beneficial. (24 ref.)—*D. Prager.*

Crime

4585. Brown, Barry S. (Dept. of Corrections, Washington, D.C.) **The impact of imprisonment on selected attitudes of recidivists and first offenders.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 435-436.—Investigated the impact of the prison experience on the attitudes toward the legal establishment and attitudes regarding aggression. 4 groups of male offenders (1st offenders: 40 incarcerated 1 wk. or less, 46, 11-18 mo.; recidivists: 40 incarcerated 1 wk. or less, 47, 11-18 mo.) were administered the Mylonas Law Scale and the Buss-Durkee Inventory. Newly arrived inmates showed significantly higher guilt scores. Recidivists

showed less favorable attitudes toward law and law enforcement, greater negativism toward others, and tended to be more suspicious, more prone to assaultiveness and felt less guilt.—*E. J. Kronenberger.*

4586. Cowden, James E., Pacht, Asher R., & Bodemer, Ottmar A. (Wisconsin Dept. of Health & Social Services, Madison) **The 16 PF vs. the MCI in a group testing program of reformatory inmates.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 510-513.—168 male reformatory inmates were administered the 16 PF and the Minnesota Counseling Inventory (MCI). Each inmate was rated on a number of variables by a psychologist with no knowledge of the inmate or the test results. The E and the G scales consistently differentiated among the various subgroups in the direction of predicting a poor adjustment within the institution. In general, the 16 PF showed a slight but consistent superiority over the MCI for their overall efficiency in differentiating among the various subgroups.—*E. J. Kronenberger.*

4587. Goldfarb, Ronald L. & Singer, Linda R. **Maryland's defective delinquency law and the Patuxent Institution.** *Bulletin of the Menninger Clinic*, 1970(Jul), Vol. 34(4), 223-235.—The Patuxent Institution in Maryland serves as a diagnostic center for prisoners to be adjudged as "defective delinquents," and then carries on a rehabilitation program for such prisoners. The Institution is considered 1 of the rare examples of prison administration in which the collaborative efforts of psychiatrists, psychologists, and social workers are utilized to maximize rehabilitation results and minimize recidivism.—*J. Z. Elias.*

4588. Golubov, Sv. L. **Psikhopatiya i prestuplenie.** [Psychopathy and crime.] Sofia, Bulgaria: Meditsini i Fiskultura, 1967. 235 p.—A monograph (a publication of the series *Selecta Medica*) on (a) the criminal behavior of psychopaths, (b) the systematics of the psychopathies, and (c) "the connection between the forms of personality anomalies and the crimes committed." The notion that "each psychopath has his own psychopathy" and that it is, therefore, impossible to produce a scientific classification of the psychopathies is rejected. In this connection, it is suggested that, instead of psychological or sociological criteria, variants of physiological types be utilized. The author is, furthermore, opposed to the facile application of the concept of "diminished responsibility" to the criminal psychopath and suggests instead a careful case by case determination of responsibility in meting out punishment and prescribing treatment.—*I. D. London.*

4589. Koller, K. M. & Castanos, J. N. (St. George Hosp., Kogarah, New South Wales, Australia) **Parental deprivation and attempted suicide in prison populations.** *Medical Journal of Australia*, 1969(Apr), Vol. 1(17), 858-861.—Examined short-term male, long-term male, and short-term female prisoners in 2 separate jails. A history of attempted suicide from a prison population is common. Each of the groups of male prisoners disclosed an incidence of 12%, the female prisoners 36%. Statistical comparisons between those prisoners with and without a history of attempted suicide revealed that the prisoners who attempted suicide had a greater likelihood of parental deprivation. This loss concerned both parents for a variety of reasons, and the environment subsequent to the loss was of no apparent relevance. Prisoners who had experienced parental loss at 10-15 yr. old and who were also the youngest children in the family were

particularly vulnerable to suicide. In a prison population, there appear to be distinct groups who are suicide prone. The psychopathological condition of these suicide-prone individuals appears to be distinctively different from that of their closely matched fellows with no such history. Certain theoretical issues in relation to the etiology of attempted suicide in general are discussed, and some comparisons are made with a psychiatric group attending a general hospital unit.—*Journal summary.*

4590. Lindner, Lewis A., Goldman, Harold; Dinitz, Simon, & Allen, Harry E. (Ohio State U., Medical School) **Antisocial personality type with cardiac liability.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 260-267.—Describes an experiment in a state penitentiary involving 19 primary sociopaths, 10 mixed, and 14 nonsociopaths, as defined by clinical, psychometric, and criminal history criteria. Results indicate that the primary sociopaths were not homogeneous with regard to such variables as previous antisocial history, family characteristics, psychological profiles, and attitudes. Using the Lykken scale scores as criterion, primary sociopaths were divided into 2 types, hostile and simple, who differed significantly on nearly all socio-cultural and psychological measures. Only the simple (reasonably nonaggressive) sociopaths demonstrated the cardiac liability to epinephrine previously ascribed to sociopaths in general. Findings were consistent with other physiologic observations on skin and pupil responses. Both the unusual physiology and behavior of the simple sociopath may be manifestations of a single autonomic defect, reflecting diminished function of catecholamine secreting neurons, including those involved with sensory input. (25 ref.)—*Journal summary.*

4591. Lunden, Walter A. (Iowa State U.) **Staff turnover and tenure in the British prison service.** *Correctional Psychologist*, 1968(Sep), Vol. 3(6), 2-10.—Reasons for the low turnover (7.4%) and long tenure (42% more than 11 yr., 57% more than 6 yr.) are given as: (a) recruitment and selection techniques; (b) education and training of officers; (c) a strong prison officer's association; (d) free flow of communication between administration and staff; (e) a favorable balance between the central division, regional division, and local institution; and (f) a favorable social image of the Civil Service employees.—*R. V. Hamilton.*

4592. Manne, Sigmund H. (Patuxent Inst., Jessup, Md.) **The relationship between institutional treatment and parole.** *Correctional Psychologist*, 1969(Jan), Vol. 3(7), 23-25.—The program at the Patuxent Institution, which attempts to utilize the concepts of mental health and forensic medicine in the area of crime and delinquency and staffed and directed by psychiatrists and the psychiatric team of psychologists and social workers was compared with the penal system of 2 autonomous correctional institutional treatment programs and the parole system. It is hoped that there will evolve a closer working relationship and consistency of treatment inside and outside of correctional institutions.—*R. V. Hamilton.*

4593. Martin, Paul L. & Barry, John R. (U. Chicago) **A prediction of recidivism.** *Correctional Psychologist*, 1969(Jan), Vol. 3(7), 6-13.—An intensive review indicated a mean recidivism rate within a 33-55% range. The rate of return to crime appears to be related to numerous pre- and postprison variables. Low socioeconomic status, marital instability, low educational status, and poor home environment seem to be highly prognostic of criminality. (46 ref.)—*R. V. Hamilton.*

4594. O'Neil, Carle F. & Travisano, A. P. **Correctional chemotherapy.** *Correctional Psychologist*, 1969(Jan), Vol. 3(7), 26-31.—In a questionnaire to 132 responding training schools, 93 indicated use of psychiatric medication for inmates. Of the 93 respondents, 53 indicated the primary use of the medication was a combination of control and treatment; 33 indicated the purpose was as an adjunct to other forms of programming; and 7 indicated the purpose was for maintaining control. None of the respondents reported the use of medication for punishment. Comments indicated a wide divergence of opinion regarding the use of medication for correctional programs.—*R. V. Hamilton.*

4595. Reay, Donald T. & Hazelwood, Robert R. (U.S. Armed Forces Inst. of Pathology, Washington, D.C.) **Death in military police custody and confinement.** *Military Medicine*, 1970(Sep), Vol. 135(9), 765-771.—The death rate of prisoners in custody or confinement in a military setting was found to be 1/22,000, including deaths by suicide, homicide, or accident. The most common method of suicide is by hanging. Almost 50% of the suicides occurred within the 1st few hours after arrest, the prisoner being intoxicated in all cases. No deaths from natural causes were reported and may be attributed to the youthfulness of the prisoners who were, with few exceptions, in the lowest 2 pay grades.—*G. A. Clum.*

4596. Resnick, Phillip J. (Case Western Reserve U., Medical School) **Murder of the newborn: A psychiatric review of neonaticide.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1414-1420.—Explored the differences in the killing of a newborn infant from that of other filicides. A new term, "neonaticide," is proposed for this phenomenon. Mothers who commit neonaticide are less frequently psychotic than mothers who kill older children. Whereas most filicides are committed for "altruistic" reasons, most neonaticides are carried out simply because the child is unwanted. Reasons for neonaticide include extramarital paternity, rape, and seeing the child as an obstacle to parental ambition. Illegitimacy is the most common motive. There are 2 groups of unmarried murderesses: (a) those who are young, immature, and passive to sexual relations (often deny pregnancy and rarely premeditate murder); and (b) those who have strong instinctual drives and little ethical restraint (tend to be older, more callous, and often promiscuous). It is speculated that unresolved oedipal feelings may contribute to some neonaticides that have previously been attributed to entirely sociological factors. (51 ref.)—*P. R. Shibleski.*

4597. Rosenblatt, Gerald F. & Hannum, Thomas E. (Iowa State U.) **Relationship between Machiavellianism and sociopathy in an incarcerated female population.** *Correctional Psychologist*, 1969(Jan), Vol. 3(7), 16-22.—41 female prisoners were measured for Machiavellian orientation by means of the Mach IV Scale, Mach V Scale, Coalition-Triad game, and peer and self-ratings; and for tendencies for sociopathy by means of selected MMPI scales, Lykken scale, certainty-judgments by the institutional psychologists, and biographical data. There was no consistent significant relationship between the concepts of Machiavellianism and sociopathy as these concepts were defined and measured in this study.—*R. V. Hamilton.*

4598. Scott, George D. **The prisoner of society: Psychiatric syndromes in captive society.** *Correctional Psychologist*, 1969(Jan), Vol. 3(7), 3-5.—Presents short descriptions of a variety of psychiatric syndromes

(related to penitentiary terminology): (a) the initial admission trauma, "admission fog," is characterized as seclusiveness, conversational disinterest, bland obedience, and physical lethargy; (b) "coasting," an acceptance of the status quo of prison life produces self-imposed and protective isolation from outside; (c) "gate fever-short time jitters," refers to the separation anxiety pending return to society; (d) "lock-up request-crisis request" is a prison phenomenon where the inmate no longer can control of impending hostility and needs isolation to reestablish self-control; (e) "isolation sickness" is the psychological reaction to deprivation of accustomed sensory input; (f) "stir crazy" is a reaction to confinement and is a regression to childish, silly, petulant behavior; (g) "slashing syndrome" a form of self-mutilation designed for attention-getting value; (h) "phantom female" syndrome refers to pseudoheterosexual attachment for a female surrogate in a fellow inmate; and (i) "homosexual panic" refers to the anxiety reaction to the inmate's reaction to his own strong homosexual desires.—R. V. Hamilton.

Juvenile Delinquency

4599. Borkovec, Thomas D. (U. Iowa) **Autonomic reactivity to sensory stimulation in psychopathic, neurotic, and normal juvenile delinquents.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 217-222.—To test the hypothesis that lowered reactivity and/or more rapid adaptation to sensory inputs is a primary characteristic in psychopaths, 19 psychopathic, 21 neurotic, and 26 normal juvenile delinquents were identified by a behavior checklist and were presented with 21 successive tone stimuli while skin conductance and heart rate (HR) were being monitored. Results indicate that psychopaths gave significantly lower GSRs to the initial stimulus and lower, though not significantly lower, HR changes and prestimulus to poststimulus basal skin conductance increases. Skin conductance levels during rest and stimulation periods were not significantly different. It is concluded that the psychopathic autonomic characteristic resides in lower initial reactivity and not in more rapid adaptation, at least in response to a simple auditory stimulus. (18 ref.)—*Journal abstract.*

4600. Davenport, Christopher M. (Boston Coll.) **A study of the feasibility of developing a delinquent girl scale for the School Interest Inventory.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 215.

4601. Masters, John C. (U. Minnesota, Inst. of Child Development) **Treatment of "adolescent rebellion" by the reconstrual of stimuli.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 213-216.—Presents the thesis that a viable therapeutic procedure might involve discussion and behavior assignments designed to alter the extent to which a client feels he controls his environment. A case study is presented in which an adolescent was encouraged to construe his obedient behavior as an active and successful attempt on his part to control the behavior of his parents, rather than as a meek submission to their demands. Behavior in assignments demonstrated that behavior which was in accord with his parents' requests did exert control over their privilege-granting behavior.—*Journal abstract.*

4602. Monahan, Thomas P. (Villanova U.) **Police dispositions of juvenile offenders: The problem of**

measurement and a study of Philadelphia data. *Phylon*, 1970(Sum), Vol. 31(2), 129-141.—Discusses the problem of collecting and evaluating data about law-violating behavior and presents juvenile findings for Philadelphia from 1955-1966. Many urban area police reports are of negligible scientific value. "They would be much more meaningful if careful explanations of the method of assembly of the data and their fluctuations were given, and if definition of the units of count (especially 'contacts') and other terms were clearly specified, as they are not now, and strictly followed."—A. R. Howard.

4603. Rothenberg, Eugenia. (U. New Mexico) **The effect of self-disclosure and pseudo-self-disclosure on social adjustment of institutionalized delinquent girls.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5246.

4604. Werle, Michael E. (Boston U., School of Education) **The effects of anxiety and reward on the cheating behavior of incarcerated juvenile delinquents.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 169-170.

4605. Zimmeroff, Steven J. (U. Mississippi) **Behavior and modification with delinquents.** *Correctional Psychologist*, 1968(Sep), Vol. 3(6), 11-25.—A review of the limited literature concerning techniques of behavior modification used with delinquents revealed: (a) theoretical implications of learning principles and delinquent, antisocial behavior; (b) techniques for modification of delinquent behavior outside of the institutions; and (c) behavior modification with incarcerated delinquents. (16 ref.)—R. V. Hamilton.

Homosexuality & Sexual Deviation

4606. Bentler, P. M. & Prince, Charles. (U. California, Los Angeles) **Psychiatric symptomatology in transvestites.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 434-435.—The Differential Personality Inventory was administered to 176 transvestites and 74 control Ss. A linear discriminant function analysis was carried out. Results indicate that the 2 groups differed only slightly and that no gross differences were noted between transvestites and controls on neurotic or psychotic scales.—E. J. Kronenberger.

4607. Cowden, James E. & Morse, Edwin L. (Wisconsin Dept. of Health & Social Services, Madison) **The relationship of defensiveness to responses on the Sex Inventory.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 505-509.—The MMPI and the Sex Inventory were administered to 189 sex offenders and the results were analyzed to assess the influence of defensiveness upon Sex Inventory scale scores. A correlation analysis yielded various results. Defensiveness, as measured by the K scale of the MMPI, was not related significantly to the admission or denial of sexual maladjustment, loss of sex controls, or homosexuality. Maximally accurate discriminations could be made between subtypes of sex offenders who scored high on the MMPI F scale and/or low on the L scale. "In spite of significant correlations between these MMPI scales and the Sex Inventory scales, using the former as moderators did not increase the accuracy with which Ss could be classified into subtypes."—E. J. Kronenberger.

4608. Hoenig, J., Kenna, J., & Youd, Ann. (Memorial U., St. John's, Newfoundland, Canada) **Social and**

economic aspects of transsexualism. *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 163-172.—Social, economic, and educational factors are emphasized in describing an untreated group of 60 persons, each of whom felt that inwardly he was really a member of the opposite sex. The syndrome was generally well established by age 19, sexual propensity was mostly homosexual, unrealistic expectations of a complete sex change operation were held, there was a high incidence of male prostitution, and social maladjustment was shown in the high percentage of antisocial and criminal behavior. None of the women remained married, but surprisingly 1/2 of the marriages by men survived, despite cross-dressing and attempts to have sex-change operations. (19 ref.)—R. L. Sulzer.

4609. Lihn, Henry. (435 N. Roxbury Dr., Beverly Hills, Calif.) **Fetishism: A case report.** *International Journal of Psycho-Analysis*, 1970(Aug), Vol. 51(3), 351-358.—Describes the case history of a male with a ladies' panty fetish from his start in therapy through his marriage and fatherhood. (22 ref.)—J. S. Chyatte.

4610. Wallace, Leon. **Psychotherapy of a male homosexual.** *Psychoanalytic Review*, 1969, Vol. 56(3), 346-364.—A 34-yr-old male homosexual began treatment because of depression associated with inability to achieve a lasting homosexual relationship. After 88 hr. of psychotherapy in 8 1/2 mo., the patient achieved a heterosexual image of himself and shortly afterwards was married. His homosexual activity was a defense against threat of psychic dissolution known to exist in relatively compensated schizophrenics.—D. Prager.

MENTAL DISORDER

4611. Atkinson, Roland M. (U. California, Medical School, Los Angeles) **Coast Guard psychiatric inpatients: Assessment, management and disposition.** *Military Medicine*, 1970(Sep), Vol. 135(9), 772-778.—Coast Guard personnel who become psychiatric patients are likely to be young and have little elapsed service time. A diagnosis of personality disorder is established in 50% of the cases. Only 6% of this subgroup was returned to duty. In contrast, patients in other diagnostic groups were returned to duty at a 45% rate.—G. A. Clum.

4612. Bagley, Christopher & Evan-Wong, Louise. (U. Sussex, Centre for Social Research, Brighton, England) **Psychiatric disorder and adult and peer group rejection of the child's name.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1970(May), Vol. 11(1), 19-27.—Compared the names (1st name and surname) of 83 children attending a child guidance clinic with the names of 83 nonpsychiatric controls. The names were presented in randomly ordered pairs to a group of adult judges, and in projective sociometric situations to 2 groups of 11-yr-old children, and to a group of 7 yr. olds. Results indicate that the names of Ss are significantly more often rejected as odd or unpleasant than the names of controls, and that it is the oddity of the child's surname that accounts for this difference. Findings are interpreted in terms of the child's self-image, and in terms of symbolic interaction theory. A study of the 19 Ss with the most frequently rejected names shows that they have significantly fewer possible etiological factors than the remainder of the Ss, suggesting that the oddity of the child's name, and subsequent disturbed interaction of the child with his peers, can be of singular importance

in the etiology of psychiatric disorder. (18 ref.)—*Journal summary*.

4613. Bazzoui, Widad. (U. Missouri) **Affective disorders in Iraq.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 195-203.—Clinical study of 98 Iraqi patients showed less incidence of ideas of unworthiness and fewer suicidal thoughts than would be expected in a similar group of affective disorders in England. In depression there seemed to be less sadness, and in mania patients lacked the infective joyous mood of Western profiles. Physical symptomatology and hysterical behavior conspicuously colored depression while paranoid thinking and projection were common. Mania, conversely, was characterized by aggression and more antisocial behavior than in the West. Cultural influences and child rearing may explain differences in personality structure. (27 ref.)—R. L. Sulzer.

4614. Chatel, John C. & Peele, Roger. (St. Elizabeths Hosp., Washington, D.C.) **A centennial review of neurasthenia.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1404-1413.—Traces the history of the term "neurasthenia" to its supposed origination and to its originator, George Miller Beard. During the decades subsequent to its origination and up until the early 20th century the term found widespread use and took on many varying meanings and interpretations. Until recently, however, the term was considered virtually obsolete in the United States although some European nations retained the term. With the development of a new classification of mental disorders for the 8th Revision of the *International Classification of Diseases* the term returned. The varying definitions, the genogenic, chemogenic, and psychogenic explanations of the term, a clinical description, and a history of treatment of the disorder are presented. A brief discussion of the term by George Mora follows. (98 ref.)—P. R. Shibleski.

4615. Grisso, J. Thomas. (Ashland Coll.) **Verbal behavior and the action-thought dimension.** *Journal of Abnormal Psychology*, 1970(Oct), Vol. 76(2), 265-269.—2 studies investigated verbal indexes of action- and thought-oriented behavior styles proposed by L. Phillips and E. Zigler (see PA, Vol. 36:4JP37P), and employed a method for assigning verbs in TAT stories to thought, action, or being categories. Ss manifesting thought-oriented response tendencies were expected to produce a greater percentage of thought-related verbs, and a smaller percentage of action-related verbs, than were Ss manifesting action orientations. Ss were 60 male psychiatric patients (Study I) and 90 undergraduates (Study II). Action-thought independent variables were symptom form among patients and verbal aptitude among students. Results support the manifestation of action and thought behavior styles in verbal behavior, but require revisions in thought verb criteria. Difficulties concerning interpretations of styles are discussed.—*Journal abstract*.

4616. Hare, Robert D. (U. British Columbia, Vancouver, Canada) **Psychopathy: Theory and research.** New York, N.Y.: John Wiley, 1970. x, 138 p. \$5(cloth), \$2.95(paper).

4617. Huber, G. (Ed.) **Schizophrenie und Zyklothymie: Ergebnisse und Probleme.** [Schizophrenia and cyclothymia: Results and problems.] Stuttgart, W. Germany: Georg Thieme, 1969. 204 p.—Presents a collection of 22 articles by West German, Austrian, Swiss, and Norwegian authors on the current state of theory concerning the endogenic psychoses, and

the various problems encountered in schizophrenia and the affective psychoses.—J. D. London.

4618. Jacobs, Theodore J. & Charles, Edward. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Correlation of psychiatric symptomatology and the menstrual cycle in an outpatient population.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1504-1508.—Studied the menstrual histories of 200 patients at a New York hospital center who were seen over a 6-mo period in an attempt to correlate psychiatric symptomatology and the menstrual cycle. It was found that the menstrual period, the premenstrual phase, and midcycle intervals were the times when most psychiatric contact was made. Because for such patients menstruation serves as a monthly stress, under circumstances of increased psychological vulnerability, a serious decompensation can precipitate. It is stressed that the psychiatrist should not overlook this possibility and should intercede in a preventive manner either by scheduling more appointments on or around the time of expected period or by increasing medication at this time.—P. R. Shibelski.

4619. Kraus, J. **The relationship of psychiatric diagnoses, hospital admission rates, and size and age structure of immigrant groups.** *Medical Journal of Australia*, 1969(Jul), Vol. 2(2), 91-95.—Admission rates for patients with schizophrenia and paranoid states were found to be consistently higher for immigrants to Australia (except those from the United Kingdom and Greece) than for the native population. There was a significant inverse correlation between admission rates and the size of the groups, and a positive correlation between admission rates and the proportion of patients 20-54 yr. old in the groups. Admission rates for alcoholism and alcoholic psychosis were significantly higher for males born in the United Kingdom, New Zealand, and Poland than for Australians. Admission rates for depressive psychosis were higher for females born in the United Kingdom and males born in the Netherlands. Rates for neuroses and psychosomatic disorders were higher for all Yugoslav immigrants, for males born in New Zealand and Germany, and for females born in Hungary. Rates of admissions of patients with personality disorders were higher only among immigrants from New Zealand.—*Journal abstract*.

4620. Linsky, Arnold S. (U. New Hampshire) **Who shall be excluded: The influence of personal attributes in community reaction to the mentally ill.** *Social Psychiatry*, 1970(Jul), Vol. 5(3), 166-171.—Tests 3 hypotheses indicating that communities have a greater propensity to exclude for mental illness: (a) lower-class persons and members of low status racial-ethnic groups, (b) persons who lack close social ties in the community, and (c) mentally deviant males rather than females. Ss were 14,304 1st admissions to 3 state mental hospitals from 1957-1964. An exclusion index was used as a measure based on the ratio of voluntary to involuntary commitments to mental hospitals, with high ratios indicating high rejection or low community tolerance of deviance. All 3 hypotheses were supported. Findings have implications for current etiological theories of mental illness including the social isolation, socioeconomic deprivation, and sociocultural fit hypotheses. It is concluded that differential community reaction to mental deviance may contribute to the high incidence of hospitalized mental disorders among the groups discussed. (French & German abstracts) (25 ref.)—*Journal abstract*.

4621. Michaux, Mary H., Suziedelis, Antanas; Garmize, Karen, & Rossi, J. Antoinette. (Springfield State Hosp., Sykesville, Md.) **Depression factors in depressed and in heterogeneous in-patient samples.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1969(Dec), Vol. 32(6), 609-613.—Evaluated 158 newly hospitalized, functionally ill psychiatric patients on the Hamilton Rating Scale for Depression. Single item scores were intercorrelated; a centroid factor analysis and varimax rotation were completed. The resulting factors: insomnia, agitated depression, digestive disturbances, hypochondriasis, suicide, somatic symptoms, and retardation and apathy, were compared with factors reported by M. Hamilton (see PA, Vol. 35:6462), based on ratings on the same items of depressed male Ss. In diagnostically heterogeneous Ss, depression and guilt were associated with agitation rather than with retardation, as in depressed patients. Both specific physical symptoms and various types of sleep disturbances appeared in a more varied behavioral context in depressed than in heterogeneous Ss. In both samples, suicide was associated with depression and guilt but not with anxiety, agitation, or impairment. (23 ref.)—*Journal summary*.

4622. Rego, A. (Centro Neuropsiquiatrico de Martorell, Barcelona, Spain) **La apraxia del vestirse en las demencias seniles.** [Apraxia for dressing in senile dementia.] *Revista de Psiquiatria y Psicología Médica*, 1969(Oct), Vol. 9(4), 255-264.—Apraxia for dressing in cases of focal lesions differs from apraxia for dressing in cases of senile dementia. In the latter all higher functions are impaired, and the confusion between pieces of clothing and the appropriate body parts appears before asomatognosia sets in. Behavioral deterioration in senile dementia is broken down into 3 stages, their characteristics are described, and the changes in dressing and undressing oneself that take place in these stages are analyzed in terms of spatial relations and their conceptualization, the execution of temporal sequences of acts, and the relations between garments and parts of the body.—L. Zusne.

4623. Timsit, Martine, et al. (U. Liège, Belgium) **Variations contingentes négatives en psychiatrie.** [Contingent negative variation in psychiatry.] *Electroencephalography & Clinical Neurophysiology*, 1970(Jan), Vol. 28(1), 41-47.—Studied the contingent negative variation (CNV) in 45 normal, 70 neurotic, and 45 psychotic Ss. Correlations were sought between the amplitude and duration of the CNV and these clinical groups. The amplitude of the CNV had no statistically significant relationship with any of the 3 clinical groups, although, in the neurotic group, it was larger in obsessives than in hysterics. Regarding the duration of the CNV, a definite relationship existed between the diagnosis and the persistence of the negative wave after the imperative stimulus. The probability of the occurrence of a prolonged CNV increased with the severity of the psychic disturbance. Some explanatory hypotheses are proposed.—*English summary*.

Neurosis & Emotional Disorder

4625. Berg, Ian. (High Lands, Scalebor Park, Burley-in-Wharfedale, England) **A follow-up study of school**

phobic adolescents admitted to an in-patient unit. *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1970(May), Vol. 11(1), 37-47.—Described the in-patient management of 29 school phobic adolescents previously reported in I. Berg, K. Nickols, and C. Pritchard (see PA, Vol. 44:5369). A follow-up study was carried out about a yr. after 23 Ss were discharged from an adolescent unit. School (or employment) attendance, family adjustment, and friendships with other young people, were rated by a psychiatric social worker from information given by the mother, as either satisfactory or unsatisfactory. 21 discharged cases were reviewed after an average of 13 mo. Of the 27 Ss in which the outcome was known 16 were satisfactorily attending school or work. 9 were also well adjusted in relation to home and other young people. Of the 12 who attended a day school satisfactorily, 7 had made a satisfactory adjustment to both home and other young people. 11 were failures. Results are similar to previous follow-up studies in that a $1\frac{2}{3}$ of school phobic adolescents returned to school after treatment; about a $\frac{1}{3}$ of the cases were well adjusted on review, $\frac{1}{3}$ had limited functioning, and $\frac{1}{3}$ were severely incapacitated by neurotic problems and interpersonal difficulties. (27 ref.)—*Journal summary*.

4626. David, Henry P. (American Inst. for Research, Silver Spring, Md.) **Relevance of programs for emotionally disturbed youth in other lands.** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 203-209.—On behalf of the Joint Commission on Mental Health of Children, a survey of current trends was conducted in more than 40 countries. Focus was on organization and delivery of services and their relevance for evolving practices in the United States. Data indicate a divergence in attitude, a seemingly greater flexibility, and a willingness to experiment with administrative and therapeutic roles. It is suggested that ideological differences are important determinants of the organization, range, and quality of services provided. Statistics indicate that the American system of organization and delivery of care fails to meet current needs of a significant proportion of United States children. A more productive application of the experience of other countries is urged. (15 ref.)—*Journal abstract*.

4627. Davies, Brian. (U. Melbourne, Victoria, Australia) **Recent studies of severe depressive illnesses: I.** *Medical Journal of Australia*, 1969(Mar), Vol. 1(10), 487-491.—Describes "how in the 1950s, clinical observations on the action of certain drugs gave rise to theories about the biochemical basis" of severe depressive illnesses. Investigations of the 1960s are critically examined, and the classification and course of depressive illnesses are discussed. The effects of ECS, leucotomy, electrolytes, lithium, and endocrine functions on mood disorders are examined. Individual case studies are presented.—*G. Steele*.

4628. Giel, R. & van Luijk, J. N. (Psychiatric Clinic, Groningen, Netherlands) **Psychiatric morbidity in 50 juvenile delinquents in Addis Ababa.** *Social Psychiatry*, 1970(Jul), Vol. 5(3), 183-186.—Studied 50 juvenile delinquents in a training center and Ethiopian boys' home. Data reveal that psychiatrically disturbed children are found in such an institution, while they are conspicuously absent in outpatient populations. The broken family background of these Ss did not bear a clear relationship to the presence of psychiatric disorder and appeared to be a normal pattern of life in Ethiopia. (French & German abstracts)—*Journal abstract*.

4629. le Coultre, R. (74 Stadionskade, Holland, Netherlands) **Die Ichspaltung als zentrale Neuroseerscheinung.** [Splitting of the ego as the central phenomenon of neurosis.] *Psyche, Stuttgart*, 1970(Jun), Vol. 24(6), 405-422.—The neurotic conflict is not a simple conflict between id and ego. In reality it is a conflict within the ego sphere, between the principal ego and a split-off portion, each with its id qualities. The conflict between this "adult" ego and the "infantile" portion comprises the central structure of neurosis. The task of therapy is to resolve this split. Careful reading of Freud shows this formulation to be consistent with his views.—*E. W. Eng*.

4630. Neumärker, K. J. (Humboldt U., Berlin, E. Germany) **Zu dem Problem der Heredität bei Zwangsnerven.** [On the problem of heredity of obsession neuroses.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(May), Vol. 22(5), 185-190.—The extremely compulsive character of 30 obsessive neurotics were also found in preceding and succeeding generations of relatives. Cyclothymic or a low level depressive temperament is an essential element in the development of this disease. Obsessional neurosis is concluded to be always a simultaneity of a series of both endogenic and exogenic factors. (63 ref.)—*K. J. Hartman*.

4631. Seitz, Frank C. (Veterans Administration Hosp., Denver, Colo.) **Five psychological measures of neurotic depression: A correlation study.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 504-505.—30 neurotically depressed inpatients were administered 5 tests of depression. Correlations between the tests were quite high although some differences between tests were noted. Psychiatric estimates of depression did not correlate significantly with any of the paper-and-pencil measures of depression.—*E. J. Kronenberger*.

4632. Timsit, M. & Koninckx, N. (U. Liège, Belgium) **Approche statistique de corrélations entre données cliniques et données électroencéphalographiques dans les névroses.** [Statistical approach to correlations between clinical data and electroencephalographic data in neuroses.] *Acta Neurologica et Psychiatrica Belgica*, 1968(Oct), Vol. 68(10), 769-786.—Statistically significant correlations between different EEG patterns and clinical data were established in a population of 64 male and 84 female 25-45 yr. old neurotics. The double-blind method was used in interpreting EEG and clinical findings. Correlation of EEG variables with clinical values was facilitated by use of a computer. Results show "that beta rhythms, mu waves, and a slow frequency of the alpha rhythm seem to have only an indicative value in the diagnosis of neurosis. . . ." though "a mediocre blocking reaction, polyrhythmic recordings and recruitment by flicker probably have discriminative value in recognizing introversion and obsession; excess of theta activity, the alpha variant, auditory potentials, and posterior slow waves aid in recognizing hysteria and psychopathy. These results stress the interest of the study of EEG abnormalities in functional cases." (English & German summaries)—*T. N. Webster*.

Psychosis

4633. Arlow, Jacob & Brenner, Charles. (120 W. 59th St., New York, N.Y.) **La psicopatología de las psicosis: Una propuesta de revisión.** [The psychopathology of psychoses: A proposal of revision.] *Revista de Psicoanálisis*, 1969(Oct), Vol. 26(4), 921-942.—Ex-

tends psychoanalytic concepts of the formation of symptoms to the psychopathology of psychoses. Freudian concepts on neurosis are discussed regarding their application to psychoses and are believed to be more valid than older concepts. From the viewpoint of clinical observation, psychoanalytic theory is regarded with strict adherence to data from gained from actual experience. From the therapeutical viewpoint, a theory is suggested for treatment. It is noted that an analysis of the symptoms of psychosis results in a recognition of the functions of the ego and superego that are involved in the regressive process of defense. A method of reducing anxiety and mitigating the intensity of intrapsychic conflict is proposed. It was analogous to techniques used in treating neurotics and resulted in an increase in the egoistic functions of adaptation and integration. (4 p. ref.)—*P. Hertzberg.*

4634. **Ballak, Leopold; Hurvich, Marvin, & Crawford, Patrick. Psychotic egos.** *Psychoanalytic Review*, 1969-1970(Win), Vol. 56(4), 526-555.—A resume of analytic conceptions of the role of the ego in psychosis is followed by a list of 12 ego functions and some illustrations from ego function profiles of individual patients. Ego function profiles facilitate comparisons for differential diagnosis and planning of therapy and for charting therapeutic progress. Early recognition of etiology and pathogenesis should lead to more primary prevention and a significant decrease in the vast social problem psychoses present. A discussion by E. Menaker and a rebuttal by G. Blanck follow. (28 ref.)

4635. **Kahn, Roy M.** (1420 Addison St., Berkeley, Calif.) **Both horns of a dilemma are usually attached to the same bull: A built-in impediment to understanding psychoses.** *Perspectives in Biology & Medicine*, 1970(Sum), Vol. 13(4), 633-635.—Argues that psychosis is process and not state, and therefore is most appropriately investigated by a variety of disciplines (biochemistry, pharmacology, neurochemistry, systems theorists, etc.) other than psychiatry and psychology which have assumed the investigative and therapeutic roles. Psychosis, viewed as process, does away with concepts of "functional" or "organic."—*Author abstract.*

4636. **Lenz, Hermann.** (Krankenhaus der Barmherzigen Brüder, Linz/Donau, Austria) **Die noogene Psychose.** [The noogenic psychosis.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1969(Nov), Vol. 19(6), 241-249.—Based on the material provided by 225 histories, cases are sought in which an event from the spiritual, supra-individual sphere stands at the beginning of the psychosis. It was found that this occurred in only 6% of the cases. In these cases the configuration of the psychosis led to a breakdown of the ego at the confrontation of the noosphere or in the attempt to actualize and vivify this sphere in the ego. The noogenic psychosis is not described as a possible new cause of psychosis, but it is emphasized that it is 1 standpoint of consideration among many and that no single 1 of them may be assigned sole causal efficacy. (19 ref.)—*English summary.*

4637. **Müller-Hegemann, D.** (Wilhelm Griesinger Hosp., Berlin, W. Germany) **Über reaktive psychosen.** [On reactive psychoses.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(May), Vol. 22(5), 172-177.—Reviews 2 case histories of patients with reactive psychoses. 1 of the 2 cases had been previously diagnosed as paranoid psychosis. Differences among German, American, and Scandinavian psychiatrists

regarding the use of the classification of reactive psychosis are discussed. Need is expressed for a multidimensional scaling of organic, constitutional, and dispositional factors to facilitate diagnosis. (15 ref.)—*K. J. Hartman.*

4638. **Pasini, W. & Stockhammer, H.** (Gynecological Polyclinic, Geneva, Switzerland) **Deux cas de psychoses post-abortives.** [Two cases of postabortive psychosis.] *Annales Médico-Psychologiques*, 1970(Apr), Vol. 1(4), 555-564.—Reviews the literature concluding that psychotic manifestations following induced abortion are quite rare. 2 cases of decompensation following a legal and a criminal abortion are described. In line with these cases, the difficulty of establishing an univocal pathogenesis, the impossibility of foreseeing the sequelae of abortion, and the increased hazards of decompensation in prepsychotic personalities and in cases where induced abortion is experienced in a conflicting manner on the individual, family, or cultural level are discussed.—*T. N. Webster.*

4639. **Rassidakis, N. C., Kondakis, X., Papanastassiou, A., & Michalakeas, A.** (State Mental Hosp. of Athens, Daphni, Greece) **Withdrawal of antipsychotic drugs from chronic psychiatric patients.** *Bulletin of the Menninger Clinic*, 1970(Jul), Vol. 34(4), 216-222.—Tranquilizing drugs were instantaneously withdrawn from 43 chronic psychotic patients of both sexes for a 9-mo period. 25 (58.1%) of these relapsed at various intervals against 14 (34.1%) of the control group living under the same conditions and in the same hospital. No placebo was used. There was no withdrawal syndrome manifested in the experimental group. Of the variables studied, the age of the onset of illness in the case of schizophrenia and CA of all patients studied influence the phenomenon of relapse and its timing to a statistically significant level. The chronicity of the illness and the factor of occupation do not seem to influence relapses.—*Journal summary.*

4640. **Sachar, Edward J., Hellman, Leon; Fukushima, David K., & Gallagher, T. F.** (Montefiore Hosp. & Medical Center, New York, N.Y.) **Cortisol production in depressive illness: A clinical and biochemical clarification.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 289-298.—Measured cortisol production by isotopic methods in 16 54-75 yr. old depressed patients before and after recovery. 9 Ss showed elevated cortisol production rates during illness. Psychiatric assessments of 32 items of depressive symptomatology were also made. Change in cortisol production from illness to recovery correlated (.89, $p < .001$) with change in scores on items related to emotional arousal (anxiety and sadness) and psychotic disorganization. Apathetic depressed Ss showed little or no change in cortisol production, anxious Ss showed mild to moderate changes, and Ss undergoing acute psychotic decompensation showed very marked changes. In contrast, there was no correlation between cortisol production and scores for all other symptoms of depressive illness. It is concluded that adrenocortical activity in depressed patients is primarily related to dimensions of emotional arousal and psychotic disorganization rather than to depressive illness per se. It is suggested that measurements of cortisol production can aid in interpreting data gathered from other stress-sensitive biological systems in depressed patients. (23 ref.)—*Journal summary.*

4641. **Uszkewiczowa, L.** **Zaburzenia reaktywne i symulacja w praktyce sądowopsychiatrycznej.** [Re-

active disorders and simulation in forensic psychiatric practice.] Warsaw, Poland: State Publishing House of Medical Literature, 1966. 71 p.—Examines the problems posed by reactive psychoses, and the simulation of psychoses in forensic psychiatry.—*I. D. London.*

Schizophrenia

4642. Bellak, Leopold; Hurvich, Marvin; Gediman, Helen, & Crawford, Patricia J. (New York U.) **Study of ego functions in the schizophrenic syndrome.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 326-336.—Investigated differences between 50 hospitalized schizophrenics, 25 neurotics from an outpatient clinic, and 25 controls (hospital administrative personnel) with regard to level of adaptation of ego functions. Differentiating between subgroups of schizophrenics was also undertaken. 12 ego functions were investigated including, reality testing, judgment, regulation and control, object relations, thought processes, etc. Ratings were based on interviews, a battery of individual psychological tests, and 18 additional psychological laboratory procedures relevant to ego functioning. Results reveal highly significant differences in ego function mean scores between the 3 groups, with the schizophrenics obtaining the lowest scores. Illustrative diagnostic profiles for individual schizophrenic patients are presented and discussed.—*P. McMillan.*

4643. Brooks, Robert B. (Clark U.) **The response of normals and schizophrenics from elaborated and restricted language code backgrounds to verbal and nonverbal communication.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 407-408.

4644. Christozov, Christo. (Faculty of Medicine, Psychiatric Clinic, Sofia, Bulgaria) **La schizophrénie en Afrique du nord sous l'optique de la psychiatrie transculturelle.** [Schizophrenia in North Africa examined from the viewpoint of transcultural psychiatry.] *Annales Médico-Psychologiques*, 1970(Apr), Vol. 1(4), 521-554.—Studied 260 male Ss hospitalized in Morocco on individual, familial, and collective levels with respect to age, family status, number of offspring, occupation, residence characteristics, duration and number of hospitalizations, neurologic condition, and incidence of alcoholism, cannabism, and syphilis to examine how ethnic, cultural, and religious peculiarities of North African society mark the clinical picture and dynamism of schizophrenia. Paranoia, followed in importance by catatonia, is the predominant form, doubtlessly representing a fundamental characteristic of North African psychopathology. Other clinical characteristics, as well as prognosis, are discussed in relation to their counterparts in European countries. (22 ref.)—*T. N. Webster.*

4645. Conforto, C., Giberti, F., Rosenbaum, C. P., & Rossi, R. (U. Genoa, Italy) **Prepsychotic adjustment and outcome in Italian schizophrenic patients.** *Comprehensive Psychiatry*, 1969(Nov), Vol. 10(6), 492-497.—Results, agreeing with past literature, show a strong relationship between good premorbid adjustment and acute onset, and both of these are associated with good response to treatment. Data are based on a sample of 56 men and 44 women admitted to an inpatient service between 1962-1968 and diagnosed as schizophrenic. Nearly all simple, hebephrenic, and pseudo-neurotic patients showed a poor premorbid adjustment while paranoid and catatonics showed good premorbid adjustment. A vulnerable prepsychotic personality does

not seem to be related to deterioration in intellectual functioning.—*D. Prager.*

4646. Craig, Robert J. (Chicago State Hosp., Ill.) **Relationship between severity of illness and over-inclusive thinking in schizophrenia.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 251-254.—Tested 40 chronic schizophrenics on 3 measures of overinclusive thinking—Epstein's test, proverbs and the Object Sorting Test—and then rated them for severity of illness with the Psychotic Reaction Profile. Results show that severity of illness can be a significant source of variance in assessing schizophrenic thought disorder. Overinclusive thinking is not merely a trait evinced by schizophrenics irregardless of S variable or stimulus elements. Failure to consider these factors in research designs may obscure the results of potentially meaningful research.—*Journal abstract.*

4647. de Barros Ferreira, Mario. **Análise dos diferentes ciclos electroencefalograficos de sono de seis esquizofrenicos cronicos correlações poligraficas.** [Analysis of different electroencephalographic sleep cycles of six schizophrenics: Polygraphic correlations.] *Actas Luso-Espanolas de Neurologia y Psiquiatria*, 1968(Jul), Vol. 28(3), 215-238.—Recorded all night sleep in 6 chronic female schizophrenics for 9 consecutive nights. Ss were deprived of REM sleep from the 4th-7th night. Studies were made of the effect of the 1st night's sleep and the effect of REM deprivation on the dynamic organization of sleep cycles. Time of sleep onset, the latencies of muscle tone loss, the 1st REM period, and the 1st electrodermograms were considered. Findings show that traumatic or psychogenic external stimuli destroy the harmony of sleep. These disturbances resulted in an increase in the intermediate phase of sleep which is believed to be related to delirium. (French & English summaries) (23 ref.)—*P. Hertzberg.*

4648. Emmerich, David S. & Levine, Fredric M. (State U. New York, Stony Brook) **Differences in auditory sensitivity of chronic schizophrenic patients and normal controls determined by use of a forced-choice procedure.** *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 552-557.—Investigated whether chronic nondelusional schizophrenic patients (mean age 39.7 yr.) differed from normal controls (male undergraduates, mean age 17.6 yr.) in absolute auditory sensitivity. (It is noted that little change in auditory sensitivity occurs at the signal frequency used in this experiment between the ages of 17 and 40.) To control for motivational and attentional factors, a 2-interval, forced-choice procedure was used. The usual procedure was modified in several ways to minimize general schizophrenic performance deficit. Results indicate that schizophrenic Ss required 8 db. more signal intensity to achieve the same level of performance as did controls. (20 ref.)—*Journal summary.*

4649. Enachescu, C. (Marinescu Hosp., Bucarest, Romania) **Les broderies bizarres des schizophrènes et leur signification psychopathologique.** [Bizarre embroideries of schizophrenics and their psychopathological significance.] *Acta Neurologica et Psychiatrica Belgica*, 1968(Oct), Vol. 68(10), 729-740.—Bizarre embroideries of mental patients, as a form of psychoplastic expression of the morbid structure of their personalities, were rarely studied until recently. The embroideries of 2 female Ss, aged 35 and 50, who have made many such embroideries, were analyzed. The form and morbid content of the embroideries reflect the structure of their makers' personalities, delirium, and hallucinations.

(English & German summaries) (26 ref.).—T. N. Webster.

4650. Fa-yu, Cheng. **Reaction time of introverts vs. extroverts in schizophrenics and normals.** *Acta Psychologica Taiwanica*, 1968(Mar), Vol. 10, 45-51.—Theorized that schizophrenics should be generated from extroverted persons and their mental illness should be worse than that of introverted persons. 33 hospitalized schizophrenics were selected along with 40 students as the 2 polar extremes identified by the E score of the Maudsley Inventory Test. Every S made 15 trials of RT to the 3 tone stimulus intensities, 90, 60 and 30 db. Only the last 10 trials were calculated in the discussion. It was found that (a) the schizophrenics' RTs to the tone stimuli are as long as the normals' when the stimulus intensity decreases. This fact is not consistent with Venable's finding. (b) The RT of the introverted S is shorter than that of the extroverted I, but for the schizophrenic this relation is reversed. (c) An introverted person becomes significantly slower to react to out world stimuli when he becomes mentally ill than when he is healthy.—*Journal abstract*.

4651. Hoaken, Paul C. (Queen's U., Kingston, Ontario, Canada) **Monozygotic twins discordant for schizophrenia.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 612-621.—The study of monozygotic (MZ) twins discordant for schizophrenia can reveal important experiential factors in the development of at least some cases of schizophrenia. The gradual development of paranoid schizophrenia was described in an MZ male twin who later recovered completely from his illness. His life pattern was compared with that of his nonpsychotic co-twin, and his early characteristics and development were contrasted with features of schizophrenic twins in discordant pairs in a recently reported summary of cases. It is suggested that late onset paranoid schizophrenia is different in many ways from other subtypes of schizophrenia beginning in adolescence.—*Journal summary*.

4652. Koh, Soon D. & Shears, George. (Michael Reese Hosp., Inst. for Psychosomatic & Psychiatric Research & Training, Chicago, Ill.) **Psychophysical scaling by schizophrenics and normals: Line lengths and music preferences.** *Archives of General Psychiatry*, 1970(Sep), Vol. 23(3), 249-259.—119 schizophrenics and 56 normal Os judged lengths of lines and preferences for musical excerpts by category rating and magnitude estimation. In the scalings of music preferences, schizophrenic Ss were comparable to normals in their scale forms, inter-scale matching, and intergroup agreement, but their scale range was shortened and constrictive. Individual data showed poor internal consistency and heterogeneity for the schizophrenic Ss in the use of categories and numerals, which presumably accounts for the scale constriction. Data also revealed a high response polarization and perseveration, low average uncertainty, loose category and numeral boundaries, and constrictive use of magnitude. In the scaling of line lengths, such effects were not found, with the exceptions of the low internal consistency and constrictive use of numbers. Observations are related to theoretical formulations on schizophrenia, i.e., paradoxical sensitivity, associative disturbances, and response interferences. (32 ref.).—*Journal summary*.

4653. Laing, R. D. & Esterson, A. **Sanity, madness, and the family: Families of schizophrenics.** Baltimore, Md.: Pelican, 1970. 281 p. \$1.45(paper).

4654. May, Robert. (Austin Riggs Center, Stockbridge, Mass.) **Paranoia and power anxiety.** *Journal of*

Projective Techniques & Personality Assessment, 1970(Oct), Vol. 34(5), 412-418.—Presents a partial test of the theory that paranoid schizophrenia in men involves severe anxiety over aggression or assertion. Ss were men and women in 3 categories: paranoid schizophrenic (N = 14), nonparanoid schizophrenic (N = 23), and people without any history of psychiatric trouble (N = 43). Using a set of TAT cards portraying various situations of anger and aggression, it was found, as predicted, that only paranoid schizophrenic men showed a defensive response. Findings are discussed in the context of traditional gender roles and other evidence about the paranoid style. (26 ref.).—*Journal abstract*.

4655. Roth, Edna F. (Smith Coll., School for Social Work) **An exploratory study of the psychodynamics of mothers who have autistic children.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 474.

4656. Sluzki, Carlos E., et al. **Interaccion familiar y esquizofrenia: I. Simetria-complementaridad.** [Family interaction and schizophrenia: I. Symmetry-complementary.] *Acta Psiquiátrica y Psicológica de América Latina*, 1969(Dec), Vol. 15(4), 309-323.—Examines the results of an investigation which is studying the interaction among families consisting of a mother, father, and schizophrenic adolescent. 6 S families and 5 control families (with no mental illness) were interviewed and given a questionnaire which revealed mother-child, father-child, and mother-father coalitions in both S and control families. Examination of the characteristics particular to each type of coalition revealed a predominance of symmetry and less of a power struggle in the S families. This was attributed to different rules of adaptive behavior. The purpose of the analysis was to illustrate an empirical method for investigating the interrelations between familial and schizophrenic interaction. (English summary)—P. Hertzberg.

4657. Soriano Ortega, Manuel C. (Valencia Medical School, Spain) **Posible manifestación bioquímica de la esquizofrenia.** [Possible biochemical manifestation of schizophrenia.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Jul), Vol. 28(3), 201-207.—Discusses the literature pertaining to the discoveries that: (a) serotonin is a biological amine existing in the blood serum, platelets, and brain; (b) bufotenin produces psychotic effects; and (c) bufotenin is a biological derivative of serotonin. An incomplete experiment is described in which the blood serum of Ss with various types of schizophrenia and normal controls was collected. From these, in vitro applications of MAO inhibitors were made to destroy the serotonin so that the presence of bufotenin could be detected. The R_p of 10,000 mg. of pure serotonin, bufotenin, and of blood serum treated with serotonin was obtained. Further investigation will be conducted with the expectation of finding that serotonin is transformed into bufotenin exclusively in the blood serum of schizophrenics. (16 ref.).—P. Hertzberg.

4658. Truscott, Ida P. (Rollman Psychiatric Inst., Cincinnati, O.) **Contextual constraint and schizophrenic language.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 189-194.—Compared 16 hospitalized schizophrenic patients and 16 non-psychiatric patients for the degree of facilitation of contextual constraint in memory. Ss were matched for intelligence, age, education, duration of illness, and socioeconomic level. All Ss listened to 4 taped word passages of different linguistic structure: normal and

anomalous sentences, and semantically related and random word-strings. Ss differed in recall on all conditions, with the greatest difference between S groups occurring on normal sentences. Both S groups showed greater recall on passages emphasizing semantic components than on those with syntactic. Results suggest that the schizophrenic difficulty in communication may be influenced by lack of memory facilitation due to contextual constraints. (24 ref.)—*Journal abstract.*

Schizophrenia Treatment

4659. Angst, Z. **Die somatische Therapie der Schizophrenie.** [Somatic therapy of schizophrenia.] Stuttgart, W. Germany: Georg Thieme, 1969.—With the exception of electroshock therapy and psychosurgery, the book is wholly concerned with the medicinal treatment of schizophrenia and reflects the worldwide literature on the subject.—*I. D. London.*

4660. Boyer, L. Bryce. (3021 Telegraph Ave., Berkeley, Calif.) **La técnica psicoanalítica en el tratamiento de ciertos trastornos caracterológicos y esquizofrénicos.** [Psychoanalytic technique in the treatment of certain characterological and schizophrenic disorders.] *Revista de Psicoanálisis*, 1969(Oct), Vol. 26(4), 765-812.—Presents the clinical history and a description of the therapeutic technique in the treatment of a 25-yr-old female schizophrenic with visual trauma involving sensations of blackness in the head and the formation of a figurative halo. This was considered to be a variety of Greenacre's vision, headache, and halo syndrome, with identical defensive and adaptive designs, the analysis of which was essential for therapy. Based on the case and other research, the treatment of certain characterological, schizophrenic, and schizoaffective disorders is discussed. Problems of diagnosis are considered. (English & French summaries) (4 p. ref.)—*P. Hertzberg.*

4661. Claghorn, James & Schoolar, Joseph C. (Baylor U., Medical School, Houston, Tex.) **The behavioral pharmacology of oxypertine.** *Journal of Clinical Pharmacology & the Journal of New Drugs*, 1970(May), Vol. 10(3), 203-206.—Reports a double-blind study of the efficacy of oxypertine (OXY) and chlorpromazine (CPZ) (thorazine, minor tranquilizer) on 40 male schizophrenics, 19-64 yr. old, with a mean age of 33.5 yr. Ss were divided into 2 groups of 20 based on a matching of the Nurses Observation scale for Inpatient Evaluation and the Brief Psychiatric Rating scale. The treatment period was 12 wk., and it was found that a therapeutically effective response was gained from 300 mg. daily of OXY and 800 mg. daily of CPZ. OXY was found to be "an active antipsychotic medication with a mg. potency 2½ times as great as that of CPZ." Side effects occurred in both groups, but slightly more in the CPZ Ss. The sedative properties of CPZ caused more improvement in anxiety and thought disorder, but a deterioration of personal appearance and increased retardation. OXY improved social interest, emotional withdrawal, and blunted effect, but had a higher dropout rate and lesser effects on thought disorder.—*P. Hertzberg.*

4662. Skoda, C., Nestlingerová, E., & Nestarcová, K. (Psychiatric Research Inst., Prague, Czechoslovakia) **Retention rates of schizophrenia: A comparison of shock therapy and psychopharmacological eras and of closed and open door policies.** *Social Psychiatry*,

1970(Jul), Vol. 5(3), 172-174.—Compared the retention rates of cohorts of schizophrenic patients admitted to a regional mental hospital at different hospital treatment periods, using neurotic patients as controls. Results indicate that retention rates were (a) maximal in schizophrenic patients in the shock treatment period with a closed door policy, (b) minimal during the period of psychopharmacotherapy with the open door policy, (c) distributed between both extremes during the period of psychopharmacotherapy with the closed door policy, and (d) slightly elevated corresponding to the marked decrease of bed utilization during the open door system. In females an interesting but nonsignificant reversal of the trend found for males was observed in the 1st 3 mo. of stay. The relation of the subsequent retention rates was similar to that of the male samples, though the only significant difference between cohorts was of greater retention during the closed than the open door period when psychotropic drugs were used. The effect on the cohorts of the factors mentioned, and their homogeneity in respect to sex, age, and clinical diagnosis, was demonstrated. (French & German abstract)—*Journal abstract.*

4663. Turek, I. S., et al. (Maryland State Psychiatric Research Center, Baltimore) **The use of molindone in the treatment of acute psychotic states: Comparison of two dosage schedules.** *Journal of Clinical Pharmacology & the Journal of New Drugs*, 1970(Sep), Vol. 10(5), 349-355.—Molindone (EN-1733-A), a new indole derivative (3-ethyl-6,7-dihydro-2-methyl-5-morpholino-methylindole-4(5H)-one hydrochloride), was tested for 6 wk. in 38 newly hospitalized schizophrenics using 2 dosage schedules—fixed and escalating. Moderate neuroleptic effects were noted and the drug was well tolerated. Principal side effects were postural hypotension and mild extrapyramidal symptoms.—*E. M. Uprichard.*

4664. Wolpert, A., et al. (Central Islip State Hosp., N.Y.) **Clinical pharmacological trial of loxapine succinate.** *Journal of Clinical Pharmacology & the Journal of New Drugs*, 1970(May), Vol. 10(3), 175-181.—Describes a preliminary study to obtain evidence of antipsychotic activity, dosage range, and safety of loxapine succinate (CL 71,563). Tests were conducted at 4 drug evaluation units and Ss included (a) 6 28-44 yr. old chronic male schizophrenics; (b) 22-54 yr. old chronic schizophrenics (7 males and 6 females); (c) 10 9-26 yr. old female schizophrenics; and (d) 12 24-48 yr. old male schizophrenics, respectively. Dosage ranged from 40-200 mg. daily, but the most appropriate dosage was believed to be between 40-100 mg. Clinical improvement was noted in all studies, and CL 71,563 was reported to be an active neuroleptic. Consistencies were found in psychiatrists' global assessments of improvement and in the Nurse's Observation Scale for Inpatient Evaluation. Extrapyramidal symptoms were the most common side effect and 23 Ss received antiparkinsonian agents.—*P. Hertzberg.*

PSYCHOSOMATIC DISORDER

4665. Eiff, A. W., Kloska, G., & Quint, H. (Eds.) **Essentielle Hypertonie: Klinik, Psychophysiologie und Psychopathologie.** [Essential hypertension: Clinical picture, psychophysiology and psychopathology.] Stuttgart, W. Germany: Georg Thieme, 1967. 232

p.—Presents a collection of articles exploring primarily the psychosomatic aspect of hypertension—the most frequently encountered “specifically human affliction.” The contributors include physiologists, therapists, ophthalmologists, psychologists, and psychoanalysts (Freudian and Jungian).—*I. D. London.*

4666. Resh, Mary G. (Veterans Administration Hosp., Denver Colo.) **Asthma of unknown origin as a psychological group.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 429.—Data from 30 adolescent and adult asthmatics suggest “that patients with asthma of unknown origin are psychologically different from asthmatics whose illness can be demonstrated to have an allergic basis.” It is suggested that psychosomatic groups may be psychologically heterogeneous.—*M. West.*

4667. Vidal Teixidor, R. & Ruiz-Ogara, C. J. (U. Barcelona, Spain) **Factores sociofamiliares influyentes en los trastornos psicósomáticos.** [Socio-familial factors influencing psychosomatic disturbances.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Jul), Vol. 28(3), 208-214.—Examines the influence of intrafamilial dynamics on psychosomatic illness. 14 psychosomatically ill Ss, 7 organically ill controls, and 4 neurotic controls, were administered the following: (a) the SN 59 test to examine the Ss' grades of neuroticism and sincerity; (b) the Bell Questionnaire to examine the Ss' familial, emotional, social, and vocational adaptation; and (c) the TAT. The clinical history of all Ss was studied and their families were interviewed. It was found that the psychosomatic Ss tended to negate conflicting familial situations, whereas neurotic and organically ill Ss treated them openly. The initial hypothesis that the family structure and relationship is related to the appearance and duration of illness in psychosomatic Ss was confirmed.—*P. Hertzberg.*

CASE HISTORY

4668. Adams, George L., Kivowitz, Julian, & Ziskind, Eugene. (Harvard Medical School, Lab. of Community Psychiatry, Boston, Mass.) **Manic depressive psychosis, mental retardation, and chromosomal rearrangement.** *Archives of General Psychiatry*, 1970(Oct), Vol. 23(4), 305-309.—Presents the case of an 18-yr-old female patient hospitalized with findings of moderate mental retardation (WAIS full range IQ of 60) and manic depressive psychosis. Chromosome studies suggested a complex rearrangement of karyotypes not found in either parent or in S's only sibling. Pertinent literature is reviewed concerning the effect of inheritance or chromosomal abnormalities on this kind of disorder. It is concluded that chromosomal rearrangement has not yet been established as responsible for mental retardation or affective psychosis in such patients.—*P. McMillan.*

4669. Allende, Rafael P. (U. Chile, Cátedra de Psiquiatría, Santiago) **Biographische Perspektiven der Schizophrenie in der Zwillingsforschung.** [Biographic perspectives of schizophrenia in twin research.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967, Vol. 15(3-4), 351-361.—Presents a biographic case of the physiological and emotional development of 1 pair of male, identical twins from birth to the age of 17. 1 twin was diagnosed as having hebephrenic paranoid schizophrenia at the age of 17. The emotional significance of “being a twin” and intrapair

differences were investigated in an attempt to isolate a causative factor.—*B. A. Stanton.*

4670. Cristodorescu, D. & Alexandru, S. **Disogenezia gonadală pură din punct de vedere psihiatric.** [Pure gonadal dysgenesis from the psychiatric viewpoint.] *Neurologia, Psihiatria, Neurochirurgia*, 1968(Mar), Vol. 13(2), 125-130.—Reports on a patient with an asthenic personality (manifestation of an endocrine psychosyndrome) and depressive reactional disturbances. Characteristics of the psychostressing situation in which such individuals find themselves, owing to their condition, and the deficient way in which their psychosexual identity is construed, are discussed. (French, German, & Russian summaries) (16 ref.).—*English summary.*

4671. DeVillez, Richard L. & Ellis, George J. (Fitzsimons General Hosp., Denver, Colo.) **Male Turner's syndrome: A case report with normal external genitalia, hormonal assays and secondary sex characteristics.** *Military Medicine*, 1970(Sep), Vol. 135(9), 786-790.—Describes an unusual case of male Turner's syndrome. Features normally found in Turner's syndrome were present, i.e., short stature, webbed neck, cubitus valgus, low hair line, shield chest, and pectus excavatum. The patient did not demonstrate congenital heart disease, retarded skeletal growth, or mental deficiency, and had normal penile and testes size. There were normal karyotype and hormone function, thus supporting the hypothesis that there is a range of phenotypic expression, depending on the degree of sex chromosome deficiency between XY and XO.—*G. A. Clum.*

4672. Greenberg, Harvey R. **Transactions of a hair-pulling symbiosis.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 662-674.—Presents a case of trichotillomania in a 15-yr-old female. The symptom occurred in the context of a mother-daughter relationship characterized by mutual dependence, ambivalence, and provocation. The transactions of this hair-pulling symbiosis are described and analyzed.—*Journal summary.*

4673. Klee, Gerald D. (Temple U., Health Sciences Center) **Marihuana psychosis: A case study.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 719-733.—A 26-yr-old man with no previous psychiatric history had an acute psychosis after smoking less than 2 marihuana cigarettes. MMPI was administered to the S 1 mo. following the marihuana episode. S had a history of pathological reactions to alcohol. Factors influencing a S's reaction to marihuana include personality factors, the set, and the setting. The pharmacological actions of the drug and the dosage interact with the above factors. The S's experience is atypical, but his experience demonstrates what can happen to a predisposed individual who uses this “innocuous” drug.—*D. Prager.*

4674. Rosarios, Hugo. **Acting out obsesivo.** [Obsessive acting out.] *Revista de Psicoanálisis*, 1969(Oct), Vol. 26(4), 943-952.—Discusses characteristics of acting out in the obsessive patient with illustrations from clinical experience with a 40-yr-old male. Excerpts are given from 2 analytic sessions which illustrate the S's erotic acting out and verbalizations. Observations were that in acting out obsessive Ss (a) theoretically are unable to disassociate thought from action as they are unable to disassociate mind and body; (b) establish a distance, either mental or spatial, with respect to the persecuting object; and (c) convert language and thought into concrete action. It is noted that acting out is a means of

escaping sorrow and, in obsessive Ss, constitutes a refuge in erotic thought into which the analyst seemed unable to be integrated. (17 ref.)—*P. Hertzberg.*

4675. Salganik, E. L. **K atipichnoi simptomatologii êkhinokokka IV zheludochka v detskom vozraste.** [On the atypical symptomatology of echinococcosis of the IV ventricle in childhood.] *Pediatrya*, 1970, Vol. 49(3), 81-82.—Presents a case report showing that echinococcal localization in the IV ventricle in children results in an atypical symptomatology and course.—*I. D. London.*

4676. Salguero, Luis F., Itabashi, Hideo H., & Gutierrez, Norma B. (U. Michigan, Medical School) **Childhood multiple sclerosis with psychotic manifestations.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1969(Dec), Vol. 32(6), 572-579.—Presents a case report of an 11-yr-old girl with multiple sclerosis who also manifested unusual psychotic symptoms. In addition to characteristic lesions in the optic chiasm and tracts, pons, and spinal cord, lesions were found in the basal ganglia, thalamus, hypothalamus, and hippocampus. It is postulated that the mental and affective symptoms developed secondary to involvement of the limbic system and hypothalamus. (38 ref.)—*Journal summary.*

4677. Schneck, Jerome M. (St. Vincent's Hosp. & Medical Center, New York, N.Y.) **Psychogenic impotence with a hypnotherapy case illustration.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 352-354.—Presents a case history in which a 27-yr-old male patient with sexual impotence was successfully treated with hypnotherapy. The experience of various therapists treating cases of impotence is summarized. In general, it is noted that treatment is more successful with younger patients and in cases where there has been some prior, if limited, successful sexual experience. It is felt that a direct therapeutic approach, i.e., hypnotherapy, is more effective than psychoanalytic efforts.—*P. McMillan.*

4678. Ștefan, Margareta & Lazarovici, Hilda. **Considerații asupra unui caz cu sindrom isteric la fetiță infestată cu toxoplasma gondii.** [Considerations with reference in a case of hysterical syndrome in a little girl infested with toxoplasma gondii.] *Neurologia, Psihiatria, Neurochirurgia*, 1968(Mar), Vol. 13(2), 119-124.—Hypothesizes that psychogenically determined seizures only occur in individuals that exhibit mesodiencephalic fragility. The case of a little girl with a hysterical syndrome is reported. The existence of a microlesional background was detected at the neurologic examination. Laboratory tests revealed the presence of toxoplasmosis. Part of the literature concerning the relationship between toxoplasmosis and neuropsychical pathology, especially mesodiencephalic is reviewed. (French, German, & Russian summaries) (28 ref.)—*English summary.*

4679. Theohar, Carl & McKegney, F. Patrick. **Hiccups of psychogenic origin: A case report and review of the literature.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 377-384.—Reviews the literature and presents a case of intractable hiccups with an extensive investigation of the psychogenic origin of the hiccups and their treatment. The hiccups represented a conversion reaction expressing repressed hostility and guilt over sexual conflicts in the S and her family constellation. Treatment by hypnotic suggestion directed at symptom removal combined with slight modification of the interaction between the patient and her family. At 10-mo follow-up, S was functioning in a much more

satisfactory level and had had only a few brief episodes of hiccups. It is suggested that the psychogenic mechanisms of hiccups deserve further attention and that individuals with intractable hiccups should have a full psychosocial evaluation as early as possible in the medical management program.—*Journal summary.*

4680. Voth, Harold M. (Menninger Foundation, Topeka, Kan.) **Choice of illness and defense: A clinical study.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 295-305.—Describes long-term expressive psychotherapy of 4 siblings focusing on the relationship of unconscious conflicts to defense and syndrome choice. Little or no relationship existed between the content of conflicts and the form of syndromes or defense preferences. Conflicts centered around oral and phallic-oedipal levels while defenses and syndromes were highly diverse. Evidence is cited to support the view that defense and syndrome choice are related to stable ego dispositions of unknown origin. (25 ref.)—*Journal summary.*

4681. Wheeler, Andrew J. & Sulzer, Beth. (Southern Illinois U.) **Operant training and generalization of a verbal response form in a speech-deficient child.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 139-147.—An 8-yr-old boy who spoke essentially in "telegraphic" English, leaving out most articles and auxiliary verbs, was trained to use a particular sentence form that included the articles and verbs to describe a set of standardized pictures. The S used the trained sentence form to describe the trained pictures, and in addition, use of the sentence form generalized to sets of untrained and novel stimuli. When the trained sentence form was changed, the S used the new form to describe both training and generalization stimuli. When the original correct form of response was retrained, the S once again used the trained sentence form to respond to both training and generalization trials.—*Journal abstract.*

MENTAL HEALTH & REHABILITATION

4682. Boffey, Philip M. **California: Reagan and the mental health controversy.** *Science*, 1968(Sep), Vol. 161(3848), 1329-1331.—Discusses the arguments from both sides of the 1967 controversy over R. Reagan's proposed budget cuts on the California State Department of Mental Hygiene. The effects of the final legislation, less severe cuts than originally proposed, are discussed. It is concluded that the long-term effects of the controversy and its aftermath may have benefited the mental health programs.—*M. Maney.*

4683. Christmas, June J. (Harlem Hosp. Center, Div. of Rehabilitation Services, New York, N.Y.) **Socio-psychiatric rehabilitation in a black urban ghetto: I. Conflicts, issues, and directions.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 651-661.—Discusses the background, development, and programs of a multiservice community-based rehabilitation program in a black urban ghetto. "Rehabilitative services are organized into 3 programs using multiple group approaches in a therapeutic community and providing interdisciplinary services. Social and community services, health services, psychiatric rehabilitation, vocational rehabilitation, and continuing rehabilitation programs are included. Philosophical orientation, goals, practice, the nature of the rehabilitative process, and "transactions between the wider society and institutions in the urban slum ghetto" are discussed. It is concluded

that the services provide a means for individual, group, and social change.—G. Steele.

4684. Distefano, M. K. & Pryer, Margaret W. (Central Louisiana State Hosp., Pineville) **Predicting vocational outcome of psychiatric patients with the Edwards Personal Preference Schedule.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 552-554.—Evaluated the validity of the EPPS in predicting vocational success of psychiatric patients and evaluated a special predictive model described by A. Goss to determine if its application could significantly increase the predictive accuracy of the EPPS. The EPPS was administered to 47 male and 64 female psychiatric patients upon admission to a vocational rehabilitation program in a state mental hospital. Follow-up of these Ss on subsequent success or failure outcome in the program revealed no significant relationship between any of the EPPS scales and vocational success. Evaluation of the Goss model with the total sample and with a subgroup of schizophrenic patients reveals no support for increased predictive efficiency.—*Journal abstract.*

4685. Gottschalk, Louis A., deGroot, Joanne C., & Whitman, Roy M. (U. California, Medical School, Irvine) **An evaluation of a program of continuing education in community mental health.** *Comprehensive Psychiatry*, 1969(Nov), Vol. 10(6), 423-442.—The methodology of evaluation of the attitudinal and behavioral changes effected by such an educational program is a difficult and to some extent an unsolved problem. Based on the self-reports from trainees (mental health professionals participating in a 4-wk intensive seminar workshop demonstration-type of educational experience in community mental health practice), the educational program was successful. However, implementation of attitudes into activities commensurate with the program's goals was unconvincing. Only future research can test whether longer term follow up will reveal more actual carrying out of educational goals of community mental health programs. The most frequently proposed change recommended by trainees to increase the effectiveness of the program was to place greater emphasis on group interaction and discussion in small groups. This research was designed so as to minimize E bias or systematic measurement error." (20 ref.)—D. Prager.

4686. Hirschowitz, Ralph G. (Harvard Medical School, Lab. of Community Psychiatry, Boston, Mass.) **Changing human behavior in the state hospital organization.** *Psychiatric Quarterly*, 1969(Oct), Vol. 43(4), 591-611.—Describes a social rehabilitation program for chronic regressed state hospital patients (N = 6). Aide-therapists were primarily responsible for the rehabilitation, re-education, and remotivation of patients. Success is attributed to an organization which was open, permitting concern for all its members and generating hope in a "humanizing network where all are permitted to trust, respect, and value one another." (26 ref.)—D. Prager.

4687. Lurie, Olga R. (Westchester County Mental Health Assn., White Plains, N.Y.) **The emotional health of children in the family setting.** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 229-235.—Describes a mental health association project in a metropolitan suburb designed as a basis for planning services for children. The emotional health or impairment of 800 3-18 yr. old Ss in the general population was estimated. Mothers were interviewed in their homes by trained interviewers. Information obtained, supple-

mented by data from school records, was evaluated by child psychiatrists who rated the emotional health of each S on a 5-point scale from well to severely impaired. Family functioning was also rated. Principle findings suggest that emotional impairment in nonclinic community children (a) exists extensively in varying degrees, (b) is not being treated in a substantial number of cases, (c) is related to family composition and functioning, (d) differs in extent in diverse social and economic groups, and (e) is differentially regarded by parents according to socioeconomic factors. The relationship of impairment to a number of demographic, familial, and behavioral variables is discussed.—*Journal abstract.*

4688. Stoller, Alan. (Mental Health Research Inst., Melbourne, Australia) **Urbanization and mental health.** *Medical Journal of Australia*, 1969(Aug), Vol. 2(5), 223-228.—Examined Australian data and compared it with American studies on advancing industrialization and mental health. Pathological results often cited of urbanization, besides mental illness, are juvenile delinquency, suicide, marital breakdowns, illegitimate births and extranuptial conceptions, alcoholism, crime, and increasing road accidents. The effect of noise on mental health is also discussed. Evidence shows that "... there is no clear evidence that mental disorders are increasing with high-density urbanization; in fact, there is evidence to show that there is, with advancing medical progress, an actual decrease in certain types of disorders." (58 ref.)—A. M. Berg.

COUNSELING & GUIDANCE

4689. Lewis, Edwin C. (Iowa State U.) **The psychology of counseling.** New York, N.Y.: Holt, Rinehart, & Winston, 1970. ix, 306 p.

4690. Nordberg, Robert B. (Marquette U.) **Guidance: A systematic introduction.** New York, N.Y.: Random House, 1970. x, 212 p.

4691. Osipow, Samuel H. & Walsh, W. Bruce. (Ohio State U.) **Behavior change in counseling: Reading and cases.** New York, N.Y.: Appleton-Century-Crofts, 1970. viii, 260 p.

4692. Pope, Benjamin; Slegman, Aron W., & Blass, Thomas. (Sheppard & Enoch Pratt Hosp., Baltimore, Md.) **Anxiety and speech in the initial interview.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 233-238.—Presents the 2nd experimental investigation in a series dealing with the relationship between anxiety arousal and interviewee verbal behavior. In an earlier experimental study, anxiety was manipulated through the use of a neutral topic and an anxiety-arousing topic. However, it was felt that the anxiety-arousing effects of the 2 topics could have been confounded with content effects. To avoid this possible confounding, the present study was designed to manipulate anxiety in the interview without altering topic. Basic results confirm those of the 1st study, i.e., anxiety functions as an activator of speech increasing productivity, simultaneously disrupting its flow by increasing the frequency of speech disturbances. (15 ref.)—*Journal abstract.*

Marriage & Family

4693. Mathieu, M. **Réflexions sur le couple: A propos de deux séminaires de formation au conseil conjugal.** [Reflections on the couple: On two formative

seminars for marriage counseling.] *Hygiène Mentale*, 1969(May), Vol. 58(2), 51-60.—Discusses Freud's view of marriage as based on libidinal needs and attachments and Dicks' view of marriage as a social institution involving a system of interpersonal relations and a functional dyadic unity. Also discussed are the difficulties in conveying such views in training marriage counselors based on experience in 2 training seminars.—*W. W. Meissner*.

4694. Rogers, Lawrence S., et al. (Veterans Administration Hosp., Mental Hygiene Clinic, Denver, Colo.) **Marital stability, mental health, and marital satisfaction.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 342-348.—Administered a test of emotional stability and a marital satisfaction scale to 50 couples seeking help with their marriage and to 50 couples with stable marriages. The stable group scored significantly higher on each of the 4 subtests of the emotional stability test as well as on the total score. For the stable group there was a significant relationship between marital satisfaction and emotional stability, but this finding did not hold for the group seeking help. The hypothesis was not supported that women who marry men with emotional problems are more unstable themselves, or that if 1 partner in a marriage is emotionally unstable the other tends to also become emotionally unstable. (19 ref.)—*Journal abstract*.

Social Casework

4695. Hobson, Caroline J. & Davis, W. Grayburn. (Denver Clinic, Colo.) **Social work in group medical practice.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 355-357.—Describes a social service department established in a private practice setting in a multispecialty city clinic. Many private patients have illnesses associated with serious emotional or social problems with which a social worker can be of great help. The social worker—trained in the dynamics of human behavior, better able to communicate with patients, and acquainted with community resources—can free the physician for a more effective use of his time. 4 illustrative case summaries are provided.—*P. McMillan*.

PHYSICAL HANDICAP

4696. Bose, S. & Benerjee, S. N. (Rehabilitation Centre, Calcutta, India) **A resolution on the personality make-up of some institutionalized physically handicapped children by the Children's Apperception Test.** *Journal of Psychological Researches*, 1969, Vol. 13(1), 32-36.—Almost all of the Ss had behavioral peculiarities, e.g., scholastic aversion, inferiority feelings, food finickiness, shyness, emotional imbalance, speech difficulty, apprehensiveness, selfishness, hoarding tendency, etc. $\frac{1}{4}$ of them were backward, 20% average, and 30% borderline in intelligence. Oral and oedipal needs, conflicts between superego and need for activity, need for aggression, anxieties of physical harm and loss of parental love, repressed autoerotic urges, regression into mother's womb and partial regression into oral stage were some of the dominant tendencies exhibited, while 90% of them had normal ego strength.—*U. Pareek*.

4697. Heckhausen, Heinz & Oswald, Andreas. (Ruhr U., Psychologische Inst., Bochum, W. Germany) Er-

ziehungspraktiken der Mutter und Leistungsverhalten des normalen und des gliedmabengeschädigten Kindes. [Childrearing practices of mothers and performance of children having damaged limbs.] *Archiv für die gesamte Psychologie*, 1969(Aug), Vol. 121(1), 1-30.—Observed 80 mother-child pairs in their homes during a standardized problem solving situation. $\frac{1}{2}$ of the 4-5 yr. old children were handicapped (intrauterine effect of thalidomide drug). The mother's level of (a) aspiration for the performance of the child, (b) frequency of positive and negative reinforcements contingent on the child's performance, and (c) frequency of specific or nonspecific directions designed to help the child perform his task was assessed. The child's goal setting, the frequency of his asking for help, and his IQ were scored. Results support several hypotheses based on principles of a theory of motive origin, and hold for both the normal and handicapped group. (French summary) (26 ref.)—*English summary*.

4698. Kir-Stimon, William. (280 N. Michigan, Chicago, Ill.) **Counseling with the severely handicapped: Encounter and commitment.** *Psychotherapy: Theory, Research & Practice*, 1970(Sum), Vol. 7(2), 70-74.—"There is among these people a deep sense of being forlorn, alienated from the rest of the world . . . In my experience it is not the specific nature of the disease entity itself that is important, but the way in which it has changed . . . the patient's relationship to himself and his world." Treatment fallacies are listed.—*H. K. Moore*.

4699. Rendle-Short, John. (U. Queensland, Australia) **The care of the child with a long-term handicap.** *Medical Journal of Australia*, 1969(Sep), Vol. 2(12), 604-606.—Presents the need for a team approach to the diagnosis, prevention, and management of children with long-term handicaps. The doctor and parents are recognized of prime importance in the coordination of this approach. Parental and community attitudes, the nature of the handicap, and the child's emotional reaction affect treatment. Curative, symptomatic, palliative, and supportive treatment programs are discussed.—*G. Steele*.

4700. Taylor, George P. (Kenny Rehabilitation Inst., Minneapolis, Minn.) **Moderator-variable effect on personality-test-item endorsements of physically disabled patients.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 183-188.—Demonstrates that personality instruments are significantly confounded by the somatic characteristics of physically disabled Ss, illustrates the nature and effect of this moderator variable of physical condition on MMPI item endorsements for traumatic spinal-cord-injured males, and suggests 2 methods of controlling the moderator variable's effect. The MMPI item responses of 28 cord-injured males were compared to 28 noninjured males similar in age, marital status, and matched on a measure of socioeconomic status. The 12 items that significantly (.05) differentiated the 2 groups and that described the patient's current somatic condition were discerned to affect profile elevation (reliably elevating Scales 1, 2, and 3) and, when profiles were submitted to a computer scoring and interpreting program, to affect interpretation. (17 ref.)—*Journal abstract*.

4701. Zara, Ronald C. (U. Houston) **Expectations of social reaction toward self as related to cognitive style and locus of control in persons with obvious and hidden physical handicaps.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 404.

Blindness & Visual Disorder

4702. Duran, Peter. (U. Illinois) **Imagery and blindness: A personal report.** *Journal of Humanistic Psychology*, 1969(Fall), Vol. 9(2), 155-166.—Presents a personal introspective report on the dream, aural, spatial, color, visual, and tactual imagery of a blind person. How an image acquires a denotation and a sense is described through an illustrative example, and representation and perceptual knowledge are discussed. The difference in a blind child's representational and perceptual knowledge and that of a sighted person's greatly influences his ability to understand raised line drawings and models currently used in teaching blind children in some schools. It is concluded that since existing physiological and psychological data indicate that the abilities of the blind are general phenomena, there is no experimental reason to postulate a special psychology for the blind.—M. Maney.

4703. Graham, Milton D. (American Foundation for the Blind, New York, N.Y.) **Multiply impaired blind children: A national problem.** New York, N.Y.: American Foundation for the Blind, 1968. 82 p. \$1.50(paper).—Presents a survey investigating the incidence and type of handicap and the training available for multiply impaired (MI) blind children. Questionnaires were returned on 8887 MI blind children. Although data are limited because of terminology misinterpretation due to the method of data collection, it is concluded that "a national approach to possible programs" for the welfare and education of Ss is warranted.

4704. Gray, P. G. & Todd, Jean E. **Mobility and reading habits of the blind.** London, England: Her Majesty's Stationery Office, 1965. xiv, 119 p.

4705. Hidalgo, Zeta D. (540 W. Iron, Salina, Kan.) **A brief discussion of color deficiencies.** *Journal of the American Optometric Association*, 1969(May), Vol. 40(5), 522-525.—Reviews theoretical aspects of color vision and its possible deficiencies. The defects in color vision for trichromats, dichromats, and monochromats are discussed. Trichromatism, generally considered normal vision, may sometimes have anomalous characteristics in which the individual may be weak in his perceptions of reds, greens, or blues. Means for testing color deficiency in an optometric office are discussed. Suggested illumination and test plates are described.—P. McMillan.

4706. Juurmaa, Jyrki; Suonio, Kyösti, & Mollanen, Aatu. (Inst. of Occupational Health, Helsinki, Finland) **The effect of training in the perception of obstacles without vision.** *Reports from the Institute of Occupational Health, Helsinki*, 1968(Jun), No. 55, 36 p.—Investigated the effect of practice on 3 visually handicapped but not totally blind male Ss' perception of obstacles during a 4-wk period. Ss were systematically trained to perceive various obstacles which were randomly situated on their walking route. The behavior of the recorded obstacle-perception variables shows that rapid learning took place in all Ss. The average 1st perception distances indicate that, by the end of the training series, Ss were able to perceive obstacles at a distance of 1.5 m. Results suggest that a person can be trained rapidly to avoid colliding with obstacles, that the ability to estimate the size of obstacles takes longer to learn, and that transfer effects occur in the learning of obstacle perception.—*Journal summary*.

4709. Ames, Mary D., Plotkin, Stanley A., Winchester, Richard A., & Atkins, Thomas E. (1740 Bainbridge St., Philadelphia, Pa.) **Central auditory imperception: A significant factor in congenital rubella deafness.** *JAMA: Journal of the American Medical Association*, 1970(Jul), Vol. 213(3), 419-421.—Describes the diagnostic procedures used for 76 boys and 42 girls who were not responding to sound, not developing speech, or whose mothers had known rubella infection during pregnancy. Diagnosis of central auditory imperception (CAI) was made by audiometry including pure tone, aural-palpebral reflex, sound localization, passive listening, active listening, withdrawal response, painful response, and EEG response. Level of mental functioning was also established. It was found that auditory impairment was the primary cause of failure to develop speech. 50 Ss had CAI, 30 of which had pure CAI with no peripheral hearing loss or blindness. Other Ss were delayed due to global development retardation, concomitant cerebral palsy, and simple delay of speech development. There was "no statistical difference in time of rubella exposure of the fetus between those without [CAI] nor in incidence of mental retardation." The importance of early identification and diagnostic differentiation of mental retardation, peripheral hearing loss, and CAI is discussed.—P. Hertzberg.

4711. Colton, Raymond H. & Cooker, Harry S. (U. Florida) **Perceived nasality in the speech of the deaf.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 553-559.—Obtained listener ratings of nasality from samples of deaf (N = 28) and normal (N = 28) speech presented in the backward play mode. In order to investigate the influence of rhythmic patterning on the perception of nasality, 7 of the normal speakers also produced the samples in a word-by-word fashion. Statistically significant differences in mean ratings of nasality were found between the experimental and control groups and between the reduced-tempo and normal-tempo groups. In general, deaf speakers are perceived as more nasal than normal speakers. Normal speakers are perceived as more nasal when speaking at a reduced tempo than when speaking at a normal tempo. Much of the perceived nasality in the speech of the deaf may be a natural consequence of reduced speaking tempo, and therapeutic techniques designed to increase speaking tempo may produce a concomitant reduction in perceived nasality.—*Journal abstract*.

4712. Green, David S. & Ross, Mark. (New Haven Hearing & Speech Center, Conn.) **The effect of a**

conventional versus a nonoccluding (CROS-type) earmold upon the frequency response of a hearing aid. *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 638-647.—Obtained sound-field Bekesy audiograms from 1 experienced hearing-impaired S wearing an ear-level hearing aid with a conventional earmold and a nonoccluding CROS-type earmold. Comparisons were made to determine the effects of the 2 different types of earmolds as well as different tubing lengths for nonoccluding CROS-type earmolds. Findings indicate that: (a) a nonoccluding CROS-type earmold alters the frequency response characteristics of a hearing aid by markedly reducing the amplification for the low frequencies, (b) the length of tubing has a minor effect compared with that caused by the nonoccluding CROS ear coupler, and (c) sound-field Bekesy audiometry is a reliable and valid tool for assessing changes in the amplifying characteristics of hearing aids.—*Journal abstract*.

4713. Hogan, H. Wayne. (Tulane U.) **Authoritarianism among white and black deaf adolescents: Two measures compared.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 195-200.—Tested 32 white and 38 black deaf adolescents for the personality dimension of authoritarianism, using a symbolic test and the verbal Adorno F-scale. As expected, scores were in the direction of greater authoritarianism on both tests for both groups, though the symbolic measure yielded the more marked and unambiguous results. (33 ref.)—*Journal abstract*.

4714. Kopra, Lennart L., Blosser, Dennis, & Waldron, Daryle L. (U. Texas) **Comparison of Fairbanks Rhyme Test and CID Auditory Test W-22 in normal and hearing-impaired listeners.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 735-739.—Administered the Fairbanks Rhyme Test and Auditory Test W-22 at -4, 0, 8, 16, 24, 32, and 40 db. sensation levels to 15 15-65 yr. old listeners with sensorineural hearing loss and 15 19-37 yr. old normal listeners. The articulation functions for the 2 tests were similar for the 2 groups of listeners. The 2 tests appear equal in ability to differentiate normal listeners from listeners with sensorineural loss. It is suggested that certain nonessential advantages of the Rhyme Test may make it preferable to Auditory Test W-22 since both tests appear to be equivalent indicators of speech-sound discrimination.—*Journal abstract*.

4715. Krechetova, E. Podvlg materi. [The feat of one mother.] *Defektologiya*, 1970, Vol. 2(1), 84-87.—Presents the life history of a deaf boy and his development in school and at home.—I. D. London.

4716. Owens, Elmer & Schubert, Earl D. (U. California, San Francisco) **The development of constant items for speech discrimination testing.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 656-667.—Observed consonant errors on speech discrimination test lists employing a closed-set response system. 15 English-speaking adults with hearing impairment were employed for the 1st list and 20 each for the remaining 4 lists, with an occasional S serving in more than 1 group. Confusions between unvoiced and voiced consonants rarely occurred; the /r/ and /l/ were seldom confused with other phonemes; and nasals were seldom confused with nonnasals. Discrimination difficulty was related to both place and manner of articulation.—*Journal abstract*.

4717. Owens, Elmer; Talbott, Carolyn B., & Schubert,

Earl D. (U. California, San Francisco) **Vowel discrimination of hearing-impaired listeners.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 648-655.—Observed vowel discrimination ability in 2 groups of 20 hearing-impaired Ss each. Each group listened to a different list of closed-set test items specifically designed for the study. A surprisingly low number of errors occurred, suggesting that vowel items in general lack the efficiency required for speech discrimination testing using a closed-set response system. The phonemes most frequently substituted in error were adjacent to the stimulus phoneme on the Formant 1 vs. Formant 2 vowel charts. The /u/ was the most frequent substitution for several vowels.—*Journal abstract*.

4718. Payne, Peter D. & Payne, Regina L. (Bradley U.) **Behavior manifestations of children with hearing loss.** *American Journal of Nursing*, 1970(Aug), Vol. 70(8), 1718-1719.—A summary of the characteristics of a hearing defective child may be useful to school, public health, and pediatric nurses who are able to observe children in various situations over a period of time. These characteristics are of the child whose hearing loss is sufficient to cause problems but not severe enough to be detected. The child is usually described as inattentive, shy, and living "in a world of his own." A speech problem is an important symptom as is the frequent complaint of earache and other ear difficulties. He makes frequent requests to have things repeated and may not follow directions or follow them incorrectly. This behavior may be mistaken for arrogance or mental retardation. Medical records should be checked for a family history of hearing loss, complicated pregnancy and delivery, prematurity, neonatal disease or earache. It is suggested that children with these conditions in their background should have periodic hearing tests.—B. A. Burkard.

4719. Williams, Cyril E. (Borocourt Hosp., Reading, England) **Some psychiatric observations on a group of maladjusted deaf children.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1970(May), Vol. 11(1), 1-18.—Found the psychiatric disorders encountered in 51 maladjusted deaf children to be similar to those found in normal children and those handicapped in other ways. This group was characterized by a low percentage of Ss with intelligible speech and marked educational retardation. Early diagnosis of deafness was associated with a much lower incidence of speaking children than when diagnosis was delayed until after the age of 2. A high proportion of the cases had suffered from severely disturbed home backgrounds. This was particularly marked in those Ss with antisocial disorders, but very uncommon with Ss with child psychosis. There were extremely few Ss with neurotic disorder and it would seem that the school is used chiefly for children who disturb others. The importance of communicating with deaf children by all possible means to promote good personality development and to prevent maladjusted behavior is emphasized. 6 case histories of maladjusted deaf children are included.—*Journal summary*.

4720. Wright, H. N. (State U. New York, Upstate Medical Center, Syracuse) **The effect of sensori-neural hearing loss on threshold-duration functions.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 842-852.—Explored previous findings on the threshold for tones as a function of their duration which have suggested that such functions may be systematically

affected by sensorineural hearing losses of cochlear origin, and determined whether the amount of hearing loss present has any effect upon the results which are obtained. Preliminary studies were also carried out on a conductively impaired listener to indicate whether hearing losses of this type affect the threshold-duration function. Results indicate that the threshold-duration function is systematically affected by sensorineural hearing losses of cochlear origin. This effect is manifested by a progressive shortening of the time constant relating threshold to duration and is not uniquely related to the amount of hearing loss present. Results obtained from the conductively impaired listener suggest that this type of hearing loss has no effect on the threshold-duration function, thereby implying that such functions may contribute significantly to the differential diagnosis of auditory disorders.—*Journal abstract.*

SPEECH DISORDER

4721. Beauvois, J. L. & Ghiglione, R. (Centre U., Vincennes, France) **Recherches sur les attitudes paradigmatic et syntagmatic.** [Research concerning paradigmatic and syntagmatic attitudes.] *Journal de Psychologie Normale et Pathologique*, 1970(Apr), Vol. 67(2), 171-184.—Explored relationships between 2 aspects of language and 2 types of aphasia by studying the bipolarity of discussion at the psycholinguistic level. Following Jakobson's lead, Ss were differentiated by means of a forced choice association test which was administered to Ss whose attitudes were categorized as paradigmatic and syntagmatic. A test of syntactic integration yielded different productions by the 2 groups. Thus, it seemed that these 2 attitudes lend themselves to situational manipulation. It was found that frustration provoked in communication leads to a significant paradigmation of associative responses. 2 hypotheses were posed: (a) these attitudes refer to 2 styles of communication; and (b) paradigmation of association when communication is difficult occurs by a process of retrogression.—*L. A. Ostlund.*

4722. Brookshire, Robert H. (Veterans Administration Hosp., Kansas City, Mo.) **Visual discrimination and response reversal learning by aphasic subjects.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 677-692.—Presented 9 aphasic and 8 nonaphasic hospital patients with a discrimination learning problem in which they learned differential motor responses to visual stimuli. Ss 1st were reinforced for emitting Response A in the presence of Stimulus A, and Response B in the presence of Stimulus B. Then they were placed in a reversal situation in which they were reinforced for emitting Response B in the presence of Stimulus A, and Response A in the presence of Stimulus B. Results indicate that aphasic Ss had more difficulty than nonaphasics in both discrimination tasks. However, responses of most aphasic Ss who did not learn the discrimination were not random but reflected strategies which resulted in substantial numbers of reinforcements. Aphasic Ss tended not to improve upon initial performance within treatment sessions, unless either stimuli or consequences for responses were changed. Clinical evidence is presented which indicates that S impairments which appear in the experimental task also appear in subsequent clinical activities.—*Journal abstract.*

association task. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 432-433.

4724. Curlee, Richard F. & Perkins, William H. (U. Southern California) **The effect of punishment of expectancy to stutter on the frequencies of sub-sequent expectancies and stuttering.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 787-795.—Assigned 12 17-36 yr. old stutterers to experimental, shock-control, and time-control groups to investigate the effect of punishment of signaled expectancies to stutter on the frequencies of expectancy and stuttering subsequent to punishment. Electroshock was contingent on signaled expectancies in the experimental group, but was not contiguous to verbalizations in any group. Frequencies of expectancy and stuttering significantly decreased following punishment of signaled expectancies to stutter. (15 ref.)—*Journal abstract.*

4725. Dubois, J., et al. **Analyse linguistique d'énoncés d'aphasiques sensoriels.** [A linguistic analysis of statements of sensory aphasics.] *Journal de Psychologie Normale et Pathologique*, 1970(Apr), Vol. 67(2), 185-206.—Studied the spontaneous statements of 4 right-handed and 2 left-handed sensory aphasics. It was found that linguistic analysis permits one to proceed to a classification of diverse types of disturbances previously imperfectly distinguished. One can specify explanations concerning the relationship between disturbances of reception (i.e., deafness, or lack of understanding), and disturbances of emission (substitutions or neoforms).—*L. A. Ostlund.*

4726. Franks, B. Don & Franks, Elizabeth B. (U. Illinois, Champaign) **Effects of physical training on stuttering.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 767-776.—Divided 8 undergraduates enrolled in group therapy for stuttering into 2 equal groups for 20 wk. The training group supplemented therapy with endurance running and calisthenics 3 days/wk. Ss were tested prior to and at the conclusion of the training on a battery of stuttering tests and cardiovascular measures taken at rest, after stuttering, and after submaximal exercise. There were no significant differences (.05 level) prior to training. At the conclusion of training, the training group was significantly better in cardiovascular response to exercise and stuttering. Although physical training did not significantly aid the reduction of stuttering as measured in this study, training did cause an increased ability to adapt physiologically to physical stress and to the stress of stuttering. (36 ref.)—*Journal abstract.*

4727. Fristoe, Macalyn & Goldman, Ronald. (Vanderbilt U., Medical School) **Comparison of traditional and condensed articulation tests examining the same number of sounds.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 583-589.—Presented the same recorded speech samples of Ss with articulation defects to judges under 2 listening conditions. Under 1 condition each judge listened for only 1 sound/sample word, the traditional method for testing articulation. Under the 2nd condition each judge listened for 1, 2, or 3 sounds in the various sample words, a quicker method for testing the same number of sounds. Comparisons of the results show that there was little difference in the judges' performance under the 2 listening conditions. This suggests that speech pathologists can effectively evaluate more than 1 sound/word and that a condensed type of test will give approximately

the same amount of information as the longer, traditional type of test.—*Journal abstract.*

4728. Haroldson, Samuel K., Martin, Richard R., & Starr, Clark D. (U. Minnesota) **Time-out as a punishment for stuttering.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 560-566.—Studied the effects of making time-out from positive reinforcement (TO) contingent on stuttering in 4 adult stutterers. The theoretical basis of the study revolved around the notion that speaking is self-reinforcing, and that making TO from speaking contingent upon a specific response will decrease the frequency of that response. Ss spoke spontaneously and a red light was illuminated for 10 sec. contingent upon each stuttering. Ss were not allowed to speak while the light was illuminated. All 4 Ss evidenced a marked decrease in stuttering frequency during TO sessions and some extinction of the suppression effect was observed when TO was removed. (18 ref.)—*Journal abstract.*

4729. McDearmon, James R. (Washington State U.) **Primary stuttering at the onset of stuttering: A reexamination of data.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 631-637.—In a re-examination of data in Study III by W. Johnson (see PA, Vol. 33:10621) it was found that: (a) among experimentals, at least 63% of children labeled as stutterers by at least 1 parent evidenced "primary stuttering" (simple repetitions and prolongations of sounds and syllables) at onset time, and at least 28% evidenced only "normal nonfluencies" (repetitions of words and phrases, and other interruptions common in children), as indicated by parents' responses to 1 question; (b) "primary stuttering" was much more frequent, and "normal nonfluency" much less frequent, in Ss at onset of stuttering than in controls; and these differences were statistically significant; and (c) slight tension was the only "secondary" reaction indicated in more than 15% of Ss at onset, according to parents' responses to other questions. At onset Ss and controls were significantly differentiated in incidence of tension, but not in incidence of indifference, awareness, or irritation. "Secondary" reactions in Ss showed considerable increase within an average of about 18 mo. after apparent onset. Results support the concept of primary stuttering as a beginning phase of a severity continuum.—*Journal abstract.*

4730. Michel, John F. (U. Kansas) **Fundamental frequency investigation of vocal fry and harshness.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 590-594.—10 adult males recorded a standard passage in their normal voices and then in vocal fry. A 2nd group of 10 males whose voices had been clinically diagnosed as harsh recorded the passage in their usual harsh voice. The Fundamental Frequency Indicator and the phonellegraph were used to obtain fundamental frequency data from these recordings. A mean fundamental frequency of 36.4 Hz. with a range of 30.9-43.7 Hz. was found for vocal fry; the mean of the harsh voices was 122.1 Hz. within a range of 103.7-180 Hz. Normal fundamental frequencies ranged from 98.4-125.1 Hz. with a mean of 110.6 Hz. It was found that vocal fry can be differentiated from clinical harshness and normal phonation on the basis of mean fundamental frequency and that clinical harshness and normal phonation could not be so differentiated.—*Journal abstract.*

4731. Muma, John R., Laeder, Ronald L., & Webb, Clarence E. (U. Georgia) **Adolescent voice quality**

aberrations: Personality and social status. *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 576-582.—78 high school students, identified as possessing voice quality aberrations for 6 mo., constituted 4 experimental groups: breathiness, harshness, hoarseness, and nasality. The 4 experimental groups were compared with 38 controls according to personality characteristics, as determined by the MMPI, and peer evaluations. Results indicate that there was no relationship between voice quality aberration and either personality characteristics or peer evaluations. (17 ref.)—*Journal abstract.*

4732. Prins, David. (U. Michigan) **Pre-therapy adaptation of stuttering and its relation to speech measures of therapy progress.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 740-746.—Obtained 3 measures of stuttering adaptation on 20 male 14-19 yr. old stutterers prior to the beginning of an 8-wk residential therapy program. Following therapy each S was evaluated using 6 scores which represented changes in speaking rate and frequency of stuttering during oral reading and in self-formulated speech. Results show that less than 1/2 of the stutterers demonstrated a significant adaptation trend, and only 12 showed significant normal deviate scores of adaptation. Partial correlation coefficients were significant in a negative direction between pretherapy percentage and trend adaptation measures and posttherapy scores showing increment in reading and speaking rate. It appears that adaptation is neither consistently nor highly related to speech measures of therapy progress. A rationale is suggested for the negative correlation of adaptation and therapy change scores.—*Journal abstract.*

4733. Sederqvist, Pirkko A. **Speech disorders and sociopreferential dynamics.** *Annales Academiae Scientiarum Fennicae*, 1970, Vol. B-167, 122 p.—Studied the connection between speech disorders and the pupil's status among classmates. It was found that there was no simple relation with type or severity of disorder although an overall effect such that speech-disordered Ss received sociometric choices from the lowest classes, while avoiding choices among themselves. Speech disorder generally was not given as the reason for not choosing an affected person in the sociometric situation. Some compensatory interests were indicated by special disordered pupils but the effect was not as strong as hypothesized.—S. G. Vandenberg.

4734. Spreen, Otfried. (U. Victoria, British Columbia, Canada) **Psycholinguistic aspects of aphasia.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 467-480.—Reviews research and theoretical articles investigating psycholinguistic aspects of aphasia. The major parts of the review include the concept of regression in aphasic language both on an ontogenetic and a microgenetic level, and studies of specific parameters, i.e., abstractness. The approach of mathematical linguistics and the types of aphasia described on the basis of linguistic evidence are discussed. (3 p. ref.)—*Journal abstract.*

4735. Webster, Ronald L. & Lubker, Bobbie B. (Hollins Coll.) **Interrelationships among fluency producing variables in stuttered speech.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 754-766.—Presents a limited theory (Auditory Interference Theory) which integrates data on fluency producing variables in terms of modified temporal aspects of auditory feedback in stuttered speech. The probable basis for stuttering is inferred to involve

interference between air-conducted and bone-conducted auditory feedback. Middle ear muscle reflexes are suggested as a possible mechanism for the mediation of interference between components of auditory feedback. (2 p. ref.)—*Journal abstract*.

4736. Williams, Dean E., Silverman, Franklin H., & Kools, Joseph A. (U. Iowa) **Disfluency behavior of elementary school stutterers and non-stutterers: The adaptation effect.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 622-630.—184 elementary school children, 92 stutterers, and 92 matched nonstutterers, performed a speaking task 3 times consecutively. Kindergarten and 1st grade Ss repeated a series of sentences, and 2nd-6th grade Ss read a passage. Both the stutterers and the nonstutterers exhibited the adaptation effect. Both adapted proportionally to approximately the same degree. There was no tendency in either group for the degree of adaptation to vary as a function of grade level. Whether or not a S exhibited the adaptation effect appeared to be more closely related to how disfluent he was on his 1st performance of the task than to whether he had been labeled as a stutterer or a nonstutterer. Results indicate that adaptation is not unique to stutterers, but is to be found also in normal speakers. (18 ref.)—*Journal abstract*.

4742. Botek, M. I. & Popescu, F. **Sindromul de amnezie globală tranzitorie.** [The transient global amnesia syndrome.] *Neurologia, Psihiatria, Neurochirurgia*, 1968(Mar), Vol. 13(1), 153-160.—Reports on 5 cases of transient global amnesia syndrome, 4 of which were followed for 2-8 yr., without recurrence of the attack. The memorization process is assumed to have 3 forms: immediate, short-term, and long lasting memory. The transient global amnesia syndrome is due to perturbation of short-term memory, probably in the field of the enzymatic mechanisms that ensure the transformation of the engrams of the neuronal network into biochemical engrams. (French, German, & Russian summaries) (16 ref.)—*English summary*.

4743. Cohn, Robert. (U.S. Naval Hosp., Bethesda, Md.) **Amnesic aphasia and other disturbances in naming.** *Archives of Neurology*, 1970(Jun), Vol. 22(6), 515-520.—Amnesic aphasia, explained variously throughout history, consists of the inability to name a particular common object despite having the ability to reformulate the word when presented. Such naming difficulties can result from disturbances in brain mechanisms for data encoding and decoding. Findings that demonstrate answers in the same category, e.g., giving a color name when one is asked for (though an incorrect one) weaken Goldstein's view that "categorization can be equated with the loss of the abstract attitude." Naming difficulties resulting from tissue damage suggest that the "dominant cerebral hemisphere loses its library of consolidated memory for particular names, or its ability to functionally retrieve data correctly from the library of fixed names, or both."—S. E. Gavin.

The pathogenesis, clinical picture, diagnosis, and treatment of spinal diseases are detailed.—I. D. London.

4745. Fernández Martín, Fernando M. **Apraxia constructiva.** [Construction apraxia.] *Revista de Psiquiatría y Psicología Médica*, 1969(Oct), Vol. 9(4), 245-254.—Construction apraxia has many aspects and variants. While it is unique in its manifestation, its mechanisms and conditions of appearance are many. In a large number of patients lesions in the right hemisphere produce a syndrome of visual and spatial agnosia, which determines the characteristic of the construction apraxia. In the progressive bilateral lesions at least, construction apraxia is nested within the processes of mental deterioration and presages the latter. In left hemisphere lesions construction apraxia is less well defined; it is actually an essentially praxic disturbance of execution; its relation to other symbolic functions is yet to be determined. (17 ref.)—L. Zusne.

4746. Gimeno Alava, A. **Apraxia ideomotriz.** [Ideational motor apraxia.] *Revista de Psiquiatría y Psicología Médica*, 1969(Oct), Vol. 9(4), 221-243.—Discusses clinical cases seen by the author over a number of years. There are clear parallels between aphasia and apraxia. Bilateral ideational motor apraxia is on a hierarchically lower level than those involving linguistic symbols, construction praxis, right-left discrimination, and digit recognition, but higher than ideational praxis and body

perception. Bilateral apraxia is frequently right-dominant. Unilateral ideational motor apraxias always affect the left side. Ideational motor apraxias as well as aphasia may be understood and studied as a cybernetic phenomenon since they are theoretical analogs of defects in the basic units of a digital computer. Although aphasias and apraxias share common features of cerebral functioning, they become hierarchically organized as more complex levels of functioning are acquired in time. The first levels acquired are the simplest and are also the most resistant to the effects of lesions. The frequency of higher level syndromes (aphasia, acalculia, apraxias, etc.) is directly related to the position of the syndrome in the hierarchy of functions as well as to the extent of the lesion. (63 ref.)—*L. Zusne.*

4747. Guimón Ugartechea, José. **La apraxia ideatoria.** [Ideational apraxia.] *Revista de Psiquiatría y Psicología Médica*, 1969(Oct), Vol. 9(4), 189-219.—A study of 140 patients suffering from degenerative brain diseases and focal and diffuse brain lesions yielded 42 cases classifiable as ideational apraxia, according to Morlaas' definition. The degree of impairment of various intellectual functions assessed by Morlaas' method led to the conclusion that ideational apraxia is not just a case of severe ideomotor apraxia but is a well-defined form of apraxia. While parieto-temporal lesions produce ideational apraxia most often, this site is not the one in which the various movements necessary in the utilization of an object originate. Focal brain lesions lead to ideational apraxia without ideomotor apraxia. In the course of senile decline both object permanence and ideational praxes deteriorate simultaneously, although there is no cause-effect relationship between them; rather, both appear to originate in changes in the utilization of spatial data. (English, French, & German summaries) (38 ref.)—*L. Zusne.*

4748. Jirout, J. **Neuroradiologie.** [Neuroradiology.] Berlin, E. Germany: Volk und Gesundheit, 1966. 830 p.—A monograph consisting of 2 major divisions: (a) the diagnosis of diseases of the skull and spine and of the brain and spinal cord, and (b) X-ray diagnosis of cranial and spinal traumata.—*I. D. London.*

4749. Krol', M. B. & Fedorova, E. A. **Osnovnye nevropatologicheskie sindromy.** [Main neuropathological syndromes.] Moscow, USSR: Meditsina, 1966. 490 p.—Describes the neuropathological syndromes often encountered in general medical practice, and presents an exposition of the pathology of structure and function underlying them.—*I. D. London.*

4750. Leicester, Jonathan; Sidman, Murray; Stoddard, Lawrence T., & Mohr, Jay P. (Massachusetts General Hosp., Neurology Service, Boston) **Some determinants of visual neglect.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1969(Dec), Vol. 32(6), 580-587.—Found a matching-to-sample technique to be a sensitive method of detecting and assessing visual neglect. 14 of 18 left hemisphere cases and all 6 right hemisphere cases showed contralateral neglect. The neglect was qualitatively the same in all Ss, but varied in severity. It was not shown whether neglect due to left hemisphere disease was quantitatively the same as that due to right hemisphere disease. Ss did not show neglect on every test, but only on those which they could not do correctly. The reasons for failure were the consequences of their lesions. Ss did other tests without any errors and without showing neglect. Neglect in particular tests was confined to either the left hemisphere or the right hemisphere

cases. Neglect did not have any simple relation to visual field defects by conventional testing. Neglect was most marked in the 1st weeks after a stroke, and tended to recede gradually. (19 ref.)—*Journal summary.*

4751. Létourneau, Jacques & Bélanger, David. (U. Montreal, Quebec, Canada) **Effets du méprobamate sur le rendement scolaire de paralytiques cérébraux.** [The effects of meprobamate on the school achievement of cerebral palsied children.] *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 274-278.—Evaluated the effects of meprobamate on the school achievement of 7-16 yr. old cerebral palsied children. 800 mg. of this drug were given every day to 11 experimental Ss over a 10-wk period. During that time, an equivalent group of 11 matched controls were treated with placebo. All Ss had previously received the same dosage of placebo during 10 wk., in order to have a double control and compare Ss with themselves. Data indicate that at the end of the academic year, the global school results of the athetoids of the experimental group were better. Such differences were not observed among the spastic children.—*English summary.*

4752. Mints, A. Ya. & Ronkin, M. A. **Reograficheskiye diagnostika sosudistykh zabolevaniy golovnoy mozga.** [Rheographic diagnostics of cerebral vascular diseases.] Kiev, USSR: Zdorov'ya, 1967.—Presents an exposition of the principles of rheography, rheoencephalography, and research methods. Major attention is directed to analysis of the rheographic curve, with special significance attributed to the form of the wave, its amplitude, the presence and salience of additional waves, continuity of the ascending and descending parts of the curve, and propagation time of the wave.—*I. D. London.*

4753. Pennell, Lillian A. (U. Florida) **The relationship of certain experiences to psychological adjustment in persons with spinal cord injury.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 232-233.

4754. Peralta, P., Sanjuanbenito, L., & Zafra, A. **Amiotrofias de origen parietal: A propósito de un caso.** [Amiotrophies of parietal origin: Regarding one case.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Apr), Vol. 28(2), 126-133.—Describes the clinical history of a 14-yr-old girl with muscular atrophy of the left limbs which coincided with a syndrome of intracranial hypertension provoked by a parietal tumor on the right side. Discussions follow on (a) muscular atrophy as an expression of a cortical lesion, (b) the relation between the lesioned parietal zone and muscular atrophy, (c) the relation between the morphology of the atrophy and the cortical localization of the lesion, and (d) the pathogenesis of atrophies. It is concluded that muscular atrophy expresses a deficit in trophic function, and is influenced by lobal connections with subcortical formations that are important to vegetative regulation.—*P. Hertzberg.*

4755. Ponces, J. & Aguilar Matas, J. (Centro Piloto Arcángel San Gabriel, Barcelona, Spain) **Las dispraxias de desarrollo.** [Developmental dispraxias.] *Revista de Psiquiatría y Psicología Médica*, 1969(Oct), Vol. 9(4), 275-294.—Presents descriptive statistics characterizing developmental dispraxias in 113 mentally retarded, cerebral palsy, and normal 4.11-9.10 yr. old children. Tests included those of dressing and undressing oneself, imitation, finger dexterity, and copying. A comparison of behavioral deficits among the 3 groups of Ss indicates

that different behaviors are differentially affected by mental retardation and by cerebral palsy. When deficits are present they are due to 3 factors: (a) learning difficulty of the same type as occurs in perceptual-motor retardation, (b) close relationship between synkinesias and motor ability in most praxic activities, and (c) the relationship between failures in praxic organization and organization of representational intelligence.—*L. Zusne.*

D. London.*

4760. Storey, P. B. (St. George's Hosp., London, England) **Brain damage and personality change after subarachnoid haemorrhage.** *British Journal of Psychiatry*, 1970(Aug), Vol. 117(537), 129-142.—261 patients followed as long as 6 yr. showed impairment in 41% and personality improvement, apparently due to a leucotomy effect, in 5%. Impairment appeared proportional to amount of brain damage and was common in middle cerebral artery aneurysms. Increased anxiety and irritability with loss of vitality was found as was classical frontal lobe syndrome. "Scores on the Benton Visual Retention Test and a modified Inglis Paired Associate Test were highly correlated with the presence of personality impairment but did not distinguish the mildly from the moderately impaired. The method of study, relying largely on the statements of other informants and largely excluding affective symptoms

from consideration, minimized the importance of pre-vious personality."—*R. L. Sulzer.*

Kh. **Klinicheskaya reoentsefalografiya: Novyi metod issledovaniya krovoobrashcheniya golovnogo mozga.** [Clinical rheoencephalography: A new method of studying cerebral circulation.] Moscow, USSR: Meditsina, 1967. 276 p.—A monograph, based on observations of more than 700 patients with cerebrovascular lesions, cerebral tumors, and other diseases of the brain and devoted to the theory, technique, application, and data of rheoencephalography.—*I. D. London.*

Brain Damage

4764. Alfonso-Fernández, Francisco. **La psicopatología de los traumatismos craneoencefálicos.** [The psychopathology of cranioencephalic traumas.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Apr), Vol. 28(2), 87-99.—Discusses the startling increase in traumatic accidents, elaborating 2 basic causes: (a) the increasing mechanization of the world, and (b) a predisposition in man (e.g., lack of emotional control and impulsiveness) which is widespread in a technological society. In regard to cranioencephalic traumas, 3 basic types of injury are examined: (a) alterations of consciousness, (b) intellectual traumas, and (c) traumatization of vital structures. Suggestions are made for rehabilitation.—*P. Hertzberg.*

4765. Baranov, V. A. **Zakrytye travmy golovnogo mozga.** [Closed injuries of the brain.] Moscow, USSR: Meditsina, 1966. 230 p.—Presents a critical and systematic treatment of the literature on closed cerebral injuries. It is concluded that the "severity of cranio-cerebral injury is determined by the damage [done] to the brain, its vascular and cerebrospinal fluid systems." Consideration of resultant mental disorders is subordinated to that of the neurological.—*I. D. London.*

4766. Brendler, S. J. & Selverstone, B. (Tufts U., Medical School) **Recovery from decerebration.** *Brain*, 1970, Vol. 93(2), 381-392.—Describes, in detail, 16 patients who recovered after showing the syndrome of midbrain dysfunction (decerebrate rigidity, coma, and dilated, fixed pupils). Preservation of corneal and tendon

reflexes and absence of severe hypotension appear to be favorable signs.—*W. A. Wilson.*

4767. **Freidmann, George.** (Inst. of Neurology, London, England) **The judgement of the visual vertical and horizontal with peripheral and central vestibular lesions.** *Brain*, 1970, Vol. 93(2), 313-328.—Ss set a luminous line to the apparent vertical and apparent horizontal in the light and in the dark. Patients with unilateral or bilateral loss of labyrinthine function were in most cases unimpaired compared to normals. A pathological deviation (always toward the side of the lesion) was present in $\frac{1}{3}$ of the patients with a cerebellopontine angle tumor and in almost all patients with unilateral brainstem damage, but no abnormality was seen after cortical or cerebellar lesions. Unilateral labyrinthectomy and acute brainstem damage may produce a deviation which regresses with recovery.—*W. A. Wilson.*

4768. **Goodglass, Harold; Barton, Melvin I., & Kaplan, Edith F.** (Veterans Administration Hosp., Boston, Mass.) **Sensory modality and object-naming in aphasia.** *Journal of Speech & Hearing Research*, 1968(Sep), Vol. 11(3), 488-496.—27 aphasics, 12 right-brain-injured, and 12 normal 33-71 yr. old Ss were presented with 16 objects for tactile naming, 16 for auditory naming, and 16 for olfactory naming. All objects were also presented for visual naming. Comparison between groups was based on the percentage difference in response latencies between naming by vision and naming by each of the other modalities. Analysis of variance showed no significant differences. The order of increasing difficulty of stimuli was the same for all groups, with aphasics showing consistently larger differences in latency than the other 2 groups. With few exceptions, the aphasics' naming scores were less than 1 standard deviation unit apart in all modalities. It is concluded that a modality nonspecific process intervenes between stimulus presentation and naming.—*Journal abstract.*

4769. **Grau Veciana, J. M.** (Hosp. Santa Cruz, Barcelona, Spain) **Las apraxias cinéticas.** [Kinetic apraxias.] *Revista de Psiquiatría y Psicología Médica*, 1969(Oct), Vol. 9(4), 265-274.—Only the originator of the concept of kinetic apraxias, D. Denny-Brown, has dealt with them extensively. In these apraxias, the patient's hands or feet are either attracted or repelled by objects. The clinical picture of kinetic apraxias is presented and their status regarding other types of apraxias is discussed.—*L. Zusne.*

D. London.*

4773. **Reitan, Ralph M.** (Indiana U., Medical Center, Neuropsychology Lab., Indianapolis) **Sensorimotor functions, intelligence and cognition, and emotional status in subjects with cerebral lesions.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 275-284.—Ss with traumatic, neoplastic, or vascular cerebral lesions composed 2 groups: 1 with sensorimotor functions which were relatively intact ($N = 31$) and 1 with functions which were relatively impaired ($N = 30$). This basis for selection resulted in an intact group that was somewhat younger, had a somewhat higher education, and had a higher proportion of patients with traumatic brain lesions. The group with impaired sensorimotor functions had a disproportionately higher number of Ss with cerebrovascular lesions. The groups were compared on various measures of intellectual and cognitive functions and on the MMPI. Results indicate that impairment of sensorimotor functions had a strong relationship to intellectual and cognitive measurements, with the impaired group being greatly inferior to the group with relatively intact sensorimotor functions. An influence in the same direction was noted on the MMPI variables, but the intergroup differences were not as great. (16 ref.)—*Journal abstract.*

4774. **Richardson, Alan & Cant, Rosemary.** (U. Western Australia, Nedlands) **Eidetic imagery and brain damage.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 47-54.—In a study of eidetic imagery among the retarded, E. M. Siipola and S. D. Hayden reported that 8 out of 16 brain damaged children possessed this form of imagery compared with only 1 out of 18 familial retardates. In a population of 151 normal primary schoolchildren R. N. Haber and R. B. Haber had found 12 children who were eidetikers. It was investigated whether a similar proportion of eidetikers would be found in another sample of brain injured Ss and whether the loci, duration, and extent of the neurological damage could be established. Results reveal that only 1 out of 62 brain injured Ss possessed eidetic imagery and only 3 out of 61 normal Ss. Findings are discussed in relation to the problem of diagnosing eidetic imagery and establishing its relation to brain injury and to the medical condition known as palinopsia. The problem of interpreting eideticism as functionally adaptive or maladaptive is considered. (21 ref.)—*Journal abstract.*

4775. Russell, Elbert W., Neuringer, Charles, & Goldstein, Gerald. (Veterans Administration Hosp., Cincinnati, O.) **Assessment of brain damage: A neuropsychological key approach.** New York, N.Y.: Wiley-Interscience, 1970. x, 167 p. \$12.95.

4776. Zimmerman, S. F., Whitmyre, J. W., & Fields, F. R. (Veterans Administration Hosp., Coatesville, Pa.) **Factor analytic structure of the Wechsler Adult Intelligence Scale in patients with diffuse and lateralized cerebral dysfunction.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 462-465.—WAIS protocols were obtained on 200 male patients with medically documented unilateral or diffuse cerebral damage. The intercorrelation matrix of the WAIS subtests was analyzed. 6 factors were rotated and the results were presented in relation to various brain-damaged groups. Results suggest that there are some rather important differences in factor structure among the 3 groups used. "Although the results of this study are somewhat tentative, the consistency between this study and others points to the need for serious consideration of (1) behavioral differences in the problem-solving capacities of patients with differential cerebral damage, and (2) specification of the degree to which verbal processes may affect supposedly 'performance' subtests."—E. J. Kronenberger.

Epilepsy

4777. Freemon, Frank R., Agnew, H. W., & Wilder, B. J. (Washington U.) **Electrical activity of the human hypothalamus and midbrain during sleep.** *Comprehensive Psychiatry*, 1970(Jul), Vol. 11(4), 356-360.—A 35-yr-old psychomotor epileptic underwent surgical implantation of recording electrodes in several subcortical sites including posterior hypothalamus and midbrain tegmentum. Cortical EEG and electric activity of subcortical structures were monitored during REM and NREM sleep periods. In the 1st REM period, hypothalamus showed 3/sec rhythmic activity, while in later REM periods bursts of distinct potentials temporally related to eye movements occurred in midbrain. The midbrain and hypothalamus observations in this S are joined with previous hippocampal recordings in other Ss in an attempt to compare human REM sleep with the REM sleep of laboratory animal species.—*Journal summary.*

4778. Fundyler, R. I. **Épilepsiya u detei i podrostkov.** [Epilepsy in children and adolescents.] Kiev, USSR: Zdorov'e, 1967. 196 p.—A manual for physicians.—I. D. London.

4779. Gilligan, Bernard S. (Alfred Hosp., Melbourne, Victoria, Australia) **Primary reading epilepsy.** *Medical Journal of Australia*, 1969(May), Vol. 1(20), 1025-1028.—Describes 3 cases of typical primary reading epilepsy, and describes the various theories concerning the etiology of this condition. From the literature, it would appear that the only constant factor precipitating attacks in all cases is the act of reading, rather than the content of the reading matter or the degree of concentration involved in reading. Presently, the most practical theory concerning the etiology of this syndrome appears to be the excitation of brainstem centers by repetitive proprioceptive stimuli occurring in the ocular muscles. Patients were a 15-yr-old boy, a 26-yr-old woman, and a 19-yr-old girl. The ability of a patient with primary reading epilepsy to continue reading through and

beyond an episode of jaw jerking without having a seizure is reported for the 1st time. Carbamazepine proved helpful, in combination with phenytoin sodium, in controlling jaw movements during reading.—*Journal summary.*

4780. Janz, D. **Die Epilepsien, Spezielle Pathologie und Therapie.** [The epilepsies, specific pathology and therapy.] Stuttgart, W. Germany: Georg Thieme, 1969. 554 p.—Presents a monographic exposition of the epilepsies, including detailed histories of the disease, and detailed data from EEG research. The disease is classified based on the clinical and neurophysiological characteristics specific to the various types. For each type the following aspects are considered: synonyms in the designation of similar types of seizures, history of the problem, clinical picture, EEG data, etiology, pathological anatomy, pathogenesis, biology, and therapy.—I. D. London.

4781. Ugryunov, V. M., et al. **Diagnostika i khirurgicheskoe lechenie travmaticheskoi épilepsii.** [Diagnostics and surgical treatment of traumatic epilepsy.] Moscow, USSR: Meditsina, 1967. 232 p.—Reports results of research based on observations of 1004 patients with traumatic epilepsy. Major attention is directed to the pathogenesis of epilepsy, in general, and to traumatic epilepsy, in particular, considered from the pathophysiological viewpoint. It is concluded that the epileptogenic focus in traumatic epilepsy not only triggers the epileptic attack, but simultaneously disorganizes the integrative activity of the brain.—I. D. London.

MENTAL RETARDATION

4782. ———. **Subsídios para um Plano Nacional de Combate à D. Mental (convênio ABDM-Cademe): V. Considerações do setor de psicologia.** [Subsidies for a national plan to combat mental deficiency (agreement between ABDM and Cademe): V. Considerations relating to the psychological sector.] *Revista Brasileira de Deficiência Mental*, 1970(Jan), Vol. 5(1), 36-40.—Presents results of a National Mental Retardation Institution survey (Brazil) which includes: (a) a breakdown of retardates by CA, MA, and IQ; (b) suggestions for improvement of services; (c) a national scale of priorities; and (d) recommendations for a minimal program. 50 institutions returned questionnaires, of these 29 had psychological services and 21 had a psychologist's services. Data show that more emphasis is needed on preschool retardates' care, teacher training, centers, and protected workshops for retardates over 14 yr. old. Recommendations concern: (a) research and definition of classifications for the mentally deficient and retarded; (b) public education campaign and subsidies for wide distribution of information; (c) helpers for remote areas; (d) regional, multidisciplinary centers; (e) a traveling educational team; (f) earlier, more differentiated diagnosis; (g) psychological examinations for all school repeaters; (h) national statistics gathering, and designation of a library and of a central point for evaluation of tests and data; and (i) updating of tests now in use.—K. Rissland.

4783. Adler, Leonore L. (American Museum of Natural History, New York, N.Y.) **The "Fruit-Tree Experiment" as a measure of retarded children's preferences of fruit trees under varied conditions of color availability.** *Journal of Psychology*, 1970(Nov),

Vol. 76(2), 217-222.—Replicated L. L. Adler's (see PA, Vol. 44:18290) previous "Fruit-Tree Experiment" which tested normal 5-12 yr. old children under 4 different conditions of color availability, the present study tested retarded children (I.Q. = 31-77). The fruit-tree drawings of the retarded Ss showed the same trends as those of normals, but to a lesser degree. As explanation an addition to the "attention deficiency theory," an "association deficiency theory of retardate imagination" was advanced.—*Author abstract.*

4784. Antonson, Florence G. (Florida State U.) **A study of the effect of cutaneous stimulation followed by reciprocal exercises on the functional level of passive crib-cases designated as mentally retarded.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5226.

4785. Bozarth, J. D. & Daly, W. C. (U. Arkansas, Rehabilitation Research & Training Center) **Three occupational groups and their perceptions of mental retardates.** *Mental Retardation*, 1969(Dec), Vol. 7(6), 10-12.—Examines the perceptions of 3 groups of employees in relation to the performance of a sample of institutionalized mentally retarded. Work supervisors, education and activities employees, and child care aides rated all 16-21 yr. old residential Ss with IQ's ranging from 40-80 on 14 variables, using the Likert Rating Scale. Results indicate highly significant differences between the groups of raters. Work supervisors tended to rate Ss' performance significantly higher than either of the other 2 groups. Child care aides in turn rated Ss' performance lower than work supervisors did, but higher than education and activities employees did.—*Journal abstract.*

4786. Browning, Philip L. (U. Wisconsin) **An analysis of counselor, client, and situational conditions in counseling the mentally retarded.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5227-5228.

4787. Conger, John J. (U. Colorado, Medical School, Denver) **Mental retardation as child development.** *Mental Retardation*, 1968(Dec), Vol. 6(6), 10-14.—Reviews the progress being made against mental retardation and related problems, and considers the present social climate as one which encourages further scientific, professional, and social advances, especially in the concept of maximal opportunity for the individual child. This concept plus the understanding that uniform opportunity is not necessarily equal opportunity, amounts to a social revolution which creates conditions favorable for an attack on the most critical social problems. The need for additional broadly based, interdisciplinary research on retardation in all areas from basic biology to sociological aspects is stressed. The retarded child has far more in common with other children than he has differences: his problems are mainly those of child development. It is concluded that the greater incidence of retardation in the economically deprived demands a more vigorous attack on the culture of poverty.—*Journal abstract.*

4789. Forehand, Rex & Baumeister, Alfred A. (U. Alabama) **The effect of auditory and visual stimulation on stereotyped rocking behavior and general activity of severe retardates.** *Journal of Clinical*

Psychology, 1970(Oct), Vol. 26(4), 426-429.—8 male institutionalized mental retardates (age range, 18-35 yr.) were observed in an experimental chamber using an ultrasonic motion detector to record the rate of general activity. In Exp. I visual-stimulation was associated with a reduction in general activity, and in Exp. II auditory stimulation led to an equivalent increase in rocking.—*E. J. Kronenberger.*

4790. Gayton, William F., Bassett, John E., & Bishop, John S. **The Harris revision of the Goodenough Draw-a-Man Test: Suitability for a retarded population.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 522-523.—Drawings from the Goodenough Draw-a-Man Test of 36 institutionalized mental retardates were scored independently by 2 clinical psychologists using both the Harris and Goodenough methods. The Harris method yielded higher correlations with IQ than the Goodenough method.—*E. J. Kronenberger.*

4791. Gettings, Robert M. **Mental retardation and the planning-programming-budgeting system.** *Mental Retardation*, 1968(Dec), Vol. 6(6), 24-26.—All Federal agencies are in the process of instituting a new budgetary procedure—the planning-programming-budgeting system (PPBS). PPBS stresses the need to consider both the short-term and long-range economic costs of various program alternatives in formulating public policy. The historical development, essential elements, applications in the field of mental health, and criticisms of PPBS are reviewed. Among the criticisms is that the explicit consideration of long-range costs of a program may increase the difficulty of convincing Congress of the need for particular spending activities. Also, 5-yr budgetary projections may fail to adapt to changes in social, economic, and political conditions. However, an advantage of estimating long-range costs in the field of mental retardation would be to demonstrate what has been neglected, thereby stressing the need for more financial assistance to mental retardation programs.—*Journal abstract.*

4792. González de Chávez, Manuel; Rodríguez Gorostiza, María I., & Orbe de Garay, María I. **Mecanismos obsesivos en debiles mentales.** [Obsessive mechanisms in mental retardation.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1969(Jan), Vol. 28(1), 30-36.—Presents an analysis of 6 obsessive Ss (1 female and 5 males 11-40 yr. old) who were mildly retarded. Ss were divided into 2 groups: iterative, with Ss under 20, and phobic, with Ss over 20. Although intelligence was considered to be a minor factor, the psychopathology of iterative Ss seemed related to their low IQ, while clinical pictures of phobic Ss seemed similar to those of obsessive Ss with normal intelligence. Anancastic manifestations seemed to be related to previous familial incidence. It was theorized that the lower intelligence and the more deficient the personality, the more automatic are anancasms.—*P. Hertzberg.*

4793. Joubert, Charles E. & Baumeister, Alfred A. (Southeastern Louisiana Coll.) **Effects of varying the length and frequency of response-stimulus interval on the reaction times of normal and mentally deficient subjects.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(1), 105-110.—Found RT to the 2nd of 2 closely spaced reaction stimuli to be dependent on the interaction of length of the interval between the 1st response and the onset of the 2nd stimulus ($R_1 - S_2$) and form of $R_1 - S_2$ interval

distribution. 5 $R_1 - S_2$ intervals were presented under 3 distributions: skewed left, skewed right, and symmetrical. In addition, 2 preparatory intervals (PI) were presented. Retarded Ss performed poorer than normal Ss on all measures; in addition, they were particularly handicapped with short $R_1 - S_2$ intervals. Improved performance on the short $R_1 - S_2$ intervals was found with increased frequency of these intervals. Relatively fast reactions (R_2) were associated with shorter PIs and there was a significant interaction between $R_1 - S_2$ interval and PI. Results support an expectancy interpretation of the psychological refractory period.—*Journal abstract.*

4794. Klaber, M. Michael. (U. Hartford) **Parental visits to institutionalized children.** *Mental Retardation*, 1968(Dec), Vol. 6(6), 39-41.—Statistically tested the assumption that parental visits to their institutionalized retarded children is inversely related to the distance of the parental home to the residential facility. The sample institutions were drawn from a densely populated area where the radius of aerial distance between parental home and facility never exceeded 90 miles. 116 residents who met certain criteria were tested. Findings show that although distance was given by parents as a reason for not visiting their children, parental failure to visit is based more on emotional rather than realistic reasons, distance being the most socially acceptable rationalization. A tentative conclusion is that parents are likely to visit when they feel that the child is making good progress and is happy. It is concluded that different geographic conditions would possibly yield different results.—*M. Walker.*

4799. Savino, Michael T., Kennedy, Ralph C., & Brody, Stuart A. (California Dept. of Rehabilitation,

Sacramento) **Using the nonprofessional in mental retardation.** *Mental Retardation*, 1968(Dec), Vol. 6(6), 4-9.—Traditional solutions to problems in the field of mental retardation have produced little more than temporary palliatives. It is stressed that more professionals must be trained. Hence, the use of indigenous nonprofessionals is proposed and exemplified as a partial solution to both the critical manpower shortage in the field of mental retardation and the problems of high-risk groups. These groups are both overrepresented in the incidence of mental retardation and underrepresented in service coverage. A most promising and validated new approach toward achieving adequate care of the retarded is to shift workload from highly trained professionals to less highly trained nonprofessionals working under close supervision and trained on the job by professionals. Indigenous nonprofessionals, particularly from lower socioeconomic groups, can be uniquely effective within their own subculture which is at a disproportionately higher risk. (25 ref.)—*Journal abstract.*

4800. Schaeffer, Mary L. & Shearer, William M. A **survey of mentally retarded stutterers.** *Mental Retardation*, 1968(Dec), Vol. 6(6), 44-45.—Surveyed a large state school for mentally retarded, and found that IQ scores for stutterers (7.6 of those having communicable speech) did not vary significantly from those of the nonstutterers. It is suggested that the mentally retarded stutterer be more carefully considered in the development of theory and therapy for the stuttering problem.—*Journal abstract.*

Learning & Motor Ability

4805. Holden, Edward A. (Edward R. Johnstone Training & Research Center, Bordentown, N.J.) **Unimodal and multimodal sequential information processing in normals and retardates.** *Journal of Experimental Psychology*, 1970(Nov), Vol. 86(2), 181-185.—24 adolescent educable retardates (R), 24 equal CA normals, and 24 equal MA normals reported the number of pulses in varying length sequences presented to the same (visual, auditory, or tactile) modality, alternated between 2 and among 3 modalities. Errors increased significantly in the order $R > MA > CA$, with increasing numerosities, and from the unimodal to multimodal conditions. There were no differences between the 2-modality and 3-modality conditions, from

which it is concluded that switching rate rather than the number of modalities defines the additional attention load. Since error increases from the unimodal to multimodal conditions were due primarily to underestimations, it is concluded that attention shifting interferes with input or storage of stimulus number. Compared with both normal groups, retardates underestimated relatively more than they overestimated. This confirms previous findings that retardates process incoming stimuli more slowly than normals.—*Journal abstract.*

4806. Maloney, Michael P. & Charrette, Harriett. (Pacific State Hosp., Pomona, Calif.) **Note on the effects of a gross-motor approach to training attention control on discrimination learning in mentally retarded Ss.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 41-42.—Hypothesized that a gross-motor approach to training (walking board) attention control would generalize to a 2-choice discrimination learning task. Results for 22 6-12 yr. old severely retarded institutionalized males support the hypothesis.—*Journal abstract.*

4807. Newfield, Melanie U. & Schlanger, Bernard B. (Houston Ear, Nose, & Throat Hosp. Clinic, Tex.) **The acquisition of English morphology by normal and educable mentally retarded children.** *Journal of Speech & Hearing Research*, 1968(Dec), Vol. 11(4), 693-706.—Developed a list of lexicon words which paralleled phonologically and morphologically the nonsense words used by J. Berko to study the acquisition of English morphology by 30 educable mentally retarded children and 30 normal children. Results indicate that significant quantitative differences existed favoring normal Ss in all the measures of morphology, measured by lexicon words and nonsense words. Nevertheless, the order of acquisition of morphology by retarded Ss, particularly in respect to nonsense words, paralleled that of normal Ss. With the normal and retarded Ss, an undefined time lag existed between the production of correct English morphological inflection forms with familiar words and the generalization of these forms to unfamiliar words, indicating knowledge of a morphological rule. Retarded Ss demonstrated greater inability than normal Ss studied in generalization from familiar to unfamiliar words.—*Journal abstract.*

4808. Peach, Walter; Monaco, Theresa; Blanton, Richard S., & Hurlburt, Golda. (Central Missouri State Coll.) **Effectiveness of programed instruction related to color discrimination for the trainable retardates.** *Central Missouri Synthesis on Mental Retardation*, 1968(Sep), Vol. 1(1), 21-26.—Investigated the effectiveness of programed instruction using the Edison Responsive Environment, an electronic typewriter consisting of an electronic keyboard, with the trainable mentally retarded. Of the 26 7-22 yr. old Ss, 3 groups were discerned. 1 group found the elementary color discrimination too difficult, the 2nd group showed definite improvement in their total score from the 1st to the 5th program presentation, and the 3rd group scored high on all 5 program presentations. Programed instruction involving the trainable did seem effective for a segment of the Ss.—*Journal abstract.*

4809. Raskin, Larry M. (Purdue U.) **Influence of amount of training and retention interval length on long-term perceptual memory in normal and educable-retarded children.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 191-194.—The influence of

perceptual memory on the perception of apparent movement was found to be the same for 36 educable-retarded children (EMRs) and 24 normals of the same MA following a short retention interval. However, in order for the memory effects to endure 24 hr., the EMRs needed much more training than did normals. The results are interpreted in terms of association perceptual learning.—*Journal abstract.*

4811. Schoenfeld, Lawrence S. (U. Texas, Medical School, San Antonio) **Effects of auditory stimulation on the performance of brain-injured and familial retardates.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 139-144.—Studied the effect of extraneous auditory stimulation on the performance of 36 10-17 yr. old familial and brain-injured retardates matched for CA, IQ, race, and sex. Results are discussed in reference to: (a) the value of the dichotomous medical diagnosis of brain-injured vs. familial retardates for prediction of performance, (b) the hypothesis that the so-called distractibility is an attempt by the brain-injured to sustain his normal level of stimulation, and (c) the advisability of using an enriched environment in teaching the brain-injured retardate. (17 ref.)—*Journal abstract.*

4812. Stevenson, Harold W., Friedrichs, Ann G., & Simpson, William E. (U. Minnesota, Inst. of Child Development) **Learning and problem solving by the mentally retarded under three testing conditions.** *Developmental Psychology*, 1970(Nov), Vol. 3(3, Pt. 1), 307-312.—Tested 125 educable retarded adolescents under 1 of 3 conditions: group, individual, or individual testing with a supportive adult present. All Ss were presented 5 tasks: paired-associate learning, discrimination learning, incidental learning, verbal memory, and anagrams. Except for incidental learning, where Ss performed better under individual testing, and in discrimination learning, where Ss performed better under group testing, level of performance was not influenced by testing conditions. Performance was more effective relative to normals paired-associate and discrimination learning than in verbal memory and anagrams.—*Journal abstract.*

Training & Vocational Rehabilitation

4813. Anant, S. S. (U. Lethbridge, Alberta, Canada) **The use of operant conditioning with the mental retardates: A report of a pilot experiment.** *Indian Journal of Applied Psychology*, 1969, Vol. 6(1), 15-21.—The training program of mental retardates using operant conditioning methods was found useful as shown by the improvement made by 19 of the 20 patients in the initial 7 wk.—*U. Pareek.*

4814. Barton, Elizabeth S., Guess, Doug; Gacia, Eugene, & Baer, Donald M. (Menwood Park Hosp., Leeds, England) **Improvement of retardates' mealtime behaviors by timeout procedures using multiple baseline techniques.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 77-84.—Reduced undesirable mealtime behaviors in a hospital cottage of 16 male retardates by contingent timeout procedures, i.e., removal of S from the room or 15-sec removal of S's meal tray, applied by ward personnel successively to 1

undesirable behavior after another, in a multiple baseline design. Undesirable behaviors were defined as stealing, using fingers inappropriately, messy use of utensils, and eating directly with mouth or eating spilled food. Timeout was applied to these behaviors in that order, and in each case led to a marked and useful reduction in the behavior throughout the group. As these undesirable behaviors were reduced, more appropriate mealtime behaviors emerged: as inappropriate use of fingers declined (under contingent timeout), messy utensil behavior increased; later, as messy utensil behavior declined (under contingent timeout), a defined category of neat utensil behavior increased. Ss' weights were monitored throughout the study and showed essentially no change.—*Journal abstract.*

4815. Cortzaao, Arnold D. (Aunland Training Center, Miami, Fla.) **An analysis of activity programs for mentally retarded adults.** *Mental Retardation*, 1968(Dec), Vol. 6(6), 31-34.—Reports on a 1968 nationwide study examining the current status of activity programs for mentally retarded adults in which a great need for such programs is revealed. Recommendations for their future programming are made. Results show that 1 of the major reasons for discharge from such programs is employment, indicating the success of these retardates in progressing to an acceptable working level. However, evaluation procedures for admission were found inadequate; the range and kind of activities in many programs were insufficient to attain stated goals; and the activity centers were not being adequately used as referral sources. It is recommended that these weaknesses be remedied and that inservice training institutes for staffs be conducted. Although the evidence supports the utility of such programs, their effectiveness is still questioned.—*M. Walker.*

4816. Daniels, Lloyd K. (Boston U., School of Education) **The relation between the self concept, perceived parental behavior, and vocational adjustment for mentally retarded young adults.** *Dissemination Abstracts International*, 1970(Jul), Vol. 31(1-B), 378-379.

4817. Monaco, Theresa M., Peach, Walter; Blanton, Richard S., & Loomis, Doris. (Central Missouri State Coll.) **Pilot study: Self care program for severely retarded girls.** *Central Missouri Synthesis on Mental Retardation*, 1968(Sep), Vol. 1(1), 8-20.—Each of 9 9-15 yr. old severely retarded girls served as her own control in a 16-day pilot program designed to determine if a control-led stimulus-response environment would reduce the number of verbal and/or demonstrated assists required by each S to complete a dressing operation. The conditions of a continuous to an intermittent schedule of reinforcement with a nutrient-verbal-physical contact type of reinforcement were used throughout. Results indicate that: (a) severely retarded girls do respond to a training program designed to modify dressing behavior; (b) demonstration either on or off the student facilitates acquisition of dressing skills; and (c) the use of positive reinforcement in the antecedent-consequences chain of events facilitates behavior modification.—*Journal abstract.*

4818. Peach, W. J. & Herbert, Mildred. (Central Missouri State Coll.) **Visual perception training for trainable retarded students.** *Central Missouri Synthesis on Mental Retardation*, 1968(Dec), Vol. 1(2), 4-8.—Investigated whether a training program in visual perception could significantly increase visual perceptual

functioning among 15 male trainable retarded Ss. A pretest, the Frostig Developmental Test of Visual Perception, was administered to determine the level of functioning in visual perception. Following analysis of pretest scores, a training program was instituted to increase visual perceptual skills. Posttest results indicate a positive increase for 10 Ss.—*Journal abstract.*

4819. Peach, W. J. & Thompson, Lincoln. (Central Missouri State Coll.) **Self care pilot study: Locker ordering project.** *Central Missouri Synthesis on Mental Retardation*, 1968(Dec), Vol. 1(2), 9-11.—Describes a pilot project related to the effectiveness of point reinforcement on the behavior of intermediate age retardates. For each ordered locker, 9 points were posted. These points were redeemed for 5¢ at the end of 1 mo. Effectiveness of the point reinforcement was variable.—*Journal abstract.*

4820. Pérez-Ramos, Aylid M. **La formación vocacional de adolescentes retardados mentales.** [Vocational formation of mentally retarded adolescents.] *Revista Brasileira de Deficiência Mental*, 1968(Apr), Vol. 3(2), 2-8.—Asserts that the success of vocational training in mental retardates depends on the proper assessment of 3 conditions: (a) the abilities, personality characteristics, and intellectual limitations relating to work; (b) opportunities for marketing work and acceptance of retardates in the community; and (c) habits, attitudes, and basic knowledge necessary for adaptation to life. The organization of a service in Venezuela for the vocational orientation of educable retardates is described with regard to objectives, programs, training methods, and the achievements of a sample apprentice group. Ss were 7 male and 9 female 14-21 yr. olds whose MA was 6-9 and who suffered disabilities of attention, memory, reasoning, perception, and various anxiety symptoms. Vocational training was the last step in the program which also included physical education, music, family living, optional religious training, primary reading, and writing. Vocational training included carpentry, weaving, agriculture, and gardening for male Ss, and sewing, hairdressing, and weaving for female Ss. It is concluded that Ss' achievements demonstrate the success of the program and the necessity for integration of vocational formation into total education.—*K. Rissland.*

4821. Watson, Luke S. (Case Western Reserve U.) **Applications of behavior-shaping devices to training severely and profoundly mentally retarded children in an institutional setting.** *Mental Retardation*, 1968(Dec), Vol. 6(6), 21-23.—Describes a toilet trainer the interior of which is bathed with light beams focused on photoelectric cells. Whenever a beam is broken a pulse is transmitted to a reinforcement dispenser, and a reinforcement is delivered. Although the machine works quite well—5 out of 8 retarded children used it daily over an 8-wk period when cued to go to the toilet—use of an automated sensing device attached to the S is recommended to signal the S to use the toilet trainer whenever an elimination response begins to occur and is not anticipated or detected by the behavioral engineer. It is suggested that a behavioral engineer, assisted by such devices, could shape and maintain retarded behavior more effectively and economically than several behavioral engineers alone. For electronic training devices to be really useful in modifying behavior, their operation must be perfected and be simple to operate.—*Journal abstract.*

4822. Whitman, Thomas L., Mercurio, J. R., &

Caponigri, Vicki. (U. Notre Dame) **Development of social responses in two severely retarded children.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 133-138.—Investigated the effect of reinforcement dependent on the social responses of 2 severely retarded withdrawn children. During 30 30-min training sessions food and praise were administered dependent upon the S's mutual participation in a ball-rolling and block-passing task. Both Ss showed a progressive increase in social interaction in a nontraining situation during this reinforcement period. After the reinforcement procedures were removed, social behavior decreased markedly. Response generalization to children not involved in training occurred.—*Journal abstract.*

PHYSICAL ILLNESS

4823. **Atakhanov, É. I., Kharat'yan, A. M., & Sapunova, N. V.** **Diagnostiche skie vozmozhnosti radiotelemetricheskogo issledovaniya pri khronicheskikh zabollevaniyakh kishechnika.** [Diagnostic possibilities of radiotelemetric examination in chronic intestinal diseases.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 173-177.—Includes details on the radiotelemetric procurement of data on temperature, pressure, and pH in different sections of the digestive tract.—*I. D. London.*

4824. **Bishop, Louis F. & Reichert, Philip.** (St. Barnabas Hosp., New York, N.Y.) **The interrelationship between anxiety and arrhythmias.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 330-334.—Discusses physical and emotional causes of arrhythmias and their effect upon cardiac states. Patients are often seen whose cardiac rhythm has been influenced by emotional reactions. Possible precipitating factors may include exertion, fatigue, various digestive disturbances, alcohol, tobacco, coffee, and allergy. It is important to learn in treating a patient with an arrhythmia whether anxiety or emotional problems are involved. Examples are included of such cases. Whether the more serious arrhythmias, i.e., ventricular fibrillation, can also be caused by anxiety is discussed. A case is noted of an apparently normal person in whom paroxysmal ventricular tachycardia was precipitated by an emotional upset. Because of the interrelationship between cardiac arrhythmia and anxiety, physicians should treat not only the basic heart condition, but also the anxiety which may have precipitated it. Cardiac drugs and various tranquilizers are listed which are effective in the treatment of arrhythmia. (17 ref.)—*P. McMillan.*

4825. **Cummings, Jonathan W.** (Veterans Administration Hosp., Washington, D.C.) **Hemodialysis: Feelings facts fantasies: The pressures and how patients respond.** *American Journal of Nursing*, 1970(Jan), Vol. 70(1), 70-76.—Discusses coping behavior of patients in stress situations produced by severe kidney disease and hemodialysis. The most important stress factors are seen to be social role disturbances, dependency, toxic factors (i.e., impairment of concentration ability and IQ functioning), and economic pressures.—*B. A. Stanton.*

4826. **Finnerty, Frank A.** (Georgetown U., Medical School) **Treatment of labile hypertension.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 339-341.—Classifies hypertensive patients into 3 groups of those having predominantly supratentorial, arteriosclerotic, or vaso-

spastic disease. Supratentorial Ss are described and a rational treatment approach is presented. Symptoms, i.e., excessive perspiration, dizziness, tachycardia, headaches, and fatigue are often mistakenly ascribed to high levels of arterial pressure. Physical examinations of such patients reveal signs of anxiety, including tachycardia, sighing respirations, and cold wet palms, but show no evidence of organic vascular disease. A case history is presented of a hypertensive female, and tables are included of characteristic features of various groups of hypertensive patients. It is concluded that "since the site of major abnormality in these patients seems to be supratentorial, the primary aim of therapy should be toward the relief of anxiety." The most effective drugs for use with these patients are amytal sodium and reserpine, although possible side effects of reserpine (gastric acidity and depression) prohibit its use with obese hypertensives or those with a history of peptic ulcer or mental illness.—*P. McMillan.*

4827. **Fisher, Albert L.** (LaCrosse Neuropsychiatric Clinic, Wis.) **Psychiatric aspects of the pre- and post-surgical patient.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 347-351.—Discusses the emotional and behavioral aspects of surgery, with special emphasis on the impact of the new surgical techniques that involve replacement and restorative procedures in contrast to those of excision and removal. It is suggested that the surgeon must utilize "psychologic acumen" to deal with the many somatic, perceptual, and psychosocial reactions that follow disturbances in the body image caused by surgery. Effects of different types of surgery on the security system of the patient are discussed. Better understanding of the relevant psychological processes in the surgical patient will help in the prevention of many postsurgical complications.—*P. McMillan.*

4828. **Foy, Audrey L.** **Dreams of patients and staff.** *American Journal of Nursing*, 1970(Jan), Vol. 70(1), 80-82.—Presents samples of the dreams related by patients and staff on a hemodialysis unit to illustrate how these dreams reflect the numerous fears and anxieties in a situation where life itself depends on the successful operation of a mechanical device.—*B. A. Stanton.*

4829. **Francis, Gloria M.** **Cancer: The emotional component.** *American Journal of Nursing*, 1969(Aug), Vol. 69(8), 1677-1681.—Persons who have cancer experience the same emotional stages—denial, anxiety, regression, depression, and realistic adaptation—as do those with other illnesses. Whether the patient adapts sooner, later, or never or whether he remains fixated in any 1 stage, depends not only on his personality, but also on how he views his diagnosis and on the attitudes of health personnel.—*Journal abstract.*

4830. **Gavrilenko, Ya. V. & Rybakova, G. S.** **Funktsional'naya proba na intensivnost' sekretsii solyanoi kisloty zheludochnymi zhelezami.** [Functional test of intensity of hydrochloric acid secretion by the gastric glands.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 170-172.—39 healthy persons and 30 with duodenal ulcer were Ss in a radiotelemetric study of the dynamics of some functions of the digestive tract.—*I. D. London.*

4831. **Kiely, Joseph M.** (Mayo Clinic, Rochester, Minn.) **Organic disease presenting as hyperventilation syndrome.** *Psychosomatics*, 1970(Jul), Vol. 11(4), 326-329.—Discusses the danger that symptoms of the hyperventilation syndrome "may mask the presence of serious underlying organic disease." 4 case histories are

presented of patients originally diagnosed as having symptoms of hyperventilation, who actually were suffering from pheochromocytoma, porphyria, brain tumor, and hypoparathyroidism, respectively. Treatment of the actual disease eliminated symptoms of hyperventilation. It is noted that the hyperventilation syndrome and acute anxiety attacks have identical symptoms and possibly a common biochemical mechanism. The most disturbing symptoms of patients with hyperventilation syndrome are related to the cardiovascular system, and "appear to be related to increased responsiveness of the β -adrenergic receptor site." Propranolol, an adrenergic blocking drug, has been reported to relieve such symptoms. (18 ref.)—*P. McMillan.*

4832. Long, Barbara. (Case Western Reserve U.) **Sleep.** *American Journal of Nursing*, 1969(Sep), Vol. 69(9), 1896-1899.—Reviews the 4 stages of sleep and discusses accompanying physiological changes, and discusses 5 causes of insomnia (physical, physiological, psychological, iatrogenic, and idiopathic). A demonstration is provided to delineate how knowledge concerning sleep stages, circadian rhythm, and insomnia may be used to predict the needs of hospitalized patients. (15 ref.)—*B. A. Stanton.*

4834. Nelson, Alice C. **How can you stand the crying?** *American Journal of Nursing*, 1970(Jan), Vol. 70(1), 66-69.—A pediatric nurse discusses awareness of a selective listening process which sorts out cries indicating fright, hunger, helplessness, and the need for support. It is emphasized that while the ability to cry is part of man's native endowment, the absence of a cry may indicate that the child has been deprived of mothering. In a hospital setting, the lack of crying on the part of the child may also indicate that the child is temporarily incapable of expressing his feelings in the absence of his mother who "...enables him to be himself."—*B. A. Stanton.*

4835. Plügge, Herbert. (3 Hospitalstr., Heidelberg, W. Germany) **Über die Arten der menschlichen Befangenheit.** [Concerning the types of human embarrassment.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1967(Jan), Vol. 15(1-2), 1-12.—Emphasizes embarrassment incurred as the result of a state of helplessness caused by physical illness and surgical procedures, especially myocardial infarctions and amputations. The estrangement of self and others and the neurotic-paranoid reactions which frequently occur during long periods of convalescence are discussed.—*B. A. Stanton.*

4836. Stamper, David A., Kinsman, Robert A., & Evans, Wayne O. (Fitzsimons General Hosp., Denver, Colo.) **Subjective symptomatology and cognitive performance at high altitude.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 247-261.—Describes further standardization of the General High Altitude Questionnaire (GHAQ) for use in quantifying the severity of acute mountain sickness. Results from 24 male volunteers show the questionnaire reliably reflects changes in symptom severity. The amount of decrement on a number of psychomotor tasks was directly related to the degree of severity of the subjective symptomatology of acute mountain sickness. Results also show

several conceptually clear symptom clusters of the GHAQ that appear to reflect different states of subjective symptomatology. (15 ref.)—*Journal abstract.*

4837. Studenikin, M. Ya. & Efimova, A. A. (Inst. of Pediatrics, Moscow, USSR) **Voprosy dolgosrochnogo prognozirovaniya nauchnykh issledovaniy v pediatrii.** [Problems of long-term prognostication of scientific research in pediatrics.] *Pediatrya*, 1970, Vol. 49(3), 5-11.—On the basis of currently developing interests in the Soviet Union, intensive pediatric research is expected there in the field of neuropsychic and autonomic functions, endocrine disorders, and hereditary defects.—*I. D. London.*

4838. Sudakov, K. **Emotsii i "bolezni veka."** [The emotions and the "disease of the century."] *Nauka i Zhizn'*, 1970, Vol. 37(3), 8-12.—Discusses the relationship between the emotions and cardiovascular diseases. While negative emotions are necessary, they should not be continuous and protracted. If even for only a short time, they should be interrupted by positive emotions. Otherwise, they become the source of serious, even irreversible, pathological states.—*I. D. London.*

4839. Tabolin, V. A., Fadeeva, M. A., Deshechikina, M. F., & Efimov, M. S. (2nd Moscow Medical Inst., USSR) **O patogeneze tak nazываемoi zatyannuvsheisya fiziologicheskoi zheltukhi novorozhdennykh.** [On the pathogenesis of so-called protracted physiological jaundice in neonates.] *Pediatrya*, 1970, Vol. 49(3), 11-17.—It is pointed out that the pathological condition is due to a delay in the development of the hepatic conjugating system frequently as a result of intracranial birth injury.—*I. D. London.*

4840. Timakov, V. A. & Fishzon-Ryba, Yu. I. **Radio-telemetricheskoe issledovanie kislotobrazuyushchei funktsii zheludka i vliyaniya na nee nekotorykh farmakologicheskikh sredstv.** [A radiotelemetric study of the acid-forming function of the stomach and the influence on it of several pharmacological agents.] In E. B. Babskii (Ed.), "Metody sbora i analiza fiziologicheskoi informatsii." (See PA, Vol. 45:Issue 3) 163-169.—130 patients with various gastric pathologies were Ss in a study of intragastric pH before and after the application of alkalis, hydrochloric acid, histamine, and atropine. Several important properties concerning their pharmacodynamics are disclosed.—*I. D. London.*

COMMUNITY SERVICES

4841. Brown, Frances G. (East Moline State Hosp., Ill.) **The zone concept in psychiatric care.** *American Journal of Nursing*, 1969(Sep), Vol. 69(9), 1923-1926.—Reports on regionalization-decentralization of mental health systems in Illinois. 8 geographic zones based on population have separate administrative jurisdictions. 6 zones have comprehensive mental health centers which provide for institutionalization, outpatient care, and 24-hr emergency facilities. In all zones, stress is placed on: (a) available treatment, (b) early treatment, (c) hospitalization locally, (d) involvement of patients' friends and relatives, (e) sufficient outpatient care for acute situations, and (f) cooperation between agencies and services. In addition, a combined 4-area community return unit has been established. Postinstitutionalized patients spend an average of 120 days at these units to facilitate readjustment to roles in a work-oriented society.—*B. A. Stanton.*

4842. Chappel, John N. & Daniels, Robert S. (U.

Chicago) **Home visiting in a black urban ghetto.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1455-1460.—Investigated 25 patients involved in a home visiting program during a 3-mo period in an area of Chicago which has a population of approximately 80,000, and is predominantly poor and black. Although home visiting by psychiatrists was viewed as being (a) expensive and time consuming, (b) of no real value to the patient, (c) a discomfort to the psychiatrist, and (d) a burden to the family of the patient under psychiatric care, these major disadvantages were proven to be out of proportion, if not entirely false. Results of this pilot project were viewed as successful in that a good patient-psychiatrist relationship rapidly materialized, and the patient's family was able to better adapt, understand, and help the situation of having the patient at home. In addition, it proved to be valuable training for the resident psychiatrists' efforts to better understand the community which they served. "Visits by a white professional into a black home can help increase understanding and to allay mistrust in addition to achieving necessary treatment goals."—P. R. Shibelski.

4843. Christmas, June J., Wallace, Hilda, & Edwards, Jose. (Harlem Hospital Center, New York, N.Y.) **New careers and new mental health services: Fantasy or future?** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1480-1486.—Examined the service, training, and research programs of Harlem Rehabilitation Center, a community based extension of the Harlem Hospital Center in New York City. The new paraprofessional residents are capable of handling the responsibility given them and are not just utilized by the psychiatrists to do the low-status tasks. In-service training is provided in 6 major areas: (a) core knowledge (human growth and development, etc.), (b) workshops (principles and practices of sociopsychiatric rehabilitation), (c) techniques of rehabilitative services in specialized areas, (d) self-development as a rehabilitation worker, (e) individual and group supervision, and (f) supportive services. Center services lie in 3 rehabilitative programs: the psychiatric, vocational, and continuing programs. Problems arising from this program include rivalry among clerical staff and workers, friction between patients and workers, and relationships with educational institutions. —P. R. Shibelski.

4844. Edgerton, J. Wilbert. (U. North Carolina) **Stabilizing support of mental health center programs: Testimony on Community Mental Health Centers Amendments of 1969.** *American Psychologist*, 1970(Oct), Vol. 25(10), 976-979.—Presents information in support of continued federal funding of community mental health centers. Emphasis is placed on the program features of consultation, education and research, evaluation, and the direct treatment services of a center's program. The necessity of support for preventive efforts, the use of indigenous manpower, and training in special problem areas (alcoholism and narcotic addiction) is also stressed. It is felt that effective functioning of community mental health centers requires a continuing pattern of federal support, especially for those activities which are not inherently self-supporting.—P. McMillan.

4845. Fishman, Jacob R. & McCormack, John. (University Research Corp., Washington, D.C.) **"Mental Health without Walls": Community mental health in the ghetto.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1461-1467.—Examined the problems of establishing a community mental health program using

as an example a sample ghetto community in Washington, D.C. Problems with techniques, location of facilities, communication between community leaders and professional staff members, continuity and participation are examined. Additional problems concerning fiscal cost of such a program are revealed. Several constructive solutions substantiated by the sample study are presented. Community involvement, the development of new careers for local community residents, decentralization of services, integration with other human services, consultation, and education are seen to be some of the effective ways of making such a mental health program a successful and helpful part of the ghetto community. (16 ref.)—P. R. Shibelski.

4846. Freyhan, Fritz A. (St. Vincent's Hosp. & Medical Center, New York, N.Y.) **Clinical aspects of the revolution in mental health services.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 1-7.—The broad objectives of community psychiatry are today firmly established, but who is treated, with what treatment, and by whom has not yet been optimally worked out.—D. Prager.

4847. Gabby, James I. & Leavitt, Alan. (California Medical Clinic for Psychotherapy, San Francisco) **Providing low cost psychotherapy to middle income patients.** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 210-214.—Describes the organization of a self-supporting, nonprofit clinic offering long-term psychotherapy to middle income patients. The treatment program is not subsidized and is supported by patient fees only, which average about 60% of private practice fees. Approximately 750 patients are seen each yr. There are no eligibility requirements, no limit on the number of sessions available, and no waits for appointments. Costs are minimized by using nonmedical psychotherapists wherever possible, utilizing part-time staff paid on an hourly basis, and simplifying administrative procedures. —Journal abstract.

4848. Greenblatt, Milton. (Tufts U., Medical School) **The troubled mind in the troubled city.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 8-17.—Because the problem of the troubled mind in the city is very great, it is necessary to designate a catchment area and a target population. The mass of citizens in the area must have representation, participation, and sanction in the mental health program. A survey of needs and resources is best accomplished by citizen-professional collaboration. A master plan for service to the mentally ill in each area must be developed with or by the citizens in collaboration with all other major health agencies responsible for total health planning. Services should be available promptly for the individual when he needs it, where he resides, and without threat of removal to remote impersonal institutions. Intensive research and evaluation should be continuous.—D. Prager.

4849. Jansen, Elly. (Richmond Fellowship, London, England) **The role of the halfway house in community mental health programs in the United Kingdom and America.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1498-1504.—Discusses various approaches to halfway house operations including the emergence of a philosophy arising from an experimental project in England. 2 different approaches to halfway house operation are presented: (a) the authoritarian model which still emphasizes the "management of the patient," with an impersonal and repressive setting; and (b) the newer type house which emphasizes the self-government

of the house and group effort involving all the patients. Various other aspects of the halfway house operations including intra- and interorganizational problems are discussed in relation to both the United States' and England's advancements and achievements in these community based programs.—*P. R. Shibelski.*

4850. Jones, Maxwell. (Ft. Logan Mental Health Center, Denver, Colo.) **From hospital to community psychiatry.** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 187-195.—Discusses the transition from hospital psychiatry to psychiatry practiced in the community, with particular reference to the role of the social worker. In this transition the hospital-based social worker has a problem with multiple responsibilities to the social work department, county team, ward, hospital, and especially the community outside the hospital. Since as yet no adequate training for community psychiatry exists, it would seem probable that the social worker rather than the psychiatrist should be the leader of a multidisciplinary team in the community. (15 ref.)—*Journal abstract.*

4851. Kaufmann, L. (Hôpital de Cery Clinique Psychiatrique Universitaire, Lusanne, Switzerland) **Die Handhabung der Beziehung zwischen Familie, Patient und Klinik.** [The management of relations between the family, patient, and clinic.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1969(Nov), Vol. 19(6), 221-229.—Argues that to operate a psychiatric clinic according to psychotherapeutic guidelines, special allowances must be made for the relation between the hospital, family and patient. Based on psychodynamic principles of the therapeutic community coupled with new theories about the families of psychotic patients, the manner in which treatment and family interventions interfere with one another is discussed. The family, considered as a psychodynamic system, is to be incorporated into the diagnosis and program of treatment. Typical familial behavior and problems of actual family therapy are pointed out.—*English summary.*

4852. Kluger, Jules M. (Westside Neighborhood Health Center, Denver, Colo.) **The uninsulated case-load in a neighborhood mental health center.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1430-1436.—Described the methods employed by a neighborhood mental health center in Denver, Colorado. The majority of the population of that area (some 50,000 people) were Mexican-Americans. Because of an administrative order, no waiting lists were allowed. There became a need for the staff to work for short-term goals (rather than long patient-therapist relations). It was also necessary for the staff to make themselves more readily available to their patient population and because of this a better patient understanding came about. While this type of quick turnover method may be relatively unique, the subsequent achievements by the staff seemed to be rewarding to them and helpful to their patient population.—*P. R. Shibelski.*

4853. Kolb, Lawrence C. (New York State Psychiatric Inst., New York) **Group dynamics and resolution of conflict in community psychiatric practice.** *Group Psychotherapy*, 1969, Vol. 22(3-4), 165-172.—Discusses the hostility which community-oriented mental health movements meet when beginning in a lower-class environment. Possible solutions to this inevitable problem are also discussed.—*A. Krichev.*

4854. Lehmann, Stanley. (New York State Dept. of Mental Hygiene, N.Y.) **Selected self-help: A study of**

clients of a community social psychiatry service. *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1444-1454.—Attempted to delineate characteristics of neighborhood service centers. The service centers (3 neighborhood storefront centers) were set up in conjunction with Lincoln Hospital in New York City, servicing an area with a population of approximately 350,000 people. In the 2-yr study, more than 7800 clients were treated, which is over 3 times the number predicted. Through the use of tables of compiled information, the average client families were found to be fatherless, new to the area, lower in occupational and educational levels, have some language handicap (Puerto Ricans only), and have come from within a 5-block radius of the service center. Reasons for coming to the centers were not primarily to have problems solved, but more because they were treated well (thus adding important psychological support). It is concluded that support and reassurance are quite effective and most important for a community mental health service such as this.—*P. R. Shibelski.*

4855. Powell, Thomas J. & Riley, John M. (U. Michigan, Social Work School) **The basic elements of community mental health education.** *Community Mental Health Journal*, 1970(Jun), Vol. 6(3), 196-202.—Discusses 5 elements necessary to an adequate plan for community mental health education, as follows: (a) population focus ("an attitude of active responsibility for all segments of a catchment area population requiring . . . mental health intervention"); (b) effective manpower utilization; (c) prevention (modification of pathogenic community conditions); (d) diverse methods of intervention (including social, educational, economic, somatic, and psychotherapeutic approaches to problem solution); and (e) multiple levels of intervention (the individual, group, organization, and community are equally appropriate objects of intervention). Methods of incorporating these elements into existing programs are discussed, and suggestions are made for relevant field experiences and conceptual approaches.—*P. McMillan.*

4856. Rosenthal, Alan J. & Langee, Harvey. (Stanford U., Medical Center) **The development of a service-oriented psychiatric program in a disadvantaged area.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1436-1443.—Reviews the progress of a small, service-oriented psychiatric program in a disadvantaged area of approximately 28,000 residents, 80% of which were members of minority groups (predominately black Americans). The major goals of the program were the establishment and maintenance of community control of the facility, allowing the progress to be utilized in the manner in which the community wished. 3 objectives of the program were to (a) provide psychiatric services as needed (although limited); (b) enhance psychiatric training, experience, and knowledge in this area; and (c) improve community-university relations through cooperation in this direct service. Evaluation after 18 mo. of service demonstrated that the program was well received and supported by the black community and its leaders. It is concluded that interest rather than financial backing is the essential factor contributing to success in small-scale programs of this type. (18 ref.)—*P. R. Shibelski.*

GERIATRICS

4857. Bower, Herbert M. (Willsmere Hosp., Melbourne, Victoria, Australia) **The first psychoger-**

iatric day-centre in Victoria. *Medical Journal of Australia*, 1969(May), Vol. 1(20), 1047-1050.—Describes the establishment of the Janet H. Bowen Day Centre in Melbourne, Australia for elderly patients suffering from functional or organic psychiatric disorders. The center may also be "used during a trial period after temporary discharge from the hospital to assess the degree of recovery achieved." Admission procedures, daily activities for patients, and diagnoses of mental disorders are presented. "The functions of the day center . . . emerges as an indispensable therapeutic weapon in geriatric psychiatry."—A. M. Berg.

4858. Epstein, L. J., Mills, C., & Simon, A. (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) **Antisocial behavior of the elderly.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 36-42.—If not for drunkenness, very few people 60 or over would be arrested in San Francisco. The Uniform Crime Reports seems to indicate that this is true for the entire United States. It is suggested that antisocial behavior subsides with age in the sense that issues and problems that produce anxiety are less common as one grows older, or perhaps visible antisocial behavior subsides with age in the same way as does narcotics addiction. Other possibilities are that as people get older they may learn how to stay out of trouble or that some of the motives for criminal behavior may have diminished in strength.—D. Prager.

4859. Kay, David W., et al. (U. Newcastle upon Tyne, England) **Mental illness and hospital usage in the elderly: A random sample followed up.** *Comprehensive Psychiatry*, 1970(Jan), Vol. 11(1), 26-35.—Examined "the type and duration of inpatient and residential care by a representative sample of old people living at home in Newcastle upon Tyne during a follow-up period of from 2½-4 yr. Comparisons are made of the hospital usage of those suffering from chronic brain syndromes," functional syndromes, and those without significant psychiatric abnormality. Unlike mentally healthy old people and the large majority of those with functional syndromes, the majority of the mentally deteriorated aged eventually need constant supervision which can usually be given only in some kind of institutional setting. In planning geriatric services adequate provision must be made for this section of the community.—D. Prager.

4860. Predescu, V., Pirée, S., & Damian, N. **Factori psihogeni in patologia psihiatrică a bătrâneții.** [Psychogenic factors in the clinical psychiatry of old age.] *Neurologia, Psihiatria, Neurochirurgia*, 1968(Mar), Vol. 13(2), 97-108.—Analyzes the role of psychogenic factors in geriatric psychiatry from the viewpoint of a multi-dimensional etiopathogenic concept. On the basis of the reaction-variation pattern, the determinant role of these factors in the psychogenic conditions of old age is emphasized. The clinical features of "involutive" and endogenous psychoses in old age and the pathogenic role of contributing and triggering psychogenic factors are discussed. As regards organic psychoses, reservations are expressed regarding the irreversible character of dementia, stressing the importance of psychogenic factors. (French, German, & Russian summaries) (74 ref.)—English summary.

vices: The report of a working party appointed by the Secretary of State for Education and Science: The Summerfield report. London, England: Her Majesty's Stationery Office, 1968. xix, 171 p. \$8.10.

4862. Ahlbrand, William P. & Hudgins, Bryce B. **Verbal participation and peer status.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 247-249.—360 4th-9th graders were used to examine the relationship between pupil participation in the question-answer cycle and sociometric status in the classroom. The results of a $6 \times 2 \times 2$ analysis of variance showed that high participators, regardless of grade level and sex, received more nominations for top scholar, leader, and popular class member, than did the low participators.—H. Kaczowski.

4863. Alper, T. G. & Kranzler, G. D. (U. Oregon) **Comparison of effectiveness of behavioral and client-centered approaches for behavior problems of elementary school children.** *Elementary School Guidance & Counseling*, 1970(Oct), Vol. 5(1), 35-43.—36 children randomly selected from a total population of referrals by teachers for high-rate "out-of-seat" behaviors were assigned to 1 of 4 treatment conditions: (a) client-centered counseling, (b) precision teaching (a behavioral approach), (c) attention placebo, and (d) no-treatment control. After a 4-wk treatment period, assessments were made using 4 outcome criteria: out-of-seat rate, sociometric choices, Self Social Symbols task scores, and arithmetic computation rates. No significant differences between treatment groups were found.—S. M. Amatora.

4864. Benne, Kenneth D. (Boston U.) **Authority in education.** *Harvard Educational Review*, 1970(Aug), Vol. 40(3), 385-410.—Both in popular and learned usage "authority" is a vague term. This state of affairs is discussed, together with the reasons for its neglect by philosophers and its disrepute among educators. 2 types of authority and their limitations are described: expert and rule authority. A 3rd type, anthropological authority, is proposed and discussed as a feasible way of describing the relationships which might obtain among students, teachers, and the community in a revitalized and more pertinent model of education.—C. M. Franks.

4865. Berlak, Harold. (Washington U.) **Values, goals, public policy and educational evaluation.** *Review of Educational Research*, 1970(Apr), Vol. 40(2), 261-278.—The growing politicalization of all aspects of American life coupled with an increasing retreat from rationalism and distrust of the intellectual is a direct challenge to applied social scientists to demonstrate that social justice is served by rational, empirically based policy decisions. The review then considers programmatic and public policy outcomes, the moral issues in public policy, and policy questions and elites. (2 p. ref.)—P. D. Leedy.

4866. Cohen, David K. (Harvard U.) **Politics and research: Evaluation of social action programs in education.** *Review of Educational Research*, 1970(Apr), Vol. 40(2), 213-238.—This review considers politics as a subject for evaluation, conceptual problems and their consequence for evaluation, and experimental approaches. Suggestions for an evaluation strategy are given. (2 p. ref.)—P. D. Leedy.

4867. Donato, Donald J. & Fox, Gary C. (U. Missouri) **Admissions officer, faculty, and student perceptions of their college environment.** *Journal of College Student Personnel*, 1970(Jul), Vol. 11(4), 271-275.—The

EDUCATIONAL PSYCHOLOGY

4861. ———. **Psychologists in education ser-**

amount, accuracy, and availability of information regarding college choice are important factors which influence how successful the college experience is for the student. An attempt was made to evaluate whether the admissions officer's perceptions of the campus climate as presented to the school counselor are congruent with the college's environment. Ss included 43 college students, 39 faculty members, and 10 admissions officers randomly selected from 1 2-yr and 1 4-yr college. They completed the College Characteristic Index which identifies intellectual and nonintellectual attributes of campus environments. Results indicate that the presentation of the college environment by the admissions officers differs significantly from that presented by students. Differences of perception were found in both the intellectual and nonintellectual climates of both colleges. Furthermore, a significant difference was found to exist between admissions officers' representation of campus press and faculty perceptions at 1 college but not at the other. It is argued that college admissions officers should have an accurate understanding of both faculty and student perceptions of their college environments. (15 ref.)—R. H. Mueller.

4868. Foley, Alice I. (Brighton Schools, Rochester, N.Y.) **A long way yet to go.** *New York State Education*, 1967(Apr), Vol. 54(6), 12-14.—Although the major emphasis is on the continuing inequality of educational opportunity available to the Negro child, needs of several other "disadvantaged" groups are reviewed, including mentally and physically handicapped, non-English-speaking children, and "slow learners" as well as children of affluent homes who are disadvantaged when deprived of rewarding and educationally valuable learning through experiences in a multiracial heterogeneous society. "If we put into practice what research tells us, we may change dramatically our approaches to the education of all children—not just the socially disadvantaged."—L. D. Summers.

4869. Hofman, John E. (Hebrew U. of Jerusalem, Israel) **Dimensionality (structure) of educational attitude referents: Note on validity of a criterial referents theory of attitudes.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 215-217.—According to a criterial referents theory of social attitudes, basic attitudinal dimensions such as progressivism and traditionalism in education tend to be independent because Ss differentiate concepts criterial to their own positions more extensively than noncriterial concepts. 79 undergraduates, 95 graduates, and 56 professors replied to a Likert-type scale of educational values and rated 13 educational concepts by the semantic differential technique. Data show that progressives do not appreciably differ from traditionalists in the way they structure both criterial and noncriterial concepts, though the domain and self-concepts gravitate toward their respective criterial referents.—*Journal abstract*.

4870. Hudgins, Bryce B. & Ahlbrand, William P. **Some properties of formal teacher and pupil communication.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 265-268.—Presents the results of an inquiry into the properties of formal communication in 9 junior high school English classes. The pupils spoke on the average 43.7% of the time. The typical student spoke twice: once on his own behest and once at the request of the teacher. Each utterance averaged 8.49 words (range, 0-382 words).—H. Kaczowski.

4871. Kashina, M. P. & Chekharina, E. M. (Eds.)

Narodnoe obrazovanie v RSFSR. [Popular education in the Russian Soviet Federated Republic.] Moscow, USSR: Prosveshchenie, 1970. 357 p. 1 R. 32 K.

4872. McGowan, B. & Liu, P. Y. (U. California, Los Angeles) **Creativity and mental health of self-renewing women.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(3), 138-146.—Ss were 168 middle-aged women (average age = 39.5 yr.) enrolled in a university daytime class designed to help women find satisfying educational, vocational, or volunteer involvements. 16 PF scores revealed that they were highly creative and intelligent as compared with the standard for adult women; and above the pooled sample of scientific researchers in biology, physics, and psychology. Self-renewing women are described as "self-sufficient extroverts" in contrast with Cattell's description of creative people as "self-sufficient introverts."—S. M. Amatora.

4873. Morgan, Thomas D. (State University Coll. New York, Buffalo) **An existentialist analysis of the nature of man implied in L. Urwick's "Elements of administration" and Warren G. Bennis' and Philip E. Slater's "The temporary society."** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5202-5203.

4874. Ross, Samuel B. (Edwin Gould Foundation for Children, New York, N.Y.) **Rx-child care.** *Journal of Learning Disabilities*, 1968(Jun), Vol. 1(6), 354-357.—Describes a preschool through 8th grade boarding school which attempts to provide a total environment.—D. Hall.

4875. Stake, Robert E. (U. Illinois) **Objectives, priorities, and other judgment data.** *Review of Educational Research*, 1970(Apr), Vol. 40(2), 181-212.—Several different kinds of judgment data are identified. Personal value commitments, educational aims, goals, objectives, priorities, norms, and standards are judgment data. Evaluation theory and procedure is discussed. Methods of gathering judgment data are reviewed. Methods of reporting, utilization, and testing judgment data are all discussed. (7 p. ref.)—P. D. Leedy.

ATTITUDE & ADJUSTMENT

4876. Apostol, Robert A. (U. North Dakota) **Personality type and preferred college subculture.** *Journal of College Student Personnel*, 1970(May), Vol. 11(3), 206-209.—Attempted to determine whether any relationship exists between student personality types and the students' preferred college subculture. It was hypothesized that no such relationship exists. A total of 993 students completed the College Student Questionnaires. They were classified into personality types on the basis of the choice of major field. Instruments used to determine this were the Clark-Trow Typology and Holland's Personality Types. Results indicate that males and females differ significantly in their choices of subculture membership. The null hypothesis was rejected and the findings for men included that realistic personality types tend to prefer the vocational subculture in college; enterprising types tend to avoid the vocational subculture, while artistic types tend to prefer the academic subculture. For women, social types tend to avoid the academic subculture; enterprising types tend to avoid the vocational subculture, but are attracted to the academic subculture.—R. H. Mueller.

4877. Barratt, Ernest S. & White, Robert. (U. Texas,

Medical School, Galveston) **Impulsiveness and anxiety related to medical students' performance and attitudes.** *Journal of Medical Education*, 1969(Jul), Vol. 44(7), 604-607.—Related impulsiveness and anxiety to medical students' academic performance and attitudes toward fellow students, medical school, and life goals. Data are based on: GPAs, Medical College Admission Test (MCAT) scores, interviews in which Ss expressed various attitudes, retest reliability for the Barratt Impulsiveness scale and the Institute for Personality and Ability Testing Anxiety scale for a 3-yr period, summaries of interviews with Ss' peers and professors, and Clyde Mood scale scores. Results show that although there were no differences in mean MCAT scores between Ss with varying degrees of impulsiveness and anxiety, there were differences in GPA; e.g., Ss with high impulsiveness and high anxiety had lower GPAs and all sought psychiatric help during the 3 yr. of the study. It is concluded that, as suggested in previous studies, "nonintellectual factors relate to performance in medical schools" and that "it may be possible to identify some students with potential problems early in their medical school programs."—*M. Maney.*

4878. Bradshaw, George D. & Gaudry, Eric. (U. Melbourne, Victoria, Australia) **The effect of a single experience of success or failure on test anxiety.** *Australian Journal of Psychology*, 1968(Dec), Vol. 20(3), 219-223.—Randomly assigned junior high school pupils classified on attainment in English, sex, and socioeconomic area of school to 1 of 2 treatments: a difficult vocabulary test which they were likely to fail and an easy vocabulary test. The failing group scored significantly higher than the successful group in the Text Anxiety Scale for Children which was administered immediately after the treatments. Significant differences were also found for level of attainment, for sex and for the interaction of treatment with level of attainment. Results are discussed in relation to earlier research findings that streaming practices in schools tend to be associated with higher test anxiety in the lower streams.—*Journal abstract.*

4879. Cannon, Thomas M. (Texas Technological U.) **The Wechsler Intelligence Scale for Children as a predictor of adjustment of first grade students.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 143-144.

4880. Devi, Girish B. (Ravenshaw Coll., Cuttack, India) **A study of anxiety in men and women college students.** *Psychological Studies*, 1969, Vol. 14(1), 35-38.—The statistics observed closely correspond to those observed by Sinha. The data indicate that the female Ss had significantly more anxiety than the male Ss.—*U. Pareek.*

4881. Elton, Charles F. **Personality of low income males: College versus noncollege.** *Journal of College Student Personnel*, 1970(May), Vol. 11(3), 210-212.—Compared the personality characteristics of high school seniors eligible for federal financial aid who attend college with those eligible for such assistance who decide to forego attending college. A sample of 106 college male freshmen completed the Omnibus Personality Inventory as did 39 males who were eligible for financial aid but who chose not to attend college. 5 factors were identified; however, no significant differences were obtained between the 2 groups on the basis of their personality test scores. Thus, the "quest for discovering personality differences between low income

high school males choosing college and those making other choices does not appear to be a promising one."—*R. H. Mueller.*

4882. Feather, N. T. (Flinders U., Bedford Park, South Australia) **Educational choice and student attitudes in relation to terminal and instrumental values.** *Australian Journal of Psychology*, 1970(Aug), Vol. 22(2), 127-144.—Reported 2 studies in which it was found that: (a) 463 Australian students' choice of school at a university was related to the relative importance assigned to different terminal and instrumental values as assessed by Rokeach's Value Survey, and (b) that Ss' attitudes toward controversial social issues as assessed by the semantic differential were also related to some of these values. Results were compared to those of a sample of students from a university in the United States and the differences are related to M. Lipset's discussion of value patterns in different democracies. Results also indicate significant relationships between the different attitudes and between the attitudes and dogmatism. It is suggested that these relationships might be a function of a dogmatic style involving a cluster of values concerning traditional authority. (18 ref.)—*Journal abstract.*

4883. Gaudry, Eric & Bradshaw, George D. (U. Melbourne, Victoria, Australia) **The differential effect of anxiety on performance in progressive and terminal school examinations.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 1-4.—Administered an intelligence test and the Test Anxiety Scale for Children (TASC) to students in 14 secondary classes early in the school year. Marks in mathematics in both progressive and terminal examinations were collected and analyzed as a function of anxiety, intelligence and method of examining. The experimental hypothesis was that high test anxious Ss would perform relatively better under the less stressful conditions of progressive examining than under terminal examining when compared with low anxious Ss in the same class. The Anxiety X Method-of-Assessment interaction was significant and in the predicted direction. Implications for school examining practices are discussed.—*Journal abstract.*

4885. Grant, Harold W. & Eigenbrod, Frederick A. (Auburn U.) **Behavioral changes influenced by structured peer group activities.** *Journal of College Student Personnel*, 1970(Jul), Vol. 11(4), 291-295.—This exploratory study investigated whether specific behavioral changes could be achieved by structured peer group membership and activities. The Myers-Briggs Type Indicator was administered to a group of residence hall students, each completing the inventory twice. The 1st time they were asked to respond as they presently viewed themselves (actual type) and the 2nd time they were asked to respond as they would like to be (ideal type). The results of 4 groups were considered in terms of the degree of intuitive, feeling, and thinking behavior they manifested. The study affirms that students change regardless of what one does to them or for them and that the problem remains, of directing this change so as to maximize the group and achievement of each student.—*R. H. Mueller.*

4886. Hawkes, Thomas & Koff, Robert H. **Difference**

in anxiety of private and inner city public elementary school children. *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 250-259.—Presents normative data and a content item analysis of a general anxiety scale that was composed of items from the Children's Manifest Anxiety scale and the General Anxiety Scale for Children. This general anxiety scale was administered to 211 middle and upper-middle class children and 249 Negro children from a lower socioeconomic background. Significant statistical differences were found by school (representative of social class), sex, and grade.—H. Kaczkowski.

4888. Lynch, Ann Q. (U. Florida) **Perception of peer leadership influence.** *Journal of College Student Personnel*, 1970(May), Vol. 11(3), 203-205.—Discusses the relationship between the results of a 7-point scale of 5 dimensions regarding perceptions of advisors in a residence hall, a follow-up questionnaire, and the scaled difference between predicted and actual GPA scores. A total of 676 freshmen residence hall females participated. Pearson product-moment correlation coefficients were computed. If the advisor was rated highly as one who conveyed behavior and feelings appropriate to a "good influence," generally showed respect for rules and the upholding of standards, expressed positive attitudes toward the campus community, had established her own goals and was generally moving toward them, and seemed prepared in her role as advisor, the freshman achieved higher grades in relation to her ability. It appears that advisors may play deciding roles in helping new students adjust and that they are effective to the extent that students perceive them as approachable.—R. H. Mueller.

4893. Morris, Larry W. & Liebert, Robert M. (Middle Tennessee State U.) **Relationship of cognitive and emotional components of test anxiety to physiological arousal and academic performance.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 332-337.—The relationship of cognitive (worry) and emotional (emotionality) components of test anxiety to pulse rate, performance expectancy, and actual examination grades was determined for samples of both high school (N = 91) and college (N = 95) students. For both samples, 2 of the 3 major predictions received support: (a) worry was found to be more highly negatively related to examination grades than was

emotionality or pulse rate, and (b) worry was more highly negatively related to expectancy than was emotionality. However, pulse rate was no more highly related to emotionality than to worry, suggesting that questionnaire and direct measures of autonomic arousal are less closely related than has been generally assumed.—*Journal abstract.*

4901. Rose, Harriett A. & Elton, Charles F. (U.

Kentucky) **Personality characteristics of transfer students.** *Journal of College Student Personnel*, 1970(Jul), Vol. 11(4), 266-270.—Noting a lack of knowledge concerning personality traits of college students who transfer from 2-yr colleges as compared to those who transfer from 4-yr colleges, an attempt was made to determine if any differences do, in fact, exist. The Omnibus Personality Inventory was administered to 97 female and 173 male transfers from 2-yr colleges, and 255 female and 203 male transfers from 4-yr colleges. The personality factor scores obtained were found to be highly similar, including such factors as Scholarly Orientation, Nonconformity, and Masculinity-Femininity. In addition, the results indicate that there is no justification for special orientation programs exclusively for transfer students from 2-yr colleges.—*R. H. Mueller.*

4902. **Roskamp, Hermann.** (17 Meistersingerstr., Stuttgart, W. Germany) **Arbeitsstörungen als Ausdruck situationsspezifischer Konflikte bei Studenten.** [Work disturbances as an expression of specific situational conflicts in students.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1969(Nov), Vol. 19(6), 256-259.—For a number of students born during World War II, the approaching matriculation examinations lead to an acute identity crisis which had previously been kept latent thanks to the particular living conditions of college or university students. The crisis is often signaled by the unravelling of work disruptions in the final stages of the study program. The return of the father from the war into a previously fatherless family and the conflicts resulting from this appears to be the genetic basis for the identity conflicts arising later.—*English summary.*

4903. **Smith, Stuart L.** (McMaster U., Hamilton, Ontario, Canada) **School refusal with anxiety: A review of sixty-three cases.** *Canadian Psychiatric Association Journal*, 1970(Jun), Vol. 15(3), 257-264.—Reviews data concerning 63 cases of school refusal, characterized by anxiety alone, obtained from the 1958-1964 files of the children's division of a London hospital. Results indicate that school refusal (a) occurred most often between 11 and 12 yr., with a smaller but significant peaking at ages 5 or 6; (b) showed a higher incidence in the youngest Ss in a family; and (c) was characterized by 3 syndromes (separation anxiety in younger Ss, school phobia in older Ss, and depression or withdrawal in adolescents). Of the total group, 24 Ss were treated on an outpatient basis, 12 hospitalized, and 15 placed in other schools. Drugs were used occasionally. 45 Ss had returned to school and still remained at the time of this study, although 3 of the 7 Ss over 13 who returned remained unimproved. (French summary)—*P. McMillan.*

4905. **Trowbridge, Norma.** **Effects of socio-economic class on self-concept of children.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 304-306.—The self-concept of pupils in 64 elementary school classrooms (equally divided among those whose teachers had special training in human relations and those who did not) was appraised by the Coppersmith Self Esteem Inventory. The analysis of variance of the scores suggests that the self-concept of students whose teachers had special training was significantly higher than the control students.—*H. Kaczkowski.*

4906. **Trubowitz, Julius.** (Columbia U.) **The effect of an activity group program on interracial attitudes.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 470.

4907. **Weston, Peter J. & Mednick, Martha T.** (Howard U.) **Race, social class and the motive to avoid success in women.** *Journal of Cross-Cultural Psychology*, 1970(Sep), Vol. 1(3), 284-291.—The motive to avoid success was compared for black and white college women and 2 social class levels through the response to TAT verbal cues. Black women showed less motive to avoid success than white women for Ss at 2 schools and for 2 verbal cues. Social class differences were not found.—*A. Krichew.*

4908. **White, Kinnard & Owen, David.** **Locus of evaluation for classroom work and the development of creative potential.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 292-295.—48 boys in a visual art course were used to test the hypothesis that creative potential can be enhanced through self-evaluation. Single factor multivariate analysis of the data support the hypothesis.—*H. Kaczkowski.*

4909. **Wilson, Ronald S. & Dollar, Robert J.** (Trinidad State Junior Coll.) **Student, teacher, and administrator perceptions of the junior college environment.** *Journal of College Student Personnel*, 1970(May), Vol. 11(3), 213-206.—Concerned about the paucity of studies reporting data relevant to the assessment of the junior college environment, this study investigated the differences in perceptions of such a campus among administrators (N = 12), faculty teaching transfer courses (N = 30), students majoring in transfer programs (N = 50), faculty teaching vocational-technical courses (N = 27), and students majoring in vocational-technical courses (N = 50). The College and University Environment Scales (CUES) was used to assess the Ss' perceptions of the college environment in terms of 5 scales—practicality, community, awareness, propriety, and scholarship. The findings lend support to the assertion that there is a major emphasis on practicality in contemporary American higher education. In addition, there is general agreement among faculty, students, and administrators that knowing the right people, being in the right groups, and doing what is expected is an important aspect of their environment. However, there is no evidence to suggest that they agree on their definitions of what the environment should be like.—*R. H. Mueller.*

TESTING

4910. **Adams, Raymond S.** (U. Missouri) **Duration and incident frequencies as observation indices.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 669-674.—Trained coders analyzed 32 videotaped lessons in social studies and arithmetic. 16 tapes were from Grade 10: 8 each from Grades 1 and 6. For each variable class rho's for frequency of use and total duration were obtained for each lesson. Results indicate high correlations between the 2 for 7 classes of variables in 32 lessons. (21 ref.)—*N. M. Chansky.*

4913. Carver, Ronald P. (American Inst. for Research, Washington, D.C.) **Analysis of "chunked" test items as measures of reading and listening comprehension.** *Journal of Educational Measurement*, 1970(Fal), Vol. 7(3), 141-150.—Developed a new type of test item which requires Ss to recognize groups of words, i.e., chunks, whose meaning had been changed from that in the original reading or listening passage. In Exp. I, involving 52 undergraduates and 20 test variables, individual differences on the chunked reading test correlated .68 with a multiple-choice alternate form. In Exp. II with 34 undergraduates, the decrease in listening comprehension due to increased speech rate as measured by the chunked items was roughly parallel to the decrease as measured by the multiple-choice questions. Data are interpreted as providing evidence for the validity of the chunked items as measures of comprehension. However, other results suggest that the chunked items may be less dependent upon grammatical and vocabulary knowledge and more sensitive to within individual changes in comprehension as compared to the traditional multiple-choice question. (21 ref.)—*Journal abstract*.

4914. Deb, Maya. (U. Calcutta, India) **A factor analytical study of an engineering aptitude test.** *Journal of the Indian Academy of Applied Psychology*, 1969, Vol. 6(1), 25-26.—Factor analysis of a 40-item engineering aptitude test developed to measure mechanical interest and comprehension, observation power with mechanical bent of mind and logical reasoning, knowledge of elementary scientific laws, physical instruments and application, and mathematical comprehension and application showed 1 dominant factor, named "mechanical reasoning."—*U. Pareek*.

4915. Dielman, T. E. & Wilson, Warner R. (U. Illinois, Lab. of Personality & Group Analysis) **Convergent and discriminant validity of three measures of ability, aspiration-level, achievement, adjustment and dominance.** *Journal of Educational Measurement*, 1970(Fal), Vol. 7(3), 185-190.—Employed self- and peer-reports on 75 undergraduates as 2 measures of each trait in a multitrait-multimethod matrix. Aspiration level was measured by the EPPS Nach scale, dominance by the EPPS Dom scale, achievement by cumulative college grade point ratio, ability by the Ohio State Psychological Examination (OSPE), and adjustment by the Bell Adjustment Inventory. Of the paper and pencil instruments, only the OSPE and EPPS Dominance scale exhibited satisfactory convergent validity. No measure met all the requirements of discriminant validity. The desirability of establishing adequate validation evidence prior to using "trait" measures in studies relating theoretical variables was emphasized. (16 ref.)—*Journal abstract*.

4925. Meuris, Georges. (U. Louvain, Belgium) **The structure of primary mental abilities of Belgian secondary school students.** *Journal of Educational Measurement*, 1970(Fal), Vol. 7(3), 191-197.—Conducted a factor analysis of a test battery given to 3943 12-18 yr. old Belgian secondary school students and based it on L. L. Thurstone and T. G. Thurstone's work on the primary mental abilities. The analysis provided construct validity evidence for the existence of verbal, numerical, spatial, and reasoning abilities in the Belgian sample and confirmed the theoretical conceptions guiding the development of the test battery. An examination of the factorial organization of these mental abilities for different age groups reveals a progressive differentiation of abilities with age. There is also evidence that intensive academic specialization improves performance in the abilities required by these specializations.—*Journal abstract*.

4926. Pollock, Marion B. (California State Coll., Long Beach) **Mood-altering substances: A behavior inventory.** *Journal of Educational Measurement*, 1970(Fal), Vol. 7(3), 211-212.—Describes a test designed to evaluate the knowledge and actual practices of high school graduates regarding mood altering substances, i.e., alcohol, drugs, tobacco, etc. The test contains 20 multiple-choice items concerning present practices, and 60 items concerning knowledge about use and effects of the various substances. The test can be used as early as the 10th grade and requires from 20-40 min. for administration. Validity, reliability, and standardization data are cited.—P. McMillan.

4927. Reid, J. Christopher. (U. Missouri) **Printed comments with item analyses.** *Journal of Educational Measurement*, 1970(Fal), Vol. 7(3), 159-160.

4928. Sherrill, David; Horowitz, Bernard; Friedman, S. Thomas, & Salisbury, J. L. (Syracuse U.) **Seating aggregation as an index of contagion.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 663-668.—Studied the contagion of cheating behavior in a group of 193 undergraduates. S attrition across time was 38%. Ss received 3-hr exams. E recorded Ss' scores but made no mark on the paper. Self-scoring was done in the

session following each examination. Cheating increased from Test 1 to Test 2 but decreased from 2 to 3. Cheaters tended to sit together.—N. M. Chansky.

4929. Sirotnik, Ken. (U. California, Los Angeles) **An investigation of the context effect in matrix sampling.** *Journal of Educational Measurement*, 1970(Fal), Vol. 7(3), 199-207.—Tested the assumption that an examinee's response to an item is independent of the context in which the item occurs. Responses of examinees to a population of items were compared with the responses of examinees to item samples. Matrix sampling mean and variance estimates for verbal, quantitative, and attitude tests served as dependent variables to test for differences between the "context" and "out-of-context" groups. The estimates obtained from both treatment groups were compared with actual population values. No significant differences were found between treatments on matrix sample parameter estimates for any of the 3 types of tests.—*Journal abstract*.

4930. Varhelyi, Emory A. (Fordham U.) **The relationship of test and general anxiety, difficulty of task, and experimental instructions to test performance.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5305.

4931. Washington, Ernest D. & Teska, James A. (Inst. for Research on Exceptional Children, Champaign, Ill.) **Correlations between the Wide Range Achievement Test, the California Achievement Tests, the Stanford-Binet, and the Illinois Test of Psycholinguistic Abilities.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 291-294.—Presents correlation coefficients for 96 pre- and early elementary school children between the Stanford-Binet, Illinois Test of Psycholinguistic Abilities, Wide Range Achievement Test, and California Achievement Tests (Lower Primary). The 2 achievement tests were highly correlated with each other ($Mdn = .80$) and the high (.89) correlation between Wide Range Reading scores and California Total Battery indicates the possibility of using the Wide Range reading score as a quick estimate of general achievement. The Binet Mental Age and ITPA Total Language Age were highly correlated with each other and about equally correlated with achievement variables, while only 2 of the ITPA subtests, Auditory-vocal Automatic and Auditory-vocal Association were moderately correlated with the Binet and achievement variables.—*Journal abstract*.

4932. Williams, Robert L. (Washington U.) **Black pride, academic relevance and individual achievement.** *Counseling Psychologist*, 1970, Vol. 2(1), 18-22.—Asserts that blacks and whites have different orientations to life, different "psyches," and different linguistic idioms. Therefore, middle-class-oriented measures of intelligence and achievement suitable for the whites are unsuitable for the blacks. White clinicians, moreover, have not experienced black culture, thereby barring them from diagnosing and treating them. The blacks suffer from "niggerosis." "Niggerosis deals with real problems, like not having enough money, fighting roaches, frozen water pipes, rats and other symptoms produced by racism."—N. M. Chansky.

SPECIAL EDUCATION

4933. Blanchard, Irene; Bowling, Don, & Roberts, R. Lincoln. (Chico State Coll.) **Educational experience for**

the retarded blind. *Mental Retardation*, 1968(Dec), Vol. 6(6), 42-43.—Describes a concentrated program of activities for 21 severely retarded blind children who could not fit into the usual type of educational programs. The initial program's purpose was to learn what effects, if any, could be expected to accrue from the whole attention of 1 college student to 1 S in a school setting for a specified time concentrated in 2½ or 5 hr. daily. 17 college students, majors in education, psychology, and sociology were each assigned to 1 S for a 6-wk school session. Ss were encouraged to make their bodies perform skills like turning, bending, pushing, and pulling, and daily attention was concentrated on development of communication. Reaction to the program depended on variables, e.g., previous skills and toleration of session length. The more sophisticated Ss enjoyed all of the activities and remembered them from day to day. However, each S learned to do something that he might never have learned if this program had not involved him with 1 adult to teach him alone.—*M. Walker.*

4934. Kahn, Ernest J. **Handwriting and vision.** *Journal of the American Optometric Association*, 1969(Feb), Vol. 40(2), 156-161.—Illustrates, with the aid of unposed photographs, the relationship between poor pencil grip, poor posture, and certain visual problems. A method of retraining to overcome these handicaps is suggested. It is felt that proper handwriting and correct use of a pencil is necessary for overcoming myopia and certain learning difficulties.—*P. McMillan.*

4935. Lawrence, Elizabeth A. (Syracuse U.) **The effect of two classes of verbal reinforcement on the performance of subjects differing in locus of control.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5288-5289.

4936. Machikhina, V. F. (Ministry of Education, Moscow, USSR) **Pravil'nyi otbor i komplektovanie—vazhnoe zveno v rabote spetsial'nykh shkol.** [Correct selection and staffing are an important link in the work of the special schools.] *Defektologiya*, 1970, Vol. 2(1), 3-7.—There are 7 basic types of special schools in the USSR: for the blind, for the deaf, for the mentally retarded, for those with severe speech disorders, for the visually handicapped, for the hard-of-hearing, and for those with the sequelae of poliomyelitis and of cerebral palsies. The success of these schools depends on proper staffing and the proper placement of children. The situation in the non-Russian republics of the Soviet Union is discussed. Corrective measures are proposed.—*I. D. London.*

4937. Minasyan, A. M. (Armenian Ministry of Education, Erevan, USSR) **Obuchenie i vospitanie anomal'nykh detei v Armyanskoj SSR.** [The teaching and training of nonnormal children in Soviet Armenia.] *Defektologiya*, 1970, Vol. 2(1), 25-33.—Presents a historical survey of special education in Soviet Armenia with emphasis on current developments and programs.—*I. D. London.*

4938. Rousek, Joseph S. (Ed.) (Queensborough Community Coll., City U. New York) **The slow learner.** New York, N.Y.: Philosophical Library, 1969. vi, 373 p. \$10.—Presents articles by various authors discussing the problems of the slow learner, including the physical and social backgrounds of such children, the lack of connection between what is needed and what schools are actually providing, and current attempts at reform. The growing emphasis on innovation in education and the

search for new ways to challenge children in their social environments and in the classroom are discussed.

Gifted

4939. Jacobs, Jon C. (Plymouth, Community Schools, Mich.) **Are we being misled by fifty years of research on our gifted children?** *Gifted Child Quarterly*, 1970(Sum), Vol. 14(2), 120-123.—All the incoming kindergarten students for a total school district were selected as the study population and were individually tested before school entrance with the Wechsler Preschool and Primary Scale of Intelligence (WPPSI). Of the 654 Ss tested, 19 had Full Scale IQs of 125 or above. A group of 19 other Ss were randomly selected to serve as controls. After 5 mo. of school, the kindergarten teachers were asked to nominate those students who might be gifted. None of the 19 Ss with high IQs was nominated. Both groups were retested on the WPPSI and it was found that the high IQ group showed a significant loss on the Full Scale IQ. No significant change was noted for the control group. These data are used to call into question previous studies on the gifted based on teacher nomination rather than early testing of an entire study population.—*S. Krippner.*

Remedial Education

4940. Curry, Dal R. (U. Kansas) **The effect of two types of auditory discrimination training on language performance and acquisition in a culturally deprived preschool population.** *Dissertation Abstracts International*, 1970(Jan), Vol. 30(12-A), 5281-5282.

4941. Laurita, Raymond E. **Phonics vs. look-say: Is the end in sight?** *New York State Education*, 1967(Mar), Vol. 54(5), 48-51.—Reviews the evidence relating to deficiencies in reading, and attempts to draw conclusions and practical implications for reading instruction from what has been learned by reading specialists and remedial therapists. Difficulties in directionality, perception, association, discrimination, and memory are discussed; findings from laboratory and clinical studies are reviewed; and it is concluded that while merit exists in both reading methods, the educational system must adapt for general instruction techniques which enable children to learn sequentially.—*L. D. Summers.*

Sensory & Physical Handicaps

4942. Antonov, P. F. (Inst. of Defectology, Moscow, USSR) **Botanicheskaya ékskursiya po teme "Zhizn' rastenij vesnoi."** [Botanical excursion on the theme "Life of plants in springtime."] *Defektologiya*, 1970, Vol. 2(1), 58-62.—Presents an analysis of special activities connected with a botanical excursion by 9th graders in a school for the deaf.—*I. D. London.*

4943. Craig, Helen B. & Holland, Audrey L. (U. Pittsburgh) **Reinforcement of visual attending in classrooms for deaf children.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 97-109.—Examined the efficacy of immediate tangible reinforcement in increasing appropriate visual attending for entire classes of deaf children. Ss were 3 classes (7 children each) in a residential school for the deaf. Boxes were

installed on each S's desk, with lights that were flashed immediately contingent upon 10 sec. of visual attending. Light flashes were backed up by candy, cereal bits, or tokens. In 2 of the classes, extinction sessions were also scheduled. For all classes, the reinforcement procedure increased visual attending by 50% or more, maintaining it at rates above 82%. Withdrawal of tangibles decreased attending back to base-line levels. Results support analysis of attending as operant behavior and demonstrate the applicability of reinforcement procedures in modifying these behaviors for young deaf children in a classroom setting.—*Journal abstract.*

4944. Moor, Pauline M. **No time to lose: A symposium.** New York, N.Y.: American Foundation for the Blind, 1968. 53 p. \$1.35(paper).—Presents methods and techniques most successful in helping multiply impaired blind children reach their optimal potentials. These are illustrated by 3 case studies.

Mental Retardation & Learning Disorder

4945. ———. A. Ya. Rubinshtein—80 let. [80th birthday of A. Ya. Rubinshtein.] *Defektologiya*, 1970, Vol. 2(1), 89-90.—Recounts the life and work of Anna Yakovlevna Rubinshtein, a defectologist active in the development of teaching methods for use in schools for the mentally retarded.—*I. D. London.*

4946. ———. V. A. Gruzinskoi—80 let. [80th birthday of V. A. Gruzinskaya.] *Defektologiya*, 1970, Vol. 2(1), 88-89.—Recounts the life and work of Vera Alekseevna Gruzinskaya, a defectologist active in the development of programs and textbooks for schools for the mentally retarded.—*I. D. London.*

4951. McIvor, William B. (Columbia U.) **The comparative effects of hypothesis testing strategy training and paired associate training on the verbal abstraction performance of the educable mentally retarded.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 301-302.

4952. Mullins, June B. (U. Pittsburgh, Teacher Training Program for the Crippled & Other Health Impaired) **A rationale for visual training.** *Journal of the American Optometric Association*, 1969(Feb), Vol. 40(2), 139-143.—Discusses the role of the optometrist in the rehabilitation of the child with learning disabilities whose symptoms have been variously labeled as minimal brain damaged, dyslexic, or learning disabled. Visual training deals with primary learning problems encountered in the inefficient reading and writing of low-achievers. Training is directed toward perceptual defi-

ciencies which underlie the learning processes. An illustrative case history is presented. (18 ref.)—*P. McMillan.*

4953. Oliphant, Genevieve G. (United States International U., San Diego, Calif.) **A study of factors involved in early identification of specific language disability (dyslexia).** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 305-306.

4954. Pinskiĭ, B. I. (Inst. of Defectology, Moscow, USSR) **Zadachiĭ korrektsionno-vospitatel'noi raboty s umstvenno otstalymi shkol'nikami v protsesse trudovogo obucheniya.** [Goals of the corrective training of mentally retarded schoolchildren in the process of work education.] *Defektologiya*, 1970, Vol. 2(1), 13-19.—A psychologically and pedagogically based discussion. "Under the influence of work activity, viewed [by them] as useful in practice and socially valuable, there are formed in mentally retarded schoolchildren social motives and suitable methods of activity—motives and methods having an important significance for their general development and preparation for life at the end of school."—*I. D. London.*

4955. Schapiro, Judith S. (Memphis State U.) **An evaluation of the effects of different types of helping relationships on the self-concept and academic achievement of the educable mentally retarded pupils.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 254.

4956. Schreiber, Andrew. (Capuchino High School, San Bruno, Calif.) **An empirical approach at the secondary level.** *Academic Therapy*, 1970(Fal), Vol. 6(1), 5-12.—Presents methods and resources applicable in learning disability programs to avoid the continuing failure and poor self-image experienced by most emotionally handicapped or learning disabled students. New means of motivation and communication are emphasized. Requisites of a tutorial program are discussed using a special education program in a high school in San Bruno, California as an illustration. These general recommendations are made specific in reference to "the teaching of math to the learning disabled in a secondary school setting." It is concluded that "the entire framework, including the educational and social milieu" must be conducive to learning. (31 ref.)—*G. Steele.*

4957. Scott, Ralph; Kell, E. R., & Salisbury, Donald L. **Cognitive profiles of "retarded" children: A survey of inter- and intra child differences.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 288-292.—Assessed mental and educational profiles of "retarded" children. The results support the Jensen thesis that there are wide and significant inter- and intrachild differences in the profiles of retarded children's capabilities and their academic or readiness levels.—*H. Kaczowski.*

4958. Shane, Don G. (U. North Carolina) **The use of a specific instructional treatment method with young educable mentally retarded children.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 255.

4959. Sheehy, Mary S. (Kennedy Child Study Center, Santa Monica, Calif.) **Learning potential of the retarded child.** *Catholic Educator*, 1970, Vol. 40(6), 28-32.—Factors in the learning potential of the retarded child include (a) capacity limitations, (b) slow rate of development, (c) lessened amount and scope of learning, and (d) different applications of what is learned. The development of cognition, language, and social and emotional efficiency in light of the factors in the learning

potential suggests teacher attention to (a) uncomplicated learning situations, (b) emphasis on concrete aspects, (c) repetition for the sake of experience, and (d) clearly structured procedures. The retarded child is capable of learning and interpreting attitudes of others towards him, and these appreciations affect his learning ability.—A. M. Cawley.

4969. Schwarz, Michael L. & Hawkins, Robert P. **Application of delayed reinforcement procedures to the behavior of an elementary school child.** *Journal of*

Applied Behavior Analysis, 1970(Sum), Vol. 3(2), 85-96.—Applied delayed reinforcement techniques, in a multiple base-line experimental design, to modify the behavior of a mildly maladjusted 6th grade child. Face-touching, posture, and voice-loudness were chosen for modification. Videotape recordings were made of the S's behavior during mathematics and spelling periods each day. The recordings from the mathematics period was shown to S after school, and consequences for behavior exhibited during mathematics were dispensed during the after-school viewing. This delayed reinforcement procedure produced the desired behavior changes during the mathematics period. Tapes from the spelling period, which were taken without the S's knowledge, indicate that the behavior changes generalized to portions of the day other than the mathematics period.—*Journal abstract.*

COUNSELING & GUIDANCE

4970. Bevins, Sandra M. (Ball State U.) **A comparison of the effectiveness of individual and group counseling in the improvement of social adjustment of fifth and sixth grade children.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5277.

4982. Shann, Mary H. (Boston Coll.) **Multiple discriminant prediction of occupational choice of vocational high school boys based on inventoried and self-rated interest patterns.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 315-316.

4983. Shaw, Sarah F. (Indiana U.) **Empathy and its relationship to selected criteria of counselor effectiveness.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 163.

4984. Springer, Thomas A. (Ball State U.) **An experimental study of the effects of group counseling upon the creative thinking of selected senior high school students.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 165-166.

4985. Witmer, J. M. & Cottingham, H. F. (Florida State U.) **Teacher's role and guidance functions.** *Elementary School Guidance & Counseling*, 1970(Oct), Vol. 5(1), 12-21.—Attempted to: (a) determine to what extent classroom teachers were using certain guidance practices, (b) ascertain the value classroom teachers ascribed to these practices, and (c) ascertain how the classroom teachers perceived the improving of these practices. A stratified, representative sample of all Florida used 45 schools and 556 elementary teachers who responded to a 5-point Likert-type scale developed for this study. The data supported the hypothesis that the teacher's role should be given a central position in developing a team approach to elementary school guidance and counseling.—S. M. Amatora.

4986. Zaccaria, L. & Creaser, J. (U. Illinois, Chicago) **Personality differences between counseled and uncounseled students: A need for replication studies.** *Measurement & Evaluation in Guidance*, 1970, Vol. 3(3), 133-138.—Studies exploring personality characteristics of counseled and uncounseled students report

conflicting findings. The present research focuses on EPPS need differences between vocational-educational clients and nonclients in an urban commuter university. 108 male and 63 female freshmen and sophomores were Ss. The male client group was subdivided to provide replication. The experimental group differed significantly from the nonclient group on 5 need scales, whereas the replication group showed a significant difference for only 1 variable. More corroborative replication is needed to increase confidence in the validity of personality and counseling research.—S. M. Amatora.

4992. Bhogle, S. (Osmania U., Hyderabad, India) **Some factors in the adoption of educational innovations.** *Research Bulletin*, 1969, Vol. 5, 69-71.—Phi coefficients between early-late adoption and qualifications, number of institutions served, salary, work load, and sex groups, and a t test to find out the significance of difference between extreme groups of teaching experience and age showed that none of the background factors were correlated significantly with adoption practices, though qualification and salary suggested a positive relationship.—U. Pareek.

4993. Biggs, J. B. (U. Alberta, Edmonton, Canada) **Faculty patterns in study behaviour.** *Australian Jour-*

nal of Psychology, 1970(Aug), Vol. 22(2), 161-174.
—Constructed and administered a 72-item Study Behaviour Questionnaire (SBQ) to 314 prospective teachers, enrolled in the faculties of arts and science, before they had started university lectures and again just prior to the 1st-yr examinations. The items on the 1st administration were factor analyzed and 6 factors were obtained: a study organization factor, a motivational factor, and several cognitive style-type factors. The latter appeared to involve 2 main classes of study strategy: simplifying strategies, and opening-out strategies. The study organization factor was uncorrelated with performance, but there were consistent correlations, in the arts faculty only, between the remaining factors and performance. It is suggested that the general tasks demanded of arts and science students were different, and required different strategic approaches. (24 ref.)

4994. Cooper, Margaret L., Thomson, Carolyn L., & Baer, Donald M. (U. Kansas) **The experimental modification of teacher attending behavior.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 153-157.—Developed a method of observing and modifying teacher attention to appropriate child responses in preschool classrooms. 2 teachers with no formal training in reinforcement principles were observed for a base line of 8 days. Teacher A, who displayed a lower base-line rate of attending to appropriate child responses, was trained 1st. Teacher B was observed during the 1st part of the training condition for Teacher A. During training, A received feedback which included (a) definitions of appropriate child responses, (b) frequency of attending to appropriate child responses, (c) total percentage of attending to appropriate child responses, and (d) frequency of failing to attend to appropriate child responses. Teacher B was then trained in a similar way. Both teachers showed an increase in attending to appropriate child responses subsequent to the onset of experimental feedback.—*Journal abstract.*

5006. Smith, Charles F. (Michigan State U.) **A study of the attitudes of teachers in Title I and Non-Title I depressed area elementary schools toward pupil-teacher relations as measured by the Minnesota Teacher Attitude Inventory.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 85-86.

5007. Torbet, Sylvia L. (George Peabody Coll. for Teachers) **Influences of in-service instruction in uses of Bloom's taxonomy upon teacher behaviors, learner behaviors, and classroom interactions.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 241.

5008. Webster, Patricia A. (U. Maryland) **Teacher structure as it relates to the expression of sex-appropriate choices in nursery school children.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 243.

5009. Wiemayer, James D. (Fordham U.) **Transmission of values.** *Catholic Educator*, 1970, Vol. 40(6), 15-17, 35.—Attempted "to show that the teacher not only has the right to transmit values to his students, but that he also has the responsibility of integrating worthwhile values within his own personality because unwittingly or not he does transmit values He is one who is to teach people how to live Ideally the teacher would believe in, teach, and transmit those values which the parents also hold as important." Using acceptance of human beings as an example of a desirable value to be transmitted, the author projects the results probable if the viewpoint of Ezer whom he had quoted earlier, governed the technique. It is concluded that the place of the teacher as a transmitter of values along with the home and peer groups is higher than if his values are at odds with those of parents and peers.—A. M. Cawley.

5010. Wilson, Alfred P. (Utah State U.) **Personality characteristics of teachers in relation to performance in an individually prescribed instruction program.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5218.

5011. Zimmerman, Barry J. **Experimental training program effects on teacher verbal patterns.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 221-225.—Reports the impact of the Tucson, Arizona, early education model on the verbal behavior of those who participated in it. It was noted that graduates of the program showed a significantly greater incidence of corrective feedback than the control group. This finding supports the position of the program that teachers as well as pupils can be systematically shaped to perform select behaviors.—H. Kaczowski.

SCHOOL LEARNING & ACHIEVEMENT

5012. Ahluwalia, S. P. & Sidhu, N. (Kurukshetra U., India) **A study of personal problems of some adolescent girls and their effect on academic achievement.** *Journal of Psychological Researches*, 1969, Vol. 13(1), 56-57.—A study of 260 adolescent class 9 girls on a personal problem checklist showed that all Ss wished themselves to be healthy and beautiful. All 137 problems were checked by 1 or the other. Ss had a maximum number of problems in the areas of "school" and "society," and marked less problems in the area of health. Their opinions indicated that personal problems affect their academic performance effectively. Emotional problems appeared to affect academic achievement the most.—U. Pareek.

5013. Baldwin, Jean M. (U. Maryland) **An analysis of the relationship between self-esteem, academic achievement, and academic level of aspiration for a group of college students.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 209.

5014. Bennie, Donald E. (Indiana U.) **The use of praise and qualified praise in teaching disadvantaged children.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 211-212.

5015. Bruininks, Robert H. & Feldman, David H. **Creativity, intelligence, and achievement among disadvantaged children.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 260-264.—Investigated the relationship between creativity, intelligence, and achievement among southern disadvantaged children. Positive but low r 's (range .18 to .31) were shown between IQ and creativity. It was observed that the Torrance Test of

Creative Thinking acted as a suppressor variable in the study thereby increasing the relationship between IQ and achievement.—H. Kaczowski.

5016. Capone, Thomas A. (Fordham U.) **Interaction of selected needs and perceived peer orientation to education as related to academic proficiency in ASPIRA students.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5279.

5017. Coleman, Lois T. (U. California, Berkeley) **A study of the acquisition of the intellectual skill comparing in the area of social sciences.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 213-214.

5018. Collins, Maria A. (Fordham U.) **Achievement, intelligence, personality and selected school-related variables in Negro children from intact and broken families attending parochial schools in central Harlem.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5280-5281.

5019. Cotler, Sheldon & Palmer, Richard J. **The relationships among sex, sociometric, self, and test anxiety factors and the academic achievement of elementary school children.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 211-216.—156 4th-6th graders were used to test a series of hypotheses that appraised the S's receptiveness and responsivity to social reinforcement. Sarason's Test Anxiety Scale for Children, "The Class Play," teacher ratings, and school records were the sources for the basic data. It is concluded that: (a) sociometric status, visibility, and the self-concept of girls are positively related to academic performance while for boys the relationship was not significant; (b) a curvilinear relationship exists between incentive values and high test anxiety; and (c) intrinsic personality traits and external contingencies effect the child's responsiveness to social reinforcement.—H. Kaczowski.

5020. Dain, Robert N. (U. Texas) **Differential effects of effort- and ability-oriented reinforcers on children's academic performance.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5282.
